The prestigious science journal Nature noted in 1986:
[D]uring the period 1979-81, especially in western Europe where there is little fluoridation, a number of dental examinations were made and compared with surveys carried out a decade or so before. It soon became clear that large reductions in caries had been occurring in unfluoridated areas. The magnitudes of these reductions are generally comparable with those observed in fluoridated areas over similar periods of time

The Journal of the American Dental Association noted in 1988:
The current reported decline in caries tooth decay in the US and other Western industrialized countries has been observed in both fluoridated and nonfluoridated communities, with percentage reductions in each community apparently about the same

The Boston Globe reported in 1989:

The debate over fluoridating public water supplies, a measure long credited with producing a dramatic drop in tooth decay in the United States, is being rekindled by new studies suggesting the decline may have more to do with other causes, including other sources of fluoride.

The most exhaustive study ever conducted on the dental health of American children, conducted in 1986-87, has confirmed the great decline in cavities in the last 10 years, but it found much less difference than expected between areas with and without fluoridated water.

The Journal of Public Health Dentistry noted in 1991:
During the past 40 years dental caries has been declining in the US, as well as in most other developed nations of the world... The decline in dental caries has occurred both in fluoride and in fluoride-deficient communities, lending further credence to the notion that modes other than water fluoridation, especially dentrifices, have made a major contribution.

The Critical Review of Oral Biology and Medicine noted in 2002:

It is remarkable, however, that the dramatic decline in dental caries which we have witnessed in many different parts of the world (for reviews, see Glass, 1982; Fejerskov and Baelum, 1998) has occurred without the dental profession being fully able to explain the relative role of fluoride in this intriguing process. It is a common belief that the wide distribution of fluoride from toothpastes may be a major explanation (Bratthall et al., 1996), but serious attempts to assess the role of fluoridated toothpastes have been able to attribute, at best, about 40-50% of the caries reduction to these fluoride

products (Marthaler, 1990; Scheie, 1992). This is not surprising, if one takes into account the fact that dental caries is not the result of fluoride deficiency.

The International Society of Fluoride Research noted in 2005:
Graphs of tooth decay trends for 12 year olds in 24 countries, prepared using the most recent World Health Organization data, show that the decline in dental decay in recent decades has been comparable in 16 nonfluoridated countries and 8 fluoridated countries which met the inclusion criteria of having (i) a mean annual per capita income in the year 2000 of US$10,000 or more, (ii) a population in the year 2000 of greater than 3 million, and (iii) suitable WHO caries data available. The WHO data do not support fluoridation as being a reason for the decline in dental decay in 12 year olds that has been occurring in recent decades.

The British Medical Journal noted in a 2007 paper:
Although the prevalence of caries [i.e. cavities] varies between countries, levels everywhere have fallen greatly in the past three decades, and national rates of caries are now universally low. This trend has occurred regardless of the concentration of fluoride in water or the use of fluoridated salt, and it probably reflects use of fluoridated toothpastes and other factors, including perhaps aspects of nutrition.

Clinical Oral Investigations noted in 2007:
In most European countries, where community water fluoridation has never been adopted, a substantial decline in caries prevalence has been reported in the last decades, with reductions in lifetime caries experience exceeding 75%.
And the Globe and Mail wrote last year:
There has also been a worldwide reduction in cavity rates, regardless of whether countries use the chemical, suggesting factors other than adding it to water supplies are at work.
And data published by the World Health Organization shows this dramatic plunge in cavities in virtually all countries (chart courtesy of Chris Neueth, Fluoride Action Network):

When Fluoridation Is Stopped, Cavities Do Not Increase

Further evidence of the ineffectiveness of water fluoridation is that the scientific literature shows that - when fluoridation of water supplies is stopped - cavities do not increase (but may in some cases actually decrease). See this, this, this, this, this and this.

Prominent Pro-Water Fluoridation Experts Have Changed Their Mind

Several prominent leaders of the pro-water fluoridation movement have recently admitted publicly that they were wrong, including:

John Colquhoun, DDS, Principal Dental Officer for Auckland, New Zealand and chair of that country's Fluoridation Promotion Committee, reviewed New Zealand's dental statistics in an effort to convince skeptics that fluoridation was beneficial and found that tooth decay rates were the same in fluoridated and nonfluoridated places, which prompted him to re-examine the classic fluoridation studies. He withdrew his support for it in "Why I Changed my Mind About Water Fluoridation" (Perspectives in Biology and Medicine 1997;41:29—44).
Richard G. Foulkes, MD, a health care administrator and former assistant professor in the Department of Health Care and Epidemiology at the University of British Columbia also switched from pro to anti-water fluoridation after studying the issue.
And Dr. Hardy Limeback PhD, DDS - one of the 12 scientists who served on the 2006 National Academy of Sciences review of fluoride, and Head of Preventive Dentistry at University of Toronto - wrote "Why I am Now Officially Opposed to Adding Fluoride to Drinking Water."

And see this testimony to Congress by PhD chemist William Hirzy, who - at the time of the hearing - was Senior Vice-President of the union representing EPA toxicologists, biologists, chemists, engineer and lawyers:

If It's Not Fluoride in Water, Why Are Cavities Decreasing?

If it's not water fluoridation, then what is causing cavity levels to dropping worldwide?

No one knows, but scientists have proposed different explanations. See, for example, this:
The causes for the changed caries trend were seen on the one hand in improvements in attitudes towards oral health behaviour and, on the other hand, to the broader availability and application of preventive measures [including fluoride toothpaste].
And this:
Dr. Limeback said factors that might be preventing caries include increased exposure to vitamin D, better oral hygiene, less sugar consumption, and even antibiotics.
And this:
Factors other than fluoride, such as food additives and antibiotics, may have contributed.
And this:
The caries decline is probably caused by a broader availability of fluorides [in toothpaste], a high level of individual dental curative and preventive care (fissure sealings) and by changed oral health behaviour and nutritional habits. Reference is made to a possible tangent between a high level of antibiotics consumption and the virulence of oral pathogenic streptococci.
Why Should We Care?

Who cares if water fluoridation isn't effective in preventing cavities?

Well, new evidence demonstrates that fluoride is extremely toxic: it can cause cancer, damage liver, kidneys, endocrine systems, and even lower IQ.

Moreover, several scientific studies have found that the type of fluoride added to most water supplies (mainly obtained as an industrial byproduct from phosphate fertilizer plants) is more toxic than the type added to toothpaste, and may contain lead, arsenic and other heavy metals.

So if water fluoridation may be doing a lot of harm but no good in fighting cavities, isn't that contrary to good science?

Afterword: I am NOT Against Fluoride Toothpaste

While I am against adding fluoride to water, I am not against people using fluoridated toothpaste if they wish.

Topical application of fluoride - with toothpastes, gels or rinses - gets more fluoride to the teeth and less to the body as a whole.

The Centers for Disease Control noted in a 1999 report:
Laboratory and epidemiologic research suggests that fluoride prevents dental caries predominately after eruption of the tooth into the mouth, and its actions primarily are topical for both adults and children.

Dr. Arvid Carlsson - Nobel prize winner in medicine in 2000 - points out (in a brief, must-watch video) that water fluoridation goes against all principles of pharmacology, because fluoride works topically on teeth, not by oral ingestion.

A petition signed by Dr. Carlsson, as well as three members of the prestigious 2006 National Research Council (NRC) panel that reported on fluoride's toxicology, two officers in the Union representing professionals at EPA headquarters, the President of the International Society of Doctors for the Environment, and hundreds of medical, dental, academic, scientific and environmental professionals, worldwide, states:

The CDC [conceded], in 1999 and 2001, that the predominant benefit of fluoride in reducing tooth decay is TOPICAL and not SYSTEMIC. To the extent fluoride works to reduce tooth decay, it works from the outside of the tooth, not from inside the body. It makes no sense to drink it and expose the rest of the body to the long term risks of fluoride ingestion when fluoridated toothpaste is readily available.

Fluoride’s topical mechanism probably explains the fact that, since the 1980s, there have been many research reports indicating little difference in tooth decay between

fluoridated and non-fluoridated communities ....
The Globe and mail noted last year:

When fluoridation started 60 years ago, doctors thought swallowing the chemical was beneficial by strengthening teeth from the inside out. Dr. Limeback said more recent research shows that if there is a benefit, it is from the topical application of fluoride to the surface of teeth, which suggests that brushing with a toothpaste is more effective than drinking water containing the chemical.
Professor Aubrey Sheiham - Emeritus Professor of Dental Public Health at the University College London - writes:
Fluoride, particularly in toothpastes, is a very important preventive agent against dental caries. Toothbrushing without fluorides has little effect on caries. As additional fluoride to that currently available in toothpaste does not appear to be benefiting the teeth of the majority of people, the main strategy to further reduce the levels of caries, is reducing the frequency of sugars intakes in the diet.
Time Magazine notes:
Because toothpaste is designed to be spit out, it's a more efficient way to get the decay-fighting ingredient where it is needed and nowhere else. Even some dentists, who see firsthand the benefits of fluoridation, wonder whether people who get fluoride from toothpaste should get it in their drinking water as well.
ABC News' medical and scientific journalist, Nicholas Regush, writes
The fluoride is in your toothpaste to fight cavities. When it comes into direct contact with teeth, fluoride appears to help. The much bigger questions are whether we need to fluoridate the entire water supply to achieve this and whether water fluoridation, an indirect method to fight cavities, actually works.

***

What is amazing, however, is that public health policy in this country has allowed water fluoridation to continue in the absence of solid scientific evidence that its benefit is greater than its risk.

When you commit to putting a powerful chemical into the water supply, you'd better have the best of evidence that it is both safe and effective. The required level of evidence is just not there.
Similarly, the Environmental Working Group - a science-based group which has conducted research into and helped publicize many toxic chemical dangers, such as Bisphenol A and drinking water pollution - says:
The Environmental Working Group supports the use of fluoride in toothpaste, where there is strong evidence of its effectiveness. But EWG's analysis concludes that fluoridation of public water supplies should end, because the risks outweigh possible benefits, especially for infants and young children, because they consume more water than adults relative to their size.
And the Sierra Club notes:

The Sierra Club understands the historic reason that fluoridation of public water supplies has been promoted .... There are now, however, valid concerns regarding the potential adverse impact of fluoridation on the environment, wildlife, and human health.

Therefore, the Sierra Club believes that communities should have the option to reject mandatory fluoridation of their water supplies.
To protect sensitive populations, and because safer strategies and methods for preventing tooth decay are now available, we recommend that these safer alternatives be made available and promoted.

TheUnhivedMind - January 20, 2011 02:07 AM (GMT)

Southampton's fluoridation decision 'unlawful'

Fluoridation supporters say the move would reduce tooth decay

19 January 2011 Last updated at 13:22
http://www.bbc.co.uk/news/uk-england-hampshire-12223552

A health authority tried to illegally force the fluoridation of Southampton's water, the High Court has heard.

Resident Geraldine Milner is taking legal action to challenge the decision made in 2009 by the South Central Strategic Health Authority (SCSHA).

The SCSHA, which believes the move will improve dental health, gave the go-ahead despite a public consultation showing 72% opposed the idea.

The judicial review will decide if SCSHA properly considered the views.

Ms Milner's counsel David Wolfe told a judge that, if the scheme goes ahead, the mother of three teenagers would be left "with no choice but to drink water to which fluoride has been added".

As opponents of fluoridation demonstrated outside the Royal Courts of Justice in London, Mr Wolfe said approximately 195,000 people in Southampton and parts of south-west Hampshire "would have fluoride added to their water whether they liked it or not".
'Legal obligation'

He told Mr Justice Holman this was contrary to government policy that no new

fluoridation schemes should be introduced unless it could be shown that the local population was in favour.

The SCSHA used statutory powers to instruct Southern Water, the local water provider, to go ahead with fluoridation in February 2009 to improve dental health.

The decision came after 72% of those who responded to a public consultation opposed fluoridation, with just 28% in favour.

An opinion poll commissioned by the SCSHA produced a narrower result, with 38% against the scheme and 32% in favour and 29% "don't knows", the court heard.

Mr Wolfe accused the SCSHA of failing in its legal obligation to properly assess the cogency of the arguments for and against mass fluoridation.

He said the application for judicial review was not about the actual merits and health arguments over fluoridation.

It was about the legality of the compulsory scheme, the first of its kind in the UK for 20 years.

Mr Wolfe said: "Four out of five local authorities and three out of four local MPs expressed their opposition within the consultation process.

"Ms Milner is in good company, whether she is right or wrong."

The health authority is opposing Ms Milner's legal challenge.

The hearing continues.

TheUnhivedMind - January 20, 2011 02:13 AM (GMT)

The simply question to ask folks is why are they so worried about your teeth when they have no worries about Cancer being soon within 1 in 2 of the populace? Hows about Heart disease and all the other major killers? Hows about the added Cancers through Fluoride? What about all the Osteo care/surgery and so forth from Fluorides damaging effects? How dare these bastards claim its simply to aid our teeth. These bastards controlling everything want to kill off at least 50-60% of us by 2050. Do you still honestly believe they care about your teeth? They want the highly dangerous chemical pesticide, Fluoride within you, killing you slowly and controlling your mind making you a passive moron serf which nothing by apathy whilst the slave masters laugh at their control. Drinking 250ml of Fluoride tap water is the equivalent of taken a pea size of toothpaste. When one has the toothpaste ingested you're told to call poison control immediately but if you ingest water in the same amount or more its perfectly

fine. Use your common sense and mind for once people. Study Paul Connett to see through this bloody farce:

Feds Say Too Much Fluoride in Drinking Water

Jan 7, 2011 – 10:32 AM
Mike Stobbe
http://www.aolnews.com/2011/01/07/feds-say...drinking-water/

ATLANTA - Fluoride in drinking water - credited with dramatically cutting cavities and tooth decay - may now be too much of a good thing. It's causing spots on some kids' teeth.

A reported increase in the spotting problem is one reason the federal government will announce Friday it plans to lower the recommended limit for fluoride in water supplies - the first such change in nearly 50 years.

About 2 out of 5 adolescents have tooth streaking or spottiness because of too much fluoride, a surprising government study found recently. In some extreme cases, teeth can even be pitted by the mineral - though many cases are so mild only dentists notice it.

Health officials note that most communities have fluoride in their water supplies, and toothpaste has it too. Some kids are even given fluoride supplements.

The U.S. Department of Health and Human Services is announcing a proposal to change the recommended fluoride level to 0.7 milligrams per liter of water. And the Environmental Protection Agency will review whether the maximum cutoff of 4 milligrams per liter is too high.

The standard since 1962 has been a range of 0.7 to 1.2 milligrams per liter.

The Centers for Disease Control and Prevention reports that the splotchy tooth

condition, fluorosis, is unexpectedly common in kids ages 12 through 15. And it appears to have grown much more common since the 1980s.

"One of the things that we're most concerned about is exactly that," said an administration official who was not authorized to speak publicly before the release of the report. The official described the government's plans in an interview with The Associated Press.

The government also is expected to release two related EPA studies which look at the ways Americans are exposed to fluoride and the potential health effects. This shift away from government's long-standing praise of the benefits of fluoride is sure to re-energize groups that still oppose it.

Fluoride is a mineral that exists naturally in water and soil. Scientists in the early 1940s discovered that people who lived where water supplies naturally had more fluoride also had fewer cavities. Some locales have naturally occurring fluoridation levels above 1.2.

Today, most public drinking water supplies are fluoridated, especially in larger cities. Counting everyone, including those who live in rural areas, about 64 percent of Americans drink fluoridated water.

Fluoridation has been fought for decades by people who worried about its effects, including conspiracy theorists who feared it was a plot to make people submissive to government power.

Maryland is the most fluoridated state, with nearly every resident on a fluoridated water system. In contrast, only about 11 percent of Hawaii residents are on fluoridated water, according to government statistics.

Drinking water patterns have changed over the years, so that some stark regional differences in fluoride consumption are leveling out. There was initially a range in recommended levels because people in hotter climates drank more water. But with air conditioning and sodas, Americans in the South and Southwest don't necessarily consume more water than those in colder states, said one senior administration official.

Fluorosis is considered the main downside related to fluoridation.

According to the CDC, nearly 23 percent of children ages 12-15 had fluorosis in a study done in 1986 and 1987. That rose to 41 percent in the more recent study, which covered the years 1999 through 2004.

"We're not necessarily surprised to see this slow rise in mild fluorosis," Dr. William Kohn, director of the CDC's division of oral health, said in a recent interview.

Health officials have hesitated to call it a problem, however. In most kids, it's barely noticeable; even dentists have trouble seeing it, and sometimes don't bother to tell their unknowing patients. Except in the most severe cases, health officials considered the discoloring of fluorosis to be a welcome trade-off for the protection fluoride provides against cavities.

"One of water fluoridation's biggest advantages is that it benefits all residents of a community - at home, work, school, or play. And fluoridation's effectiveness in preventing tooth decay is not limited to children, but extends throughout life, resulting in improved oral health," said HHS Assistant Secretary for Health Dr. Howard Koh, in a statement.

Indeed, many health leaders continue to be worried about cavities, particularly among poor families with kids who eat a lot of sweets but don't get much dental care. The American Public Health Association in November adopted a resolution calling for coordinated programs to be established at public health, dental and medical clinics to offer fluoride varnish - a highly concentrated lacquer painted on teeth to prevent cavities.

Secretary Kathleen Sebelius could make a final decision within a few months, the administration official said.

Phazon - January 16, 2011 08:44 AM (GMT)

There saying this now because people are finding out and they don't want to be held liable for not warning the public of the danger.

TheUnhivedMind - January 20, 2011 12:01 AM (GMT)

Maybe they just want to calm people down and either remove it from the water supply or simply drop the standard amount a lot more down. This will shut up the sheople more and all whilst they load you up more via the foods and products you buy in the stores. Thats if people are stupid enough to buy and consume anything with a Satanic barcode on the side which will soon be a RFID chip.

Description: *allow more input*

TheUnhivedMind - January 16, 2011 04:10 AM (GMT)

Calgary fluoride debate delayed to Jan. 26 to allow more input

By Jason Markusoff, Calgary Herald January 11, 2011
http://www.calgaryherald.com/health/Calgar...l#ixzz1AlDYhvzu

Council will delay deciding on the future of fluoride in Calgary's water system until a public hearing later this month, but one aldermen questions whether members' minds are already made up and that a hearing would be largely ceremonial.

Ten of 15 aldermen had lent signatures to a motion Monday that would have ended Calgary's 20 years of fluoridation without any formal public input.

But amid deluges of hundreds of e-mails and calls from across North America on the divisive issue last week, as well as criticism from the mayor, council decided a Jan. 26 hearing will let experts and residents hash out the debate that mixes health, science and ethics.

As they embraced the idea of a hearing, many aldermen expressed their determination to remove the additive from city water -- a juxtaposition Ald. Gael MacLeod found upsetting.

"What is the point of . . . having a debate if no one is listening?" she asked in council.

"The purpose of having a public hearing is to become informed, and what I hear is a lot of council members saying they have the information they want," MacLeod told the Herald later.

"I don't hear much of anything that sounds like people are open to changing their minds or to getting more information."

MacLeod said last week she's unsure on her stance.

Ald. Jim Stevenson offered a rebuttal to MacLeod, but at the same time signalled he has never been swayed by the medical establishment's steady support of fluoride in water to prevent tooth decay.

"I am open, but I'll tell you that over the last 30 years, nothing has convinced me to change my mind," he said.

Two members, Brian Pincott and John Mar, said council should have decided right away and didn't need to seek public input.

Both strongly oppose fluoride treatment in Calgary's water, and said the provincial authorities who advocate for it should pay for it.

Of the members who weren't behind the anti-fluoride motion, only Ald. Gord Lowe voiced any sort of determined stance to maintain the city's current water treatment.

The debate has lumbered through Calgary politics for five decades, with a string of plebiscites, including the 1989 vote that endorsed fluoridation, and a pitch made by Ald. Druh Farrell in 2009 that failed 7-6 in council.

Farrell delayed her renewed proposal Monday, arguing: "People want the opportunity to express their point of view."

She said the two sides of the debate have stopped listening to each other, but she argued the anti-fluoride forces have become more persuasive and gathered more evidence in recent years.

While the ethical question over mass medication via the water supply has long been a pivotal concern by anti-fluoridation advocates, various medical studies over the years have argued fluoride can cause everything from weaker bones to lower intelligence in children.

Dr. Richard Musto of Alberta Health Services acknowledged such studies exist but noted that countries regularly review the information and always conclude that the low fluoride dosage in water is safe and beneficial.

"You have the appearance of disagreement, the appearance of debate, when in fact all of the major health and dental authorities in the world support it," Musto said. "However, we're all going to get our five minutes."

Mayor Naheed Nenshi, who wasn't among the 10 council members eager to ditch fluoridation, said he'll be at a mayors' gathering in Regina and miss this month's fluoride

hearing.

At least one alderman's views have changed: Ald. Diane Colley-Urquhart supported keeping fluoride in the city's water in 2009, but she now stands alongside Farrell against it and said Calgary doesn't need it.

Although she said a public hearing is necessary on this hot-button issue, Colley-Urquhart offered a grim view of how it would unfold.

"It will probably be evenly divided, and everyone trashes the others' science," the alderman and registered nurse said.

There's mixed view on a plebiscite, with many aldermen against bringing it to another citywide vote.

jmarkusoff@calgaryherald.com

TheUnhivedMind - January 16, 2011 04:12 AM (GMT)

So thats the new trick folks, if the scientists wake up then the elitists will create an issue with the sheople. These sheople have no idea what their talking about but yet again will continue to police themselves with pseudo-science brainwashing.

View Full Version: Fluoride in Water Linked to Lower IQ in Children

Title: Fluoride in Water Linked to Lower IQ in Children

TheUnhivedMind - December 23, 2010 04:32 AM (GMT)

Fluoride in Water Linked to Lower IQ in Children

December 22, 2010
http://www2.fluoridealert.org/Alert/China/...-IQ-in-Children

Exposure to fluoride may lower children's intelligence says a study pre-published in Environmental Health Perspectives, a publication of the National Institute of Environmental Health Sciences (online December 17, 2010).

Fluoride is added to 70% of U.S. public drinking water supplies.

According to Paul Connett, Ph.D., director of the Fluoride Action Network, “This is the 24th study that has found this association, but this study is stronger than the rest because the authors have controlled for key confounding variables and in addition to correlating lowered IQ with levels of fluoride in the water, the authors found a correlation between lowered IQ and fluoride levels in children’s blood. This brings us closer to a cause and effect relationship between fluoride exposure and brain damage in children.”

“What is also striking is that the levels of the fluoride in the community where the lowered IQs were recorded were lower than the EPA’s so-called ‘safe’ drinking water standard for fluoride of 4 ppm and far too close for comfort to the levels used in artificial fluoridation programs (0.7 – 1.2 ppm),” says Connett.

In this study, 512 children aged 8-13 years in two Chinese villages were studied and tested – Wamaio with an average of 2.47 mg/L water fluoride (range 0.57-4.50 mg/L) and Xinhuai averaging 0.36 mg/L (range 0.18-0.76 mg/L).

The authors eliminated both lead exposure and iodine deficiency as possible causes for the lowered IQs. They also excluded any children who had a history of brain disease or head injury and none drank brick tea, known to contain high fluoride levels. Neither village is exposed to fluoride pollution from burning coal or other industrial sources.

About 28% of the children in the low-fluoride area scored as bright, normal or higher intelligence compared to only 8% in the “high” fluoride area of Wamaio.

In the high-fluoride city, 15% had scores indicating mental retardation and only 6% in the low-fluoride city.

The study authors write: “In this study we found a significant dose-response relation between fluoride level in serum and children’s IQ.”

EXCLUSIVE INFOWARS.COM INTERVIEW WITH DR. PAUL CONNETT – YOUR TOXIC TAPWATER

[dohtml]<object width="640" height="390"><param name="movie" value="http://www.youtube.com/v/3Ky9nkltews&hl=en_US&feature=player_embedded&version=3"></param><param name="allowFullScreen" value="true"></param><param name="allowScriptAccess" value="always"></param><embed src="http://www.youtube.com/v/3Ky9nkltews&hl=en_US&feature=player_embedded&version=3" type="application/x-shockwave-flash" allowfullscreen="true" allowScriptAccess="always" width="640" height="390"></embed></object>[/dohtml]

In addition to this study, and the 23 other IQ studies, there have been over 100 animal studies linking fluoride to brain damage (all the IQ and animal brain studies are listed in Appendix 1 in The Case Against Fluoride available online at http://fluoridealert.org/caseagainstfluori...ppendices.html).

One of the earliest animal studies of fluoride’s impact on the brain was published in the U.S. This study by Mullenix et. al (1995) led to the firing of the lead author by the Forsyth Dental Center. “This sent a clear message to other researchers in the U.S. that it was not good for their careers to look into the health effects of fluoride – particularly on the brain,” says Connett.

Connett adds, “The result is that while the issue of fluoride’s impact on IQ is being aggressively pursued around the world, practically no work has been done in the U.S. or other fluoridating countries to repeat their findings. Sadly, health agencies in fluoridated countries seem to be more intent on protecting the fluoridation program than

protecting children's brains."

When the National Research Council of the National Academies reviewed this topic in their 507-page report "Fluoride in Drinking Water: A Review of EPA's Standards" published in 2006, only 5 of the 24 IQ studies were available in English. Even so the panel found the link between fluoride exposure and lowered IQ both consistent and "plausible."

According to Tara Blank, Ph.D., the Science and Health Officer for the Fluoride Action Network, "This should be the study that finally ends water fluoridation. Millions of American children are being exposed unnecessarily to this neurotoxin on a daily basis. Who in their right minds would risk lowering their child's intelligence in order to reduce a small amount of tooth decay, for which the evidence is very weak." (see The Case Against Fluoride, Chelsea Green, October 2010)

—

This just in from Dr. Paul Connett (The Case Against Fluoride) and the Fluoride Action Network: A very important study, titled Serum Fluoride Level and Children's Intelligence Quotient in Two Villages in China, was pre-published by Environmental Health Perspectives (EHP) on Dec 17, 2010 (EHP is published by the U.S. National Institute of Environmental Health Sciences).

In this study, Xiang and co-workers from China found an inverse correlation between the level of fluoride in children's blood and their IQ. Specifically, Xiang et al. show that in a village in an area endemic for fluorosis that the higher the fluoride in the children's blood the lower the IQ of the children studied. In addition, the level of the fluoride in the children's blood was strongly correlated with the level of the naturally occurring fluoride in their water. Please note, that the levels of the fluoride in the water in the village studied (Wamiao, Jiangsu Province, China) were not that high 2.47 +/- 0.79 ppm (range 0.57-4.50). These levels are actually lower than the EPA's so-called safe drinking water standard for fluoride (4 ppm). Previously Xiang had reported that a linear regression analysis of their data indicated that IQ would occur at levels as low as 1.9 ppm fluoride in the water (Xiang, 2003a,B). For a study that involved about 200 children this does not leave anything like an adequate margin of safety to protect the millions of children drinking artificially fluoridated water at 1 ppm. Finding a correlation between fluoride in the blood and lowered IQ further strengthens Xiang's earlier findings.

Moreover, this study does not come out of the blue. It is the 24th study that has found an association between fluoride in water and lowered IQ in children. Most of these have come from China, but they also include studies published in Mexico, India and Iran. There have also been over 100 studies that fluoride can damage animal brain and studies showing that the fetal brain has been damaged in aborted fetuses in areas of China endemic for fluorosis. A complete listing of these studies can be found in

Appendix 1 of the book “The Case Against Fluoride…” which is available online, with permission from the publisher.

One of the earliest animal studies of fluoride’s impact on the brain in the U.S. was by Mullenix et al. (1995). This led to the firing of the lead author by the Forsyth Dental Center (the details of this are in Chris Bryson’s book The Fluoride Deception). This treatment sent out a clear message to other researchers in the U.S. that it was not good for their careers to look into the health effects of fluoride – particularly on the brain!

When the National Research Council reviewed this topic in their 507-page report “Fluoride in Drinking Water: A Review of EPA’s Standards” published in 2006, only 5 of the IQ studies were available in English. Even so the panel found the link between fluoride exposure and lowered IQ both consistent and “plausible.” There have now been another 19 studies that have since been published or become available via English translation.

Risk-benefit analysis. Let’s put two studies in the weighing pans of a risk-benefit analysis. In the left hand pan let’s put the largest US study purporting to demonstrate fluoridation’s benefit (Brunelle and Carlos,1990) and in the right hand pan let’s put this study by Xiang, and see where the balance of wise policy lies.

The left hand pan. The Brunelle and Carlos study indicates that comparing tooth decay between children who had lived all their lives in a fluoridated community (versus a non-fluoridated one) had an average saving (for 5-17 year olds) of 0.6 of one permanent tooth surface out of over 100 tooth surfaces in a child’s mouth. Not only was this miniscule saving not shown to be statistically significant but it completely disappears if a one-year delay occurs in the eruption of the teeth of the children in the fluoridated communities (for which there is some evidence).

The right hand pan. The Xiang study (2003 a,B) indicates that their might be a lowering of IQ at 1.9 ppm, allowing an inadequate margin of safety to protect all children drinking uncontrolled amounts of water at 1 ppm (and getting fluoride from other sources). Now Xiang et al’s (2010) study strengthens this original finding by relating lowered IQ to plasma fluoride levels, which brings the finding closer to individual exposure.

Could either a parent or a decision maker possibly justify a practice that may possibly lower tooth decay by a very small amount, while it may possibly be risking their mental development? Surely the right hand scale pan must tip the left in this analysis?

Blaylock: Fluoride's Deadly Secret

Paul Joseph Watson
November 29, 2010
http://www.infowars.com/blaylock-fluorides-deadly-secret/

Dr. Russell Blaylock M.D. is a retired neurosurgeon and author whose trailblazing research has tirelessly documented the fact that there is an epidemic of neurological disorders in the western world which are directly connected to toxins in our environment, and how this relates to the larger global eugenics program behind population reduction. In this fascinating interview, Blaylock reveals how depopulation programs forged by the Rockefeller foundation in association with the Nazis were the basis of modern day incarnations of eugenics like fluoride poisoning and vaccinations.

Blaylock explains how the eugenics movement began in America through Rockefeller, Ford and Carnegie funding and what originated as The Science of Man project, which was an effort to socially engineer humanity to weed out those deemed "undesirable" to the elite. Rockefeller funding via major universities then bankrolled eugenics programs for the next several years, information about which was gleaned and exchanged with the Nazis in Hitler's Germany. Once eugenics had attracted the negative connotations of racial superiority and genocide, the pseudo-science was reborn under the umbrella of molecular biology and DNA.

The goal is to alter behavior by chemically changing the way in which the brain functions. One of the primary methods through which this is achieved is by fluoridating water and food supplies. Blaylock explains how fluoride opportunists seized upon falls in dental cavities, which were occurring naturally as a result of increased calcium intake and better diets in the west, to claim that mass fluoridation was the answer, while burying a plethora of studies that proved adding fluoride to water did not reduce cavities

at all and in fact in several instances increased dental cavities.

Blaylock highlights how independent study after study has shown that fluoride increases cancer rates, increases bone disorders, which as Blaylock points out is a good way of increasing mortality rates amongst the elderly, and also leads to profound neurological disorders. Blaylock highlights the research of Phyllis Mullenix, Ph.D, who during her tenure at Harvard University conducted one of the largest studies into fluoride's effects on the brain in animals. Mullenix found that offspring of animals who had been fed fluoride became hyperactive (ADHD) and that if you gave an animal fluoride after birth they became very lethargic and apathetic. Mullenix discovered that fluoride tends to accumulate in the part of the brain that controls behavior. After revealing the truth about fluoride, Mullenix was later shunned and attacked by the medical establishment that she had once been a part of.

Blaylock delves into the dangers of vaccines and how they are part of the eugenics assault, pointing out that America's infant mortality rates are impossibly high for a nation that is supposed to be a global leader in health care. Blaylock puts the number down to the fact that American babies are now being shot up with more vaccines than ever before, the rising number of which correlates exactly with levels of infant mortality. "When you over-vaccinate, it interferes with the development of the brain and then the child has difficulty learning, they have behavioral problems, and their brain cannot develop normally," states Blaylock.

This is a key interview to watch if you want to get a firm grasp of how we are under attack from modern day eugenics. Blaylock frames the information in clear and easily understood verbiage so everyone can obtain a coherent understanding of how we are being targeted and what we can do to defend ourselves against this chemical and behavioral assault on humanity.

CDC and ADA Now Advise to Avoid Using Fluorid

Published on 11-15-2010 Email To Friend Print Version
http://articles.mercola.com/sites/articles...g-fluoride.aspx

A new study in the Journal of the American Dental Association finds once again that, contrary to what most people have been told, fluoride is actually bad for teeth.

Exposure to high levels of fluoride results in a condition known as fluorosis, in which tooth enamel becomes discolored. The condition can eventually lead to badly damaged teeth. The new study found that fluoride intake during a child's first few years of life is significantly associated with fluorosis, and warned against using fluoridated water in infant formula.

The Centers for Disease Control and Prevention (CDC) is of a similar opinion. According to their website:

"Recent evidence suggests that mixing powdered or liquid infant formula concentrate with fluoridated water on a regular basis may increase the chance of a child developing ... enamel fluorosis."

Fighting Fluoride

Donald W. Miller, Jr., MD
November 9, 2010
http://www.lewrockwell.com/miller/miller35.1.html

The battle for and against fluoridation of the public water supply has entered a new phase. Three things have happened since I researched and wrote “Fluoride Follies” five years ago.

In their efforts to have all the community drinking water in the U.S. fluoridated, promoters of fluoridation are taking a different tact. Rather than grapple with community-level politics and local referendums on this matter, they are increasingly targeting state legislators and are pushing for statewide mandates to fluoridate the public water supply.

A second development has inflicted a chink in the Federal Government’s armor against antifluoridationists. The Office of Drinking Water in its Environmental Protection Agency (EPA) commissioned the government’s National Research Council (NRC) to examine the toxicology of fluoride. It was commissioned to assess the EPA’s 4 ppm (parts per million) maximum contaminant level goal, along with its 2 ppm secondary maximum contaminant level, a level set to keep children from having unsightly dental fluorosis, where white specks form on teeth, and with further fluoride exposure become confluent and turn brown. The council’s 506-page report was published in 2006. It unflinchingly faces up to the health-damaging effects of fluoride in public water.

The third development is the publication, in September 2010, of The Case Against Fluoride: How Hazardous Waste Ended Up in Our Drinking Water and the Bad Science and Powerful Politics That Keep It There by Paul Connett, PhD, the director of the Fluoride Action Network; James Beck, MD, PhD, Professor Emeritus of Medical Biophysics at the University of Calgary, Canada; and H. S. Micklem, DPhil, Professor

Emeritus in the School of Biological Sciences at the University of Edinburgh, UK. The Case Against Fluoride is well-written, which makes it easy to read; and it is comprehensive, citing more than 1700 references, pro and con, dealing with fluoridation of public water. This book is the ideal litigator's brief for prosecuting the case against fluoride.

Most Americans, 269 million in a population of 304 million (88.5 %), get their water from public water systems, and 196 million (72.4 %) drink – and bathe and wash their clothes with – fluoridated water. Maryland is the most heavily fluoridated state, where 99.8% of people use fluoridated public water, followed by Kentucky (99.4%), Minnesota (98.8%), North Dakota (96.4%), Illinois (95.4%), and Indiana (94.5%) (The District of Columbia, appropriately enough, is 100 percent fluoridated.) Hawaii (at 10.8%), New Jersey (13.6%), Oregon (27.4%), and Louisiana (28.3%) are the least fluoridated states. These statistics are for 2008, the most recent ones available on fluoridation. That year, in Louisiana, the legislature approved and the governor signed into law an Act that requires all community water systems in Louisiana having 5,000 or more customers (some 110 systems serving 2 million) to fluoridate their water.

Promoters are pushing for mandatory statewide fluoridation in various states, New Jersey, Pennsylvania, and Massachusetts among them. In Oregon, a bill (HB2025) is pending that will mandate statewide fluoridation. It would require all municipal water systems serving 10,000 or more customers to add fluoride to their water, for 2.4 million Oregonians, 66 percent of the state's population. Legislators in California passed a state-mandated fluoridation law in 1995 that is contingent on municipalities obtaining an outside, non-state source of funds for it. State officials are putting increasing pressure on California cities, notably San Diego, that have not yet complied with the law. (In 2008, 58.8% of California's public water was fluoridated.)

Meanwhile, there is growing evidence that shows fluoride damages health. The National Research Council (NRC) report published in 2006, Fluoride in Drinking Water: A Scientific Review of EPA's Standards (available free online HERE) is the first one in the 65-year history of fluoridation that examines fluoride in an open-minded and unbiased way. Charged with carrying out a government-stipulated once-every-decade review of EPA's fluoride standards, the council's panel of reviewers examined not just epidemiologic studies but also biochemical and animal studies and clinical trials. The report cites over 1,100 references. The panel concluded that the EPA's maximum and secondary maximum contaminant level goals for fluoride, 4 ppm (4 mg/Liter) and 2 ppm (2mg/L) respectively, are "not protective of public health," particularly with regard to three things: dental fluorosis; skeletal fluorosis, which causes chronic joint pain and arthritis imitating osteoarthritis; and fractures. Among the many studies the NRC panel reviewed, for example, one showed that elderly people have a 3-times greater chance of having a hip fracture drinking water with a fluoride concentration of 4.4 ppm; and another one indicated that even a 1.5 ppm concentration, close to that used in public water, is associated with a possible doubling of hip fractures. These courageous

government-appointed NRC reviewers also concluded that “fluoride appears to have the potential to initiate or promote cancers.” The [2010] Case Against Fluoride cites several other important health studies on fluoridation done since the publication of the NRC report in 2006 that support its findings.

Concerns about these 2 and 4 mg/Liter maximum contaminant levels are relevant to people drinking and using fluoridated water at 1 mg/L. Even people who live in non-fluoridated communities consume, on average, 4 mg of fluoride a day. It is in toothpaste, fruit juices, soda pop, tea, and processed foods. People living in fluoridated areas consume twice as much fluoride, 8 mg/L a day. Fluoride is readily absorbed through the skin (bathing and wearing clothes washed with fluoridated water) and through the lungs (inhaling steam in a fluoridated shower). As a result, it turns out that two-thirds of the fluoride people take into their bodies using fluoridated community water comes from bathing and wearing clothes washed in it. Athletes and people working in hot climates who drink a lot of water and infants who are fed formula with fluoridated tap water are at particular risk for being subjected to a toxic dose of fluoride. The EPA’s maximum dose level for fluoride is 0.06 mg/Kg/day, a level that many people and infants exceed.

Four years have elapsed since the NRC recommended that the EPA carry out more studies and consider lowering its 2 mg/L and 4 mg/L fluoride maximum concentration level goals. So far nothing has been done. This agency’s response to the NRC’s unwelcome news on fluoride brings to mind an observation Winston Churchill made about such things: “Men occasionally stumble over the truth, but most pick themselves up and hurry off as if nothing had happened.”

Publication of The Case Against Fluoride: How Hazardous Waste Ended Up in Our Drinking Water and the Bad Science and Powerful Politics That Keep It There is a signal event in the 65-year story of fluoridation. The book’s authors document in a convincing fashion that fluoridation is ineffective and harmful. They address first the ethics of this medical practice and present general arguments against fluoridation. In the summary to this part of the book, they write:

“When the fluoridation of drinking water began, there was little evidence for its long-term safety, and since then little attempt has been made to monitor its health effects systematically. Because there are so many unanswered health questions, fluoridation of water must be considered an ongoing experimental procedure, and as such it is a violation of the Nuremberg Code, which forbids experimentation on humans without their informed consent. Only a minority of countries practice fluoridation. In Europe, nearly all countries either have never fluoridated their water or have ceased doing so. Yet the incidence of caries has declined just as much in those countries as in countries that practice fluoridation.”

The Case Against Fluoride next marshals evidence indicating that fluoridation is

ineffective in its intended purpose of preventing tooth decay, then it recounts the history of what the authors call “The Great Fluoridation Gamble,” followed by a section on how fluoride harms health. Four chapters are devoted to explaining, in turn, how fluoride harms the brain, the endocrine system (especially the thyroid gland), bone, and kidneys. Another one analyzes evidence that fluoride causes osteosarcoma in young boys. In the chapter on fluoride and the brain, the authors write, “There have also been twenty-three studies indicating a lowered IQ in children associated with levels as low as 1.9 ppm fluoride in drinking water.” The chapter on the endocrine system finds that fluoride causes hypothyroidism and goiter, by a variety of biochemical mechanisms, and notes that the second most widely prescribed drug in fluoridated America was levothyroxine (Synthroid), for impaired thyroid function. Fluoride poisons enzymes, particularly those in bones, which contain 99 percent of the fluoride in the body. With its enzymes poisoned by the fluoride stored there and unable make the collagen needed to keep bones healthy and strong, they become brittle and weak. The Case Against Fluoride makes a strong case that the 1 mg/Liter (1 ppm) concentration of fluoride added to community water can wreak widespread deleterious effects in multiple organ systems.

For the last 30 years the fluoride used to fluoridate community drinking water is not pharmaceutical grade sodium fluoride, or naturally occurring calcium fluoride, but untested silicofluorides – hexafluorosilicic acid and its sodium salt, sodium hexafluorosilicate. These fluoridating agents are waste products of the phosphate fertilizer industry and contain trace amounts of arsenic and lead. Fertilizer plants sell these unpurified silicofluorides to municipal water systems at a profit, rather than, at considerable expense, having to dispose of them as toxic waste.

In a court trial against fluoride, the judge presiding would stop pro-fluoridationists from making ad hominem attacks that focus on the character of the opposing witness instead of the evidence at hand; and proponents of fluoridation making repeated dogmatic assertions that fluoridation is safe and effective would be subject to cross examination. An attorney using The Case Against Fluoride as her brief in prosecuting the case against fluoridation would most likely obtain a criminal-level verdict of “beyond a reasonable doubt.”

The Case Against Fluoride also addresses, and discredits, forty claims pro-fluoridationists make for fluoride. These are some of them: Claim 1) “There is no difference in principle between chlorination and fluoridation;” 3) “Fluoride is a nutrient;” 5) “The amount of fluoride added to the public water system, 1 ppm, is so small it couldn’t possibly hurt you;” 9) “Fluoridation is needed to protect children in low-income families;” 12) “For every dollar spent on fluoridation, $38 is saved in dental costs;” 15) “Every major dental and medical authority supports fluoridation;” etc. The authors deal with Claim 17, “Fluoridation is safe and effective,” this way:

“This empty phrase is parroted so many times by pro-fluoridation officials and dentists

at meetings considering fluoridation that one begins to wonder if they receive some kind of commission every time it is uttered! Be that as it may, mechanically repeating a phrase, no matter how often, without backing it up with solid supporting evidence does not make it true."

With solid evidence now showing that fluoride placed in public water is not safe, health authorities nevertheless still continue to promote fluoridation of community drinking water. The American Medical Association (AMA) says, "The AMA recognizes the important public health benefits of drinking properly fluoridated water and encourages its member physician and medical societies to work with local and state health departments, dental societies, and concerned citizens to assure optimal fluoridation of community drinking water." The American Dental Association (ADA), in its statement on the subject, reminds us that "Studies conducted throughout the past sixty years have consistently indicated that fluoridation of community water supplies is safe and effective in preventing dental decay in both children and adults." The American Heart Association assures us that "no evidence exists that adjusting the fluoride content of public water supplies to a level of about one part per million has any harmful effect on the cardiovascular system;" and the American Cancer Society claims that "scientific studies show no connection between cancer rates in humans and adding fluoride to drinking water." But none of these accolades can top the Federal Government's Centers for Disease Control and Prevention (CDC). The CDC has proclaimed fluoridation of community drinking water one of the ten great public health achievements in the 20th century.

Starting in the 1940s with World War II, vast amounts of fluoride were needed to make atom bombs (using uranium hexafluoride to separate the fissionable uranium-235 isotope from the nonfissionable uranium-238 isotope), and emitted as toxic waste in the metal industries, especially smelting aluminum used to make airplanes. Fluoride emissions from these industries were killing crops and livestock and lawsuits loomed. Pushed partly as a matter of national security, the government painted a happy face on fluoride and convinced health policy makers and medical and dental leaders to approve putting it, well diluted, in public drinking water (for more on this part of the story see "Fluoride Follies").

How can health authorities continue to be wrong about fluoride? For 65 years? And for the last 30 years using a non-pharmaceutical-grade of fluoride taken unaltered and untested from the smokestacks of the phosphate fertilizer industry? The truth is such things are not as improbable as one might think. This is not the first time that authorities have been so wrong about the safety and effectiveness of what was considered to be a therapeutic element. Before fluoride it was mercury. Mercury was used to treat a variety of conditions ranging from cuts and scratches to syphilis. It was considered to be safe and effective. Older Americans reading this can call to mind the little reddish-brown bottle of mercury-laden mercurochrome used to treat the odd cut or scratch. But even with syphilis, bad as that disease is, treating it with mercury proved to be worse than the

disease itself. Finally recognized as the poison it is, medications containing mercury are no longer used, except, sad to say, mercury is still used in some multi-dose vaccines as a preservative. Likely what happened with mercury, however, will also happen with fluoride.

Joel Kaufmann, PhD, Professor of Chemistry Emeritus at the University of the Sciences in Philadelphia, puts the issue plainly:

Proponents of fluoridation have censored most media, ignored intelligent discussion of fluoridation, slandered most opponents of fluoridation, and overturned legal judgments against fluoridation in a manner that demonstrates their political power. Many published studies that had conclusions favoring fluoridation were later found unsupported by their raw data. (J Am Phys Surg 2005;10:38–44, available online HERE)

As Upton Sinclair notes (with additions): “It is difficult to get a man [e.g., fluoride proponents] to understand something [the fact that fluoridation of public water is neither safe nor effective] when his salary [, reputation, and power] depends on his not understanding it.”

One hopes that Americans will come to see fluoride, like mercury before it, as the poison it is and demand that municipalities stop fluoridating their water. With The Case Against Fluoride: How Hazardous Waste Ended Up in Our Drinking Water and the Bad Science and Powerful Politics That Keep It There now in public hands, along with the NRC’s Fluoride in Drinking Water: A Scientific Review of EPA’s Standards, government officials, the fertilizer industry, and misguided doctors and dentists pushing for statewide fluoridation of public water supplies will be stopped, and likely sued. The health of Americans will be substantially improved once fluoride is removed from their water.

Donald Miller (send him mail) is a cardiac surgeon and Professor of Surgery at the University of Washington School of Medicine in Seattle. He is a member of Doctors for Disaster Preparedness and writes articles on a variety of subjects for LewRockwell.com. His web site is www.donaldmiller.com

TheUnhivedMind - October 29, 2010 12:42 AM (GMT)

Fluoridated Water - The Ultimate Evil

Mark Sircus
October 28, 2010
http://www.healthtruthrevealed.com/article...1830010/article

Sodium fluoride is commonly used as a rat poison. Globalists and eugenicists have decided to add it to water supplies with the message to the public that it is good for teeth, despite warnings from the ADA stating that young children risk a disease called dental fluorosis.

Water actually is a battleground between good and evil and we see this in the fluoridation issue. One cannot understand the universe of water without grappling with poisonous fluoride and its government-mandated entry into public water supplies in the United States, Brazil, and several other countries that have stupidly followed America's lead in water fluoridation. Just because it's invisible does not make it any less deadly in the long haul in terms of public health. I had to say that because most people in fluoridated countries just don't mind that it is there; it's simply off their radar screens. And in fact, when you go back to the history and beginning of water fluoridation, we find out that it was the Nazis who used it first to turn their prisoners of war into passive sheep.

Fluoride is a poison, but that is nothing to worry about since, according to allopathic medicine, everything is poisonous and it is the dose that makes the poison. At the heart of medical science is a cankerous black hole of ugliness that leads right to the door of the American, German, and English governments (just to name the principles), along with the elite families and corporations that have come to control these governments in the last century. These controlling self-interested parties can barely be called human; they have been correctly labeled by all kinds of horrid names and have forever been a

part of and hidden by secret societies. And they have all kinds of people who have sold their souls to those who do their bidding and call it science.

Fluoride was used by Nazis to sterilize inmates and make them docile. Fluoride a key dumbing-down ingredient of Prozac and Sarin nerve gas and many other medications.

When it comes to water fluoridation we have to take off our gloves, but that is hard for most of us because we have been heavily fluoridated. And we have been exposed to, in hundreds of millions of cases, overwhelming amounts of another neurological depressant and an even more dangerous neurological poison, and that is mercury in the form of dental amalgam, vaccines containing thimerosal, as well increasing levels of environmental mercury pollution from the burning of coal and cremation of humans with mercury dental fillings still in their mouths. But of course no one has done any studies of the neurological effects of fluoride when combined with mercury exposure, which varies widely from one person to another depending on where they live and their vaccine and dental history.

“One aspect of the issue of Man’s alleged evil nature is rarely, if ever, addressed. This is the wholesale poisoning of Mankind and its affect on the brain and behavior of Mankind. Man’s food, water, and air (smog, chemtrails) are ever more poisoned. Our medicines are toxic and may be causing more harm than good, our dental fillings are called ‘silver’ yet are over half mercury; likewise our infants are forced to have vaccinations also with mercury and other toxins. The proven carcinogen fluoride is added to water and is in many medicines and toothpastes. The German Nazi regime is said to have fluoridated water because it made people docile. Is the same rationale ongoing in the USA? In a ludicrous ‘environmental’ change, incandescent bulbs are soon to be phased out and replaced with more efficient fluorescent bulbs that all have mercury within them?! All the toxins in the food, water, air, medicines, fillings, and vaccines have a terrible effect on people’s brains. Few people can truly think and change, or have the courage to act. These toxins also cause much chronic, degenerative illness, cancer, etc. The mercury in vaccines does cause autism,” writes the anonymous physicist.

Twin Toxic Dangers of Mercury and Fluoride

I have always liked all my dentists, trusting their competence more than doctors, but when I began to understand the twin dangers of fluoride and dental mercury amalgam I began to see that the entire profession has been duped, and that goes for most graduates of medical school. We first-world people like to think that our universities and medical schools are centers of higher learning and intelligence, but the fact is that they are intense conditioning machines that forcefully mind shape the brains of their vulnerable students who start out with good intentions.

Fluoride is a toxic poison that has known serious side effects.

In my book The Terror of Pediatric Medicine I write about the terror of mercury in vaccines and the incredible fact that our beloved pediatricians in white coats are actually the worst kind of terrorists because they concentrate their dark intentions on newborns and little children. I mention this because here in this chapter, before we really get into any serious science about fluoride, we also have to mention the abomination of adding fluoride to toothpaste and again exposing children to its toxic profile.

Scientific evidence over the past 50 plus years has shown that sodium fluoride shortens our life span, promotes various cancers and mental disturbances, and most importantly, makes humans stupid, docile, and subservient, all in one neat little package.

In 1993 I helped start the Medical Veritas medical journal and in one of its first issues was Dr. Paul Connett's essay,Fifty Reasons To Be Against Fluoridation. Unfortunately, and in part due to fluoridation and our increasing mercury exposure it, is hard for us humans to be effectively against anything so the horror goes on, yet people like Dr. Connett fight on. He has now published:

The Case Against Fluoride: how hazardous waste ended up in our drinking water and the bad science and powerful politics that keep it there, by Connett P, Beck J, and Micklem HS, summarizes thehistorical, political, ethical, toxicological, andepidemiological scientific data behind drinking-waterfluoridation. The book concludes that, if proposedtoday, fluoridation of drinking water to prevent toothdecay would stand virtually no chance of beingadopted, given the current status of scientificknowledge.

In the case of water fluoridation, according to the above authors, the chemicals that go into the drinking water that more than 180 million people drink each day in the United States are not even pharmaceutical grade, but rather a hazardous waste product of the phosphate fertilizer industry. It is illegal to dump this waste into the sea or local surface water, and yet it is allowed in our drinking water. To make matters worse, this program receives no oversight from the Food and Drug Administration, and the Environmental Protection Agency takes no responsibility for the practice. And from an ethical standpoint, say the authors, water fluoridation is a bad medical practice; individuals are being forced to take medication without their informed consent; there is no control over the dose and no monitoring of possible side effects.

Acute high oral exposure to fluoride may lead to nausea, vomiting, abdominal pain, diarrhea, drowsiness, headaches, polyuria

and polydipsia, coma, convulsions, cardiac arrest, and death.

Historically, fluoride was quite expensive for the world's premier chemical companies to dispose of, but in the 50s and 60s, Alcoa and the entire aluminum industry—with a vast overabundance of the toxic waste—somehow sold the FDA and our government on the insane (but highly profitable) idea of buying this poison and then injecting it into our water supply as well as into the nation's toothpastes and dental rinses. Consider also that when sodium fluoride is injected into our drinking water, its level is approximately one part-per-million (ppm), but since we only drink one-half of one percent of the total water supply, the hazardous chemical literally "goes down the drain" and voila—the chemical industry not only has a free hazardous waste disposal system, but we have also paid them with our health and our pocketbooks for the process.

The aluminum and phosphate fertilizer industries were not alone. The American government's atomic weapons program was also producing huge amounts of fluoride and was getting sued by famers for the damage done to their cattle.

In part one of The Case Against Fluoride, "The Ethical and General Arguments Against Fluoridation":The requirement for the informedconsent of the patient before administration of amedication is a basic human right. Yet with fluoride, which is added to drinkingwater as a therapeutic intervention, no such permission is sought or given. The process is enforced on every member of the population. The authors explore thisfact in the context of medical ethics. Another aspect is the efficacy of fluoridationas a therapy, which, the authors argue, is marginal at best and deleterious at worst.The fluoride used for water fluoridation is not of pharmaceutical grade, but is in fact a chemical waste byproduct. The lack of any rigorous studies as to the efficacy of fluoridation programs, the authors contend, means that the wholeprocess is experimental. There is no control of "dose"—how much fluorideanyone receives from the water.

Christopher Bryson's widely acclaimed book The Fluoride Deception includes dozens of peer-reviewed studies showing that sodium fluoride is a deadly neurotoxin that attacks the central nervous system and leads to a multitude of serious health problems. This fact has been covered up by a collusion of government and industry who have reaped financial windfalls while illegally mass medicating the public against their will.

Perhaps the most notable study was conducted by Dr. Phyllis Mullenix Ph.D., a highly respected pharmacologist and toxicologist, who, in a 1995 Forsyth Research Institute study, found that rats who had fluoride added to their diet exhibited abnormal behavioral traits.

A 2008 Scientific American reportconcluded that "Scientific attitudes toward fluoridation may be starting to shift" as new evidence emerges of the poison's link to disorders affecting teeth, bones, the brain, and the thyroid gland, as well as lowering IQ. "Today almost 60 percent of the U.S. population drinks fluoridated water, including residents of 46 of the nation's 50 largest cities," reported Scientific American's Dan Fagin, an award-wining environmental reporter and Director of New York University's Science, Health, and Environmental Reporting Program.

The Scientific American study "concluded that fluoride can subtly alter endocrine function, especially in the thyroid." "In summary, evidence of several types indicates that fluoride affects normal endocrine function or response; the effects of the fluoride-

induced changes vary in degree and kind in different individuals. Fluoride is therefore an endocrine disruptor in the broad sense of altering normal endocrine function or response, although probably not in the sense of mimicking a normal hormone. The mechanisms of action remain to be worked out and appear to include both direct and indirect mechanisms, for example, direct stimulation or inhibition of hormone secretion by interference with second messenger function, indirect stimulation or inhibition of hormone secretion by effects on things such as calcium balance, and inhibition of peripheral enzymes that are necessary for activation of the normal hormone" reports the National Research Council of the National Academies in a 2006report on page 266.

Fluoride is a thyroid poison and because so many are so heavily exposed, the need for iodine supplementation is vastly increased. There are actually four halogens: iodine, bromine, fluorine, and chlorine. All these halogens use the same receptors in the body. Therefore if a person's diet is deficient in iodine the iodine receptors in the thyroid and stomach, for example, may fill up with bromine, which is common in grains, bleached flour, sodas, nuts, and oils as well as several plant foods. Iodine is depleted by bromine, which is used as a spray on fruits and vegetables, in baked goods, as a fumigant, and in Prozac, Paxil, and many other pharmaceutical drugs. Chlorine, fluorine, and fluoride are chemically related to iodine, and compete with it, blocking iodine receptors in the thyroid gland.

Dr. David Brownstein says that fluoride inhibits the ability of the thyroid gland to concentrate iodine, and research has shown that fluoride is much more toxic to the body when there is iodine deficiency present. When iodine is supplemented, the excretion rate of the toxic halides bromide, fluoride, and perchlorate is greatly enhanced. Brownstein says that after only one dose of iodine, the excretion of fluoride increased by 78% and this is very important for those who are drinking fluoridatedwater or taking medicines with fluoride in them; bromide excretion rates increased by 50%.

Halogen Poisons

Iodine forms compounds with many elements but is less reactive than the other members of the halogens group and has some metallic light reflectance. There is a well-known law of halogen displacement: the critical activity of any one of these four halogens is in inverse proportion to its atomic weight.

The mechanism behind “halogen displacement” was probably best described by J.C. Jarvis, M.D. (Folk Medicine, Henry Holt & Co., 1958, HB, p. 136), who wrote: “The clinical activity of any one of these four halogens is in inverse proportion to its atomic weight. This means that any one of the four can displace the element with a higher atomic weight, but cannot displace an element with a lower atomic weight. For example, flourine can displace chlorine, bromine, and iodine because flourine has a lower atomic weight than the other three. Similarly, chlorine can displace bromine and iodine because they both have a higher atomic weight.” Likewise, bromine can displace iodine from the body because iodine has a higher atomic weight. A reverse order is not possible.

Fluoride and Cancer

In 2005, a study conducted at the Harvard School of Dental Health found that fluoride in tap water directly contributes to causing bone cancer in young boys.“New American research suggests that boys exposed to fluoride between the ages of five and 10 will suffer an increased rate of osteosarcoma—bone cancer—between the ages of 10 and 19,” according to a London Observer article about the study.

Based on the findings of the study, the respected Environmental Working Group lobbied to have fluoride in tap water be added to the U.S. government’s classified list of substances known or anticipated to cause cancer in humans. Cancer rates in the U.S. have skyrocketed with one in three people now contracting the disease at some stage in their life.

The link to bone cancer has also been discovered by other scientists, but a controversy

ensued after it emerged that Harvard Professor Chester Douglass, who downplayed the connection in his final report, was in fact editor-in-chief ofThe Colgate Oral Health Report, a quarterly newsletter funded by Colgate-Palmolive Co., which makes fluoridated toothpaste.

An August 2006 Chinese study found that fluoride in drinking water damages children's liver and kidney functions.

Disease in rural China linked to polluted coal

WASHINGTON, D.C., (Oct. 19, 2010) -- In remote, rural areas of southwestern China, villagers cook and dry their clothes by burning pieces of coal they pick up off the ground. This fuel releases a toxin that may be poisoning millions of people, according to an ongoing investigation by chemists at the University at Buffalo in New York. The researchers are presenting their work today at the AVS 57th International Symposium & Exhibition, which takes place this week at the Albuquerque Convention Center in New Mexico.

The toxin in question is fluoride, which binds to calcium in the human body and causes the disease fluorosis. This condition, which affects millions in China's Guizhou province, can cause dental problems, such as discolored and pitted teeth, as well as joint pain, muscular degeneration, and deformities in joints and the spine.

Worldwide, the most common source of excess fluoride is polluted water. But according to Joseph Gardella, a chemist at UB who has collaborated on a research project with Professor Handong Liang of the China University of Mining and Technology, Beijing (CUMTB), polluted coal may also be to blame.

"Careful research supported by the Chinese government eliminated water as the source, and pointed to air pollution from coal fired home fireplace," says Gardella. "The government has focused on finding solutions to the health issues resulting from the pollution in the villages and in identifying solutions to eliminating the pollution sources."

Gardella and graduate student Brett Yatzor analyzed samples of the coal gathered by the villagers using a variety of imaging techniques -- including Time-of-Flight Secondary Ion Mass Spectrometry, which reveals not only the composition of a sample but also its chemical structure.

"When you just look at coal, it looks pretty homogenous," says Yatzor. "But when you do a chemical ion image, you can see that it's very heterogeneous."

Yatzor's imaging showed that -- like purer coals burned by power plants -- the carbon in the coal itself contained little fluorine. However, the inorganic clay used as an additive for coal-burning and as a binder in briquette-making by local residents showed very high levels of fluorine.

The scientists are still investigating exactly how this fluorine enters the human body. It might be inhaled in the particles produced when coal is burned in the villagers' closed, ventless huts. It could also be ingested; preliminary analyses of food samples such as chilies and corn have shown high levels of the toxin.

As the scientists' work continues, the Chinese government has put in place programs to install chimneys that would improve the ventilation of smoke in the huts and allow particulates to escape.

###

The presentation, "Imaging of Coal Speciation Using TOF-SIMS and Scanning Transmission X-Ray Microscopy (STXM) " is at 4:00 p.m. on Tuesday, October 19, 2010.

MORE INFORMATION FOR JOURNALISTS

The AVS 57th International Symposium and Exhibition is being held October 17-22, 2010, at the Albuquerque Convention Center, in Albuquerque, New Mexico. The meeting includes more than 1,200 talks and posters presented in more than 130 technical sessions. All meeting information, including directions to the Convention Center, can be found at: http://www2.avs.org/symposium/

REGISTRATION -- Staff reporters and professional freelance journalists working on assignment are invited to attend the conference free of charge. Journalist registration instructions can be found at: http://www2.avs.org/symposium/AVS57/pdfs/pressinvite.pdf

PRESS ROOM

The AVS press room will be located in East Lobby of the Albuquerque Convention Center. Press room hours are Monday-Thursday, 8:00 a.m. to 5:00 p.m. The phone number there is 408-205-0595. Press Kits containing company product announcements and other news will be available on CD-ROM in the press room. Also access the online press room at: http://www2.avs.org/symposium/AVS57/pages/press57.html

USEFUL LINKS

Complete Program: http://www2.avs.org/symposium/AVS57/pages/tech_program.html
Searchable abstracts: http://www.avssymposium.org/Open/SearchPapers.aspx
Topical Conferences: http://www2.avs.org/symposium/AVS57/pages/...topconf.html#EN
Meeting Home Page: http://www2.avs.org/symposium/

PLENARY SESSION

The plenary talk, "Carbon Nanotubes and Single Sheet Graphene," which will be at noon on Monday, October 18, 2010 in Ballroom B of the Albuquerque Convention Center. See: http://www2.avs.org/symposium/AVS57/pages/...s_lecturer.html

SPECIAL TUTORIALS

AVS promotes communication, dissemination of knowledge, recommended practices, research, and education in a broad range of technologically relevant topics. One way that it does this is by offering special tutorials in areas such as:

- Graphene Tutorial (Sunday, October 17, 2010, 1:00-5:00 p.m.)

- Tutorial on Nanoparticle Characterization and Toxicity: Significant Challenges and Critical Needs (Sunday, October 17, 2010, 1:00-5:00 p.m.)

To access the complete descriptions of these special tutorials, see: http://www2.avs.org/symposium/AVS57/pages/..._tutorials.html

ABOUT AVS

As a professional membership organization, AVS fosters networking within the materials, processing, and interfaces community at various local, national or international meetings and exhibits throughout the year. AVS publishes four journals, honors and recognizes members through its prestigious awards program, offers training and other technical resources, as well as career services.

News Video Footage Shows Fluoride Toxicity & "Target" Organs

Workers at a US water treatment plant were amazed and disgusted at what they were expected to mix in to the domestic tap water supply in their region. So much so they refused to add it and released footage of it.

Title: Death by Fluoride

craig-oxley - September 19, 2010 03:44 PM (GMT)

Death by Fluoride

Monday, Nov. 30, 1942
http://www.time.com/time/magazine/article/...66637%2C00.html

Assistant Cook A. M. McKillop was short-handed and in a tearing hurry. His supper menu at the Oregon State Hospital for the Insane, in Salem, called for scrambled eggs. He needed powdered milk to make them. Against the rules he dispatched a kitchen-helper inmate to the catacomb-like cellar to bring him a new supply.

The eggs were served. At long tables in one dining ward, 467 mental patients clinked their forks and spoons against their tin and enamelware plates. Minutes later they began to drop in anguish to the floor. That night and the next day 47 of them died. In the tiny morgue the bodies had to be piled like cordwood.

For three days State police quizzed terrified employes and bewildered patients.

At last the truth came out. The kitchen helper seeking the powdered milk had dim-wittedly come back from the wrong storeroom with seven pounds of sodium fluoride roach powder, with which hurried, overworked Cook McKillop had scrambled the eggs. At week's end McKillop and his boss, Mary O'Hare, were booked on charges of involuntary manslaughter.

The hydrangea hedges, the big round beds of pansies, a fountain tinkling outside the main entrance of the institution "out at the end of Center Street," where Oregon houses 3,000 of its mental patients, make its externals pleasing to the eye. But any Oregonian who knows enough to make comparisons is shocked by the interior of this mid-Victorian (1883) Bedlam. Its 3,000 patients are 1,000 more than facilities properly can care for. Two toilets, seatless and of vintage unknown, must serve 60 men; 62 women share one metal wash basin.

Thanks to conscientious Dr. John C. Evans, superintendent, the institution is clean. But thanks to Oregon's legislature and public neglect, the State spends scarcely more than half as much money per month per patient as neighboring California, leaves its institution's superintendent to cope as best he may with too many patients, too small a staff. At a cost of 47 deaths, Oregon may learn to take better care of her insane.

Why Fluoride Should Be Banned From Our Drinking Water

by Doug DiPasquale Sep 13th 2010 9:00AM
http://www.thatsfit.ca/2010/09/13/fluoride...nk1|170350

I woke up to some good news today, when I saw the headline "Green Party of Canada calls for ban on the fluoridation chemicals hexafluorosilicic acid and sodium silicofluoride." It seems that, like me, the Green Party isn't happy with the fact that we indiscriminately pump fluoride into our water supply and wants it banned at the federal level. Go Green Party!

Fluoride has been added to our water supply for the last 60 years, supposedly for the benefit of our teeth. It is widely believed that adding fluoride to the drinking water will help to prevent dental caries (cavities). However, the 1999 Centers For Disease Control study widely cited as justification for the fluoridation of the water supply only looked at topical applications of fluoride in the form of toothpastes and dental fluoride treatments, not ingested fluoride.

The Green Party's reasons for banning fluoride in tap water are mainly environmental, citing the fact that the fluoride chemicals put into our drinking water are actually toxic by-products scrubbed from the smokestacks of the phosphate mining industry. Also, 99% of this fluoridated water ends up being discharged back into the environment, because none of the processes used to treat sewage water can remove fluoride.

The environmental impact is extremely important, for sure, but I come at the issue from the perspective of how fluoridation immediately affects our health. In 2006, a distinguished panel appointed by the National Research Council of the National Academies published a 500 page report about the effects of excessive fluoride ingestion. Their conclusion was that the standard set by the U.S. Environmental

Protection Agency (EPA) of 0.4 parts per million is unsafe and causing "increased risk of bone fractures, decreased thyroid function, lowered IQ, arthritic-like conditions, dental fluorosis and, possibly, osteosarcoma." Toronto, as an example, currently fortifies their water to 0.6 ppm.

Ethically speaking, even if fluoridation of the water supply worked the way we're told it does (preventing tooth decay), we're being delivered unregulated, unapproved medication via the water supply without our consent. This is completely unethical. Never mind that the daily dose of medications delivered in this way can't be regulated and the effects of fluoridation on the population are not being monitored -- even more importantly, our rights are being infringed upon by our inability to opt out. Fluoride is actually quite difficult to remove from water, requiring expensive reverse osmosis filter systems or distillation. Yet the cost of these systems is not subsidized for those who don't wish to ingest excessive fluoride.

Lets face it, the fluoridation of our water supply has always been a sneaky means for industry to get rid of a toxic by-product. It has never been about the health of the public's teeth. Keep in mind that the effectiveness of fluoride in drinking water for preventing cavities has *never* been demonstrated, it has only been assumed effective given the effectiveness of topical fluoride treatments. Fluoride works to reduce tooth decay from the exterior of the tooth, not systemically from inside the body. It simply makes no sense to drink it. Fluoride toothpastes are cheap and widely available. This is a viable strategy for getting fluoride for dental health, if one chooses, not by exposing the rest of the body to the risks involved in fluoride ingestion.

Ironically, epidemiological evidence largely indicates water fluoridation to be detrimental to the health of the teeth. Excess fluoride in the diet can actually lead to a condition known as dental fluorosis, where brown discolouration of the teeth with white spotting occurs. A 2007 report by the CDC stated that 41 percent of children aged 12-15 now have some form of fluorosis, whereas 36 percent of children 16-19 have fluorosis. While this effect is largely cosmetic, it still brings the wisdom of fluoride supplementation into question.

Fluoride isn't even an essential nutrient, according to the National Academy of Sciences, meaning no human disease, including tooth decay, can ever result from a fluoride deficiency. The human body needs no fluoride in order to function at its optimum. The same cannot be said for true nutrients like calcium or magnesium, for instance.

Take a look at the ample information on the Fluoride Action Network's site to see the multiple, well-reasoned arguments against water fluoridation. We've been scammed on this from the very beginning. Hopefully the Green Party can make water fluoridation in Canada a thing of the past.

Broke Towns Can't Afford to Drug Constituents with Fluoride

Chris
Sep 16 2010, 1:08 PM
www.informationliberation.com/?id=32163

Who said the recession is all bad? On the bright side, it's forcing some towns to stop adding fluoride to their water supplies. A small town in Alabama has decided to stop fluoridating their water due to economic reasons, they say it will save them 50k a year.
"I guess we wound up saving about 50-thousand dollars a year in the production of our water, and we're a small system so 50-thousand dollars a year is a big savings," said Joe Beasley, Red Bay Water and Gas Department.
Apparently, they actually looked at the science, so perhaps they felt the recession was as good an excuse as ever to stop force drugging everyone.
"They had officials look at several studies and never found any evidence that supported keeping the fluoride in the water."
The Montgomery Advertiser reports 18 other water systems in Alabama have also put their forced drugging program on hold.
Goode said that unlike some states that mandate by legislation that public water systems add fluoride to their water, Alabama does not.

"Water systems may decide to discontinue fluoridating, which is a concern for the department and the communities."
Yes, what a terrible tragedy that the government doesn't mandate by law people's own tax money be used to forcibly drug their water supplies.
He told the members of the committee that the state might be "losing the battle on fluoridation."

Williamson said that the economy might be causing some systems to decide that it is too costly to maintain the equipment that provides the fluoride, or they have done away with the service all together.

"That's a problem," he said.
A problem for the state, yes. A problem for the people, no.

There is absolutely no evidence fluoride helps anyone, in fact, the opposite is true. To quote from an excellent exposé:
The history of forcing fluoride on humans through the fluoridation of drinking water is wrought with lies, greed and deception. Governments that add fluoride to drinking water supplies insist that it is safe, beneficial and necessary, however, scientific evidence shows that fluoride is not safe to ingest and areas that fluoridate their drinking water supplies have higher rates of cavities, cancer, dental fluorosis, osteoporosis and other health problems. Because of the push from the aluminum industry, pharmaceutical companies and weapons manufacturers, fluoride continues to be added to water supplies all over North America and due to recent legal actions against water companies that fluoridate drinking water supplies, precedent has been set that will make it impossible for suits to be filed against water suppliers that fluoridate. There is a growing resistance against adding toxic fluoride to our water supplies, but unfortunately, because fluoride has become "the lifeblood of the modern industrial economy"(Bryson 2004), there is too much money at stake for those who endorse water fluoridation . The lies of the benefits of water fluoridation will continue to be fed to the public, not to encourage health benefits to a large number of people, but to profit the military-industrial complex. - The Fluoride Conspiracy
Here is an excellent documentary on the history of water fluoridation for those who want to learn more:

[dohtml]<object width="640" height="385"><param name="movie" value="http://www.youtube.com/v/YPynwi_T8DQ&color1=0xb1b1b1&color2=0xd0d0d0&hl=en_US&feature=player_embedded&fs=1"></param><param name="allowFullScreen" value="true"></param><param name="allowScriptAccess" value="always"></param><embed src="http://www.youtube.com/v/YPynwi_T8DQ&color1=0xb1b1b1&color2=0xd0d0d0&hl=en_US&feature=player_embedded&fs=1" type="application/x-shockwave-flash" allowfullscreen="true" allowScriptAccess="always" width="640" height="385"></embed></object>[/dohtml]
Film Description

A chronicle of the abuse of power and of the manufacture of state sponsored medical propaganda, The Fluoride Deception reveals how military and industry scientists and public health officials buried information about fluoride's potential for harm, while promoting its use in dentistry.

The book reveals that fluoride pollution was the greatest legal threat facing the Manhattan Project and how a group of powerful Cold War industries, who all faced extensive litigation for fluoride pollution, collaborated with officials from the National Institutes of Dental Research, laundering fluoride's public image.

We'll sit with the famous doctor who reported in the 1950's that fluoride was a systemic poison, with tens of thousands of citizens uniquely sensitive to even tiny doses. We'll walk the cobbled streets of Donora, Pennsylvania, in the aftermath of the nation's most notorious air pollution disaster in 1948, and meet the scientist who blamed fluoride for the deaths. And, when a superstar toxicologist is fired in 1995, after discovering that fluoride affects the central nervous system, we'll uncover a stunning connection to the WWII atomic bomb program. Today that scientist joins a growing number of health experts who call fluoride a venomous and hydra-headed poison. They suspect its involvement in a host of modern illnesses, including arthritis,

bone cancer, and emphysema, and a spectrum of central nervous system disorders such as Alzheimer's disease and attention deficit disorder.

craig-oxley - September 4, 2010 05:51 PM (GMT)

Green Party of Canada calls for ban on the fluoridation chemicals hexafluorosilicic acid and sodium silicofluoride.

Green Party of Canada website
August 22, 2010
http://www2.fluoridealert.org/Alert/Canada...-silicofluoride

Green Party of Canada calls for ban on the fluoridation chemicals hexafluorosilicic acid and sodium silicofluoride.

(See original resolution)

At its Convention in Toronto, August 20-22, 2010, the Green Party of Canada passed the following resolution -see printer-friendly version . Also available in French . Note: In the U.S. over 90% of fluoridation of drinking water schemes use hexafluorosilicic acid and sodium silicofluoride.

Considerations:

This motion, in calling for a ban on the fluoridation of public drinking water, would create a new policy and would involve the federal government stepping into an area that has traditionally been within the jurisdiction of the provinces.

Motion Preamble:

WHEREAS fluoridation products such as hexafluorosilicic acid and sodium silicofluoride are toxic by-products scrubbed from the smokestacks of the phosphate mining industry, and less than one percent of treated water is actually ingested by people and the remaining 99 percent is discharged into the environment;

WHEREAS fluoride is not removed in sewage treatment and remains a toxic constituent of the effluent discharged by treatment plants to rivers and lakes, and background levels of fluoride in the Great Lakes exceed the Canadian Water Quality Guideline (CWQG) for aquatic species, and fluoride concentrations in sewage effluent are 5-10 times in excess of the CWQG. At these concentrations fluoride is known to be toxic to a variety of water species such as salmon, caddisfly, daphnia & others;

WHEREAS the use of drinking water to deliver medications is not medically or environmentally sustainable, and the use of unregulated, unapproved medications in drinking water, without a prescription or informed consent is medically and environmentally not sustainable, and the daily dose of fluoride cannot be controlled and health effects from fluoride are not monitored;

WHEREAS 97 percent of Europe does not use artificial water fluoridation products in their public drinking water supply, and 94 percent of the world's population does not use artificial water fluoridation products in their public water supply;

WHEREAS no statistical difference exists in rates of dental caries between areas that use artificial water fluoridation chemicals and those that do not (Statistics Canada);

WHEREAS the Green Party affirms that the precautionary principle should be used where there is evidence of potential harm in the absence of complete scientific consensus.
Motion Operative:
BE IT RESOLVED that the Green Party seeks to introduce and support legislation that will ban artificial fluoridation products in public drinking water.

View Full Version: 50 Reasons to Oppose Fluoridation

Title: 50 Reasons to Oppose Fluoridation

craig-oxley - September 4, 2010 12:44 AM (GMT)

50 Reasons to Oppose Fluoridation

Dr. Paul Connett
September 3, 2010

Abstract Water fluoridation is the practice of adding compounds containing fluoride to the water supply to produce a final concentration of fluoride of 1 part per million in an effort to prevent tooth decay. Trials first began in the US in 1945, but before any of these trials were complete, the practice was endorsed by the US Public.

Health Service in 1950. Since then fluoridation has been enthusiastically and universally promoted by US health officials as being a “safe and effective” for fighting tooth decay. However, even though most countries worldwide have not succumbed to America’s enthusiasm for this practice, their teeth are just as good, if not better, than those countries that have. The “50 Reasons” offered in this article for opposing fluoridation are based on a thorough review of the scientific literature as regards both the risks and benefits of being exposed to the fluoride ion. Documentation is offered which indicates that the benefits of ingested fluoride have been exaggerated, while the numerous risks have been downplayed or ignored.

Introduction

This document, titled “50 Reasons to Oppose Fluoridation,” has an interesting history. In October 2000, Dr. Hardy Limeback and I were invited by Ireland’s Ministry of Health and Children to present our concerns about water fluoridation to a panel called the “Fluoridation Forum.” We accepted. Ireland is the only country in Europe which has mandatory fluoridation and currently, over 70% of the Irish population is drinking fluoridated water.

When fluoridation opponents in Ireland heard that we had agreed to testify they were

furious. They believed that this forum had been set up by the government merely to appear to deal with growing discontent about fluoridation. Opponents believed that most of the Forum panel members had been hand picked to “whitewash” fluoridation, and by testifying, Dr. Limeback and I would give an illusion of legitimacy to an illegitimately established process and any product it produced. We were in a dilemma. Although we also suspected that the opponents were correct in thinking the Forum was merely a rubber stamp for government policy, we both had a strong desire to bring the best science available to the panel. Had we chosen not to appear, proponents could have argued that there was no valid, scientific case to be made against fluoridation. In the face of fierce opposition we proceeded to testify. In my testimony, however, I explained that many citizens felt the forum was “fixed.” Then I offered the panel a challenge that could demonstrate to the Irish people and to us that the panel was truly going to perform an objective review of the issue. I presented the “50 Reasons to Oppose Fluoridation” and asked the panel to prepare a written, scientifically documented response and to make it publicly available.
A d v e r t i s e m e n t

Initially, the panel agreed and set up a sub-committee to do this. Forum minutes over the next year indicate several exchanges about how much progress was being made with the task. However, shortly before the Forum report was completed, it was announced that the panel didn’t have time to complete its answers. The cover excuse was that most of the 50 reasons were actually addressed in their 296 page report. This was blatantly untrue. Subsequently, a group of 11 scientists, including Dr. Limeback and myself, issued a detailed critique of the Forum’s report which can be accessed at http://www.fluoridealert.org/irish.forum-critique.htm It now has been three and a half years since the “50 Reasons to Oppose Fluoridation” was presented to the Fluoridation Forum, and even though the Irish Minister of Health and Children, Mr. Michael Martin, has been questioned about this document in the Irish parliament, there still has been no formal answer to the questions. Meanwhile, citizens in other fluoridated countries (e.g. Australia, Canada, New Zealand and the United States) have asked their own local, state and federal health officials to respond to the “50 Reasons” document – also to no avail).

1) Fluoride is not an essential nutrient (NRC 1993 and IOM 1997). No disease has ever been linked to a fluoride deficiency. Humans can have perfectly good teeth without fluoride.

2) Fluoridation is not necessary. Most Western European countries are not fluoridated and have experienced the same decline in dental decay as the US (See data from World Health Organization in Appendix 1, and the time trends presented graphically at http://www.fluoridealert.org/who-dmft.htm). The reasons given by countries for not fluoridating are presented in Appendix 2.)

3) Fluoridation's role in the decline of tooth decay is in serious doubt. The largest survey ever conducted in the US (over 39,000 children from 84 communities) by the National Institute of Dental Research showed little difference in tooth decay among children in fluoridated and non-fluoridated communities (Hileman 1989). According to NIDR researchers, the study found an average difference of only 0.6 DMFS (Decayed Missing and Filled Surfaces) in the permanent teeth of children aged 5-17 residing in either fluoridated or unfluoridated areas (Brunelle and Carlos, 1990). This difference is less than one tooth surface! There are 128 tooth surfaces in a child's mouth. This result was not shown to be statistically significant. In a review commissioned by the Ontario government, Dr. David Locker concluded:

Fresh food that lasts from eFoods Direct (Ad)

"The magnitude of [fluoridation's] effect is not large in absolute terms, is often not statistically significant and may not be of clinical significance" (Locker 1999).

4) Where fluoridation has been discontinued in communities from Canada, the former East Germany, Cuba and Finland, dental decay has not increased but has actually decreased 2 (Maupome 2001; Kunzel and Fischer,1997,2000; Kunzel 2000 and Seppa 2000).

5) There have been numerous recent reports of dental crises in US cities (e.g. Boston, Cincinnati, New York City) which have been fluoridated for over 20 years. There appears to be a far greater (inverse) relationship between tooth decay and income level than with water fluoride levels.

Fluoride: Direct Engagement to Incite Public Inquiry

Travis Crank
We Are Change Wichita
September 3, 2010
http://www.facebook.com/NxTC1275

All things relative and the timing of things shouldn't go un-noticed. Some things just can't be dismissed as coincidence because not everyone was born yesterday – some were born the day before…

On August 28th, an almost overlooked article by Karen Shideler of The Wichita Eagle was caught by one of our fellow activists and forwarded to me, covering a meeting by the Visioneering Health Alliance, here in Wichita. Consisting of about a hundred members chiming in on issues such as, "…obesity and diabetes, mental health, oral health, and health disparities", near its conclusion the author quotes a number of participants seeking a renewed call for fluoridating (i.e. sedating) the

citizens of Wichita under the guise of oral health.

'Instant Recess' Among Ideas for Healthy City

~ "Participants ran out of time before they could share ideas about improving oral health, but not before the issue of fluoridation came up. It has been contentious in the past. Wichita is the only city of its size to not fluoridate its water", leaders and participants noted, and H. David Wilson, dean of the University of Kansas School of Medicine, turned to City Council member Janet Miller to ask why. "The votes to do so aren't there", she said.

This immediately follows our recent anti-fluoride posters blitz throughout the area, and subsequent reaction from our city's Water Director and other public servants.

Dr. Wilson could be among the next ones we choose to call-out out in public, among other members of the Visioneering Health Alliance and Wichita City Council – if they choose to persist.

To his credit, it's uncertain from his quote on whether or not he advocates the deliberate poisoning of our water (like so many other cities in our state already are), or simply inquiring as to why it's not being done here – with the familiar gang mentality of, "Well, if everyone else is doing it, why aren't we?"

Sheep in Human Clothing: Scientists Reveal Our Flock Mentality

A recent article on Infowars by Ryan Banister entitled, "Fluoride is a Poison" cites an as example of such flock mentality in San Jose, California, whose public-servants are making the same argument:

"The group's chief argument is that San Jose, California is one of the largest metropolitan areas in the nation to not have a fluoridated water supply. There is a false dilemma here in saying that somehow because many other metropolitan cities have fluoridated water that this is reason enough to bring it to San Jose."

Those who would deceive you will forever leverage this psychology, while manufacturing a perceived public approval for their own agenda. On an individual level, media and establishment talking-heads work to make you feel marginalized and outnumbered by an overwhelming majority, when in fact those in opposition to a given matter are the majority. True common-ground with others is found by face-to-face communication and not adhering to political correctness as defined by the very ones working to enslave us. Don't believe just anything you get from a lab-coat or otherwise official sounding figure, regardless of their indoctrination level.

No, I didn't mean to say education level…

Indoctrination vs. Education by Robert H. Sorge, N.D., Ph.D.

~ "Public consent to fluoridation is invariably manufactured by advocates with public funds. Informed consent on a community-wide level is not possible when politics masquerade as science. A campaign of indoctrination is the tool and tactic of spin-doctors, not of responsible community leaders."

Dr. Wilson's obvious malfunction hasn't gone unanswered, nor has he gone unopposed by

everyone so qualified (or more so), at the University of Kansas. An esteemed colleague of Dr. Wilson, Dr. Albert W. Burgstahler, animatedly opposes any perceived health benefit in his own work and in his comments concerning the book, The Fluoride Deception by Christopher Bryson:

“The Fluoride Deception presents a scorching indictment of how researchers and health care officials working closely with government agencies, big industry, and their attorneys have allowed themselves to surrender their responsibility for the medical well-being of their fellow citizens.”

~ Dr. Albert W. Burgstahler, former president of the International Society for Fluoride Research and Emeritus Professor of Organic Chemistry at the University of Kansas

As documented in a previous article, Wichita public servants outwardly deny the fluoridation of our water here in Wichita, their own Water Poisoning Report documents otherwise:

2008 Testing Results for: WICHITA, CITY OF

Microbiological	Result	MCL	MCLG	Typical Source
COLIFORM (TCR)	In the month of August, 1.06% of samples returned as positive	MCL: Systems that Collect 40 or More Samples per Month - No more than 5% positive monthly samples;	0	Naturally present in the environment

Regulated Contaminants	Collection Date	Highest Value	Range	Unit	MCL	MCLG	Typical Source
ARSENIC	4/30/2008	1.5	1.5	ppb	10	0	Erosion of natural deposits
ATRAZINE	5/19/2008	0.33	0.33	ppb	3	3	Runoff from herbicide used on row crops
BARIUM	4/30/2008	0.05	0.05	ppm	2	2	Erosion of natural deposits
FLUORIDE	4/30/2008	0.28	0.28	ppm	4	4	Erosion of natural deposits; water additive which promotes strong teeth

The same can be said for our neighboring cities. Witness the deception. In spite of the decline in American vocabularies, the word additive is still understood to be a deliberate action. Furthermore, ‘fluoride’ by itself continues to be used as a singular term, in order to conceal the deadly toxins under one banner for plausible deniable. Little or no mention is made of calcium fluoride, occurring naturally as the mineral fluorite. This is how the public is made to be hoodwinked.

City of Wichita Public Works/Water Director Chris Carrier states on record, “I think we’re real proud of the quality of water that we have, that water is tested several times a day.” He goes on to state that, “We don’t put any fluoride in the water at all in Wichita, we never have and we never will.” Fast-forward to 1:12…

Crashing Through the Lies and Disinformation

In reaction to my open letter to the City of Wellington, and my personal delivery of several

hundred Poison in the Tap Water posters to one of our most heavily sedated communities, Wellington's local newspaper responded with the following article on August 26th, in which their elected leaders continue to regurgitate the usual lies and pre-canned responses.

Water is Safe, Wellington 'Officials' Say…

"Shhhh, it was only a bad dream. Hush little slave, just go back to sleep…"

Take your pills, take your shots, don't ask provocative questions and just continue sucking your thumbs as you soak up that Faux News/Glenn Bunk special you take as gospel – following that aspartame-sweetened, fluoride-laced Kool-Aid to wash down your GMO TV dinner…

Not only is the City of Wellington openly fluoridating its water supply and continuing to advocate it in the name of dental health – they've been caught lying by their own admission, concerning the type of fluoridation being done and the chemical being used. In the article, City Manager Gus Collins issues his standard textbook response in stating:

"The City of Wellington has been adding sodium fluoride to the water system since 1994 and so far, nothing dangerous has been linked to the additive. The maximum contaminate level for fluoride is 4 mg/L. We have consistently tested at 2 mg/L. The addition of fluoride is standard practice for municipalities or entities that supply water to its residents. Is it absolutely necessary, no … but it's absolutely safe and we will continue to look into it…"

So, exactly who gets to decide what level of a known poison can be considered safe or therapeutic? NO ONE has the right to forcibly medicate anyone, most certainly not entire populations in the name of dental health, with the true intention being to dull the 'teeth' of the freedom movement in this nation and make its population more docile, with the added 'benefits' of reducing fertility and padded the pockets of the medical-industrial complex and big pharma.

Up is down and down is up. The words Danger, Toxic by Ingestion, Target Organs and other explicit warnings are taken to mean that it's "absolutely safe" for the human to consume in 'therapeutic levels'.

Because they simply tell you it is so. And a picture isn't worth a thousand words against those from a complicit operative, or just useful idiot for the New World Order…

City Manager Gus Collins also refers to the Kansas Department of Health and Environment's frequent testing of their water; a number of eugenics roles from this agency now being championed by former Kansas Governor Kathleen Sebelius – advocate for ObamaCare and now Health and Eugenics Services Secretary for the Barry Soetoro White House.

Hitler agreed, it has a very therapeutic effect (outside looking in). After all, it effectively served to make his prisoners more docile, less combative and reduced their overall cognitive abilities very well.

"Fluoridation is the greatest case of scientific fraud of this century." ~ Robert Carlton, Ph.D, former EPA scientist

While sodium fluoride in itself is dangerous enough (a chemical waste product of the aluminum industry and other manufacturing processes), Wellington's very own Water Poisoning Report

proves in written admission – that it's not the granular form of sodium fluoride powder that they are adding, but a more dangerous liquid poison from rock fertilizer known as hydrofluosilicic acid (see blue highlighted text):

Kansas Department of Health and Environment
Bureau of Water - Public Water Supply Section
2008 Fluoride Monitoring Results
Prepared by Dianne Sands - Environmental Technician III on March 6, 2008

Public Water Supply Name (systems that fluoridate and monitor quarterly are in bold)	Population Count	Collection Date	Fluoride Level (mg/L)
WELLINGTON, CITY OF	**7991**	**13-Oct-08**	**1.3**
WELLINGTON, CITY OF	**7991**	**23-Jul-08**	**0**
WELLINGTON, CITY OF	**7991**	**15-Apr-08**	**1.5**
WELLINGTON, CITY OF	**7991**	**15-Apr-08**	**1.4**
WELLINGTON, CITY OF	**7991**	**23-Jan-08**	**1.4**

Water Treatment
The City's Water Treatment Plant uses hydrated lime and aluminum sulfate in the treatment process. Hydrofluorosilic acid (fluoride) is added to the treated water and chlorine is used for disinfection.

Testing Results for CITY OF WELLINGTON

Microbiological	Result	MCL	MCLG	Typical Source
COLIFORM, TOTAL (TCR)	In The month of October, 1 sample returned as positive	MCL: No more than 1 Positive Monthly Sample	0	Naturally present in the environment

Regulated Contaminants	Collection Date	Highest Value	Range	Unit	MCL	MCLG	Typical Source
ARSENIC	4/15/2009	1.5	1.5	ppb	10	0	Erosion of natural deposits
ATRAZINE	5/18/2009	1.2	1.2	ppb	3	3	Runoff from herbicide used on row crops
BARIUM	4/15/2009	0.036	0.036	ppm	2	2	Discharge from metal refineries
FLUORIDE	10/14/2009	1.2	1.3-1.5	ppm	4	4	Erosion of natural deposits; Water additive which promotes strong teeth
NITRATE (AS N)	5/12/2009	4.6	4-4.6	ppm	10	10	Runoff from fertilizer use
SELENIUM	4/15/2009	4.4	4.4	ppb	50	50	Erosion of natural deposits
TURBIDITY	4/15/2009	.24	.24	NTU	1		Soil runoff

Behold the package labels for Wellington's slow, chemical lobotomy:

HYDROFLUOSILICIC ACID

AVOID CONTACT WITH SKIN, EYES, MOUTH & CLOTHING

AVOID BREATHING FUMES OR VAPOR

DANGER POISON

DO NOT TAKE INTERNALLY

WARNING

DIRECTIONS FOR WATER FLUORIDATION: Application of this product for water fluoridation is subject to approval of all interested state and local health authorities. Its use should conform to the American Water Works Association's "Statement of Recommended Policy and Procedure."

Exact dosage must not raise the total fluoride concentration in drinking water above 1.5 ppm. (U.S. Public Health Service maximum limit)

IF MATERIAL IS SPILLED OR RELEASED, NEUTRALIZE WITH LIME AND DISPOSE AS CALCIUM FLUOSILICIC WASTE

SPECIAL PROTECTION INFORMATION: RESPIRATORS APPROVED FOR FLUORINE, RUBBER GLOVES, CHEMICAL GOGGLES AND A PROTECTIVE APRON OR ACID RESISTANT CLOTHING SHOULD BE USED SPECIAL PRECAUTIONS SHOULD BE TAKEN IN HANDLING AND STORING MATERIAL: AVOID STORAGE IN GLASS CONTAINERS.

WHEN MATERIAL IS CONTACTED WITH FIRE, FLUORIDE GAS MAY BE RELEASED. OVEREXPOSURE TO MATERIAL MAY CAUSE CONSTRICTED BREATHING COUGHING, SKIN REDNESS, OR BURNING OF THE THROAT.

ANTIDOTE

SKIN: COPIOUS AMOUNTS OF WATER FOR 15 MINUTES.
INTERNAL: CONTACT PHYSICIAN
OTHER: CONSULT PHYSICIAN IN THE EVENT INGESTION HAS OCCURRED.
GIVE COPIOUS AND REPEATED AMOUNTS OF WATER OR A WEAK SOLUTION OF CALCIUM CHLORIDE

Patents on Fluoride Rat Poison & Insecticides
http://www.fluoride-history.de/p-insecticides.htm

The pervasive disinformation that implies somehow sodium fluoride is akin to a nutritional supplement is also championed by Kyle McIntosh of Erickson and Gill Dentistry in Wellington, KS.

In his open admission, he admits to sodium fluoride being a drug when he states:

“any drug like sodium fluoride can be dangerous”, and goes on to say that, “all drugs are poisonous, but at the right level they have a therapeutic effect.”

He also states:

“When I was in pharmacology class, at the very beginning and it talks about drugs, the very first thing in the chapter it says, ‘All drugs are poisonous, but at the right level they have a therapeutic effect’ – so anytime you have too much concentration of fluoride… it can be very toxic. I haven’t heard of anybody dying from it, and they have been putting fluoride in the water since the 1940s and 50s and there hasn’t been entire towns dying from fluoride or having cancers.”

So there you have it, another open admission of forced medication of the general public under the guise of oral health – a not unfamiliar theme. He goes on to say that, “People need to know the facts before they fall for myths about fluoride additives’, and that “There are more important health

issues to worry about."

Well sir, there are indeed many health issues to worry about, but how dare you downplay the significance of such an important issue as force-medicating the public? Everyone is entitled to their own opinions, but not their own facts.

While cynically laughing about a very serious matter, he goes on to state that:

"I've been drinking Wellington water for 15 years now and I'm still here, the only thing I have to worry about is my cholesterol. They worry about fluoride in the water, but do they worry about the health of the lower socio-economic population, what's their solution for that?"

Commonly, so-called professionals will emphasis the importance of other issues in mid-sentence when confronted and in an effort to deflect attention from the issue at hand – particularly when it threatens their own evil gospel or prolonged psychological investment in this fraud.

'Benefits' and Dangers of Water Fluoridation a Contentious Issue Nationwide

"A lot of dentists change their minds about fluoridation when they read about the potential harm but are then afraid to speak out against the mainstream in their profession…"

~ Hardy Limeback, head of preventive dentistry at the University of Toronto and dentist of more than 27 years.

Even before since early August when Infowars first put out the call for a national poster-campaign against fluoride, the effectiveness of boots-on-the-ground could not be denied. There's no substitute for interacting in the psychical world with your fellow man.

In illustrating how soft we have become, Alex Jones once observed just how times have changed insofar as face-to-face interact is concerned. As when we used to drive through our neighborhood streets, receiving a friendly wave by someone watering their lawn, barbecue's in the back yards, people interacting, children playing in the streets – as opposed to that warm, blue-glow of our television programming sets as seen from the corner of window shades of homes while passing by… When our children's vocabularies weren't reduced to just a few shorthand, non-words during the course of normal conversation and weren't texting each other from across a room, without even always uttering a sound…

Unplug The Signal and get to know your neighbors – warn your fellow humans. Dozens if not hundreds of posters can be placed by one person – one poster can reach hundreds.

As stated early on, the objective of this campaignis to rally public inquiry. You cannot hope to make changes in the world at large, if you're unwilling to speak the truth and work on the problems in your own backyard. One person mustn't have the single, solitary silver bullet – the more people one can awaken, the more solutions will manifest from the collective humans realizing their potential – to make a difference.

Nathan Janes of Pupaganda.com has effectively explained the reality of mass mind-control in the following video:

Unplug the Signal: The Truth Will Not Be Televised

Title: Study shows fluoride may not help teeth at all

craig-oxley - September 3, 2010 11:42 PM (GMT)

Study shows fluoride may not help teeth at all

Wednesday, September 01, 2010 by: David Gutierrez
http://www.naturalnews.com/029630_fluoride_teeth.html

Fluoridation of public water supplies offers no meaningful health benefit, according to a new study comparing cavity rates in two different Ontario provinces.

"Fluoridation is no longer effective," said Hardy Limeback, head of the University of Toronto's preventive dentistry program. Considering all the dangerous effects of fluoride consumption, in fact, he concluded that fluoridation is "more harmful than beneficial."

Fluoridation, the addition of fluoride to public water supplies, has been popular in First World countries for more than six decades, and the U.S. Centers for Disease Control classifies it as one of the greatest health breakthroughs of the 20th century. Fluoridation proponents claim that the mineral strengthens teeth, thereby cutting cavity rate by 20 to 40 percent.

Yet the practice has always been controversial, primarily due to fluoride's undisputed status as a highly reactive neurotoxin. More recent studies suggest that ingestion of fluoride can damage the thyroid gland and reduce children's IQ levels. In 2006, a study published in Cancer Causes and Control found that exposure to large amounts of fluoridated water made seven-year-old boys four times more likely to develop a rare bone cancer known as childhood osteosarcoma.

In the new study, conducted on behalf of The Globe and Mail, researchers from Statistics Canada compared the tooth decay rates in the provinces of Ontario, which has Canada's highest fluoridation rate, and Quebec, which has the lowest. Using data on more than 5,000 people, the researchers found no clinically significant difference.

Among children between the ages of six and 19, the tooth decay rate was only half a cavity higher in Quebec. The average number of cavities among children aged six to 11 was 1.76 in Quebec, compared with 1.7 in Ontario. In children aged 12 to 19, the absolute number of cavities increased but the difference did not; Ontario children averaged 2.35 cavities, compared with 2.79 in Quebec.

According to 2007 data, more than 75 percent of Ontario residents drink fluoridated water, in contrast with less than 6 percent of Quebec residents. Since the data were collected, the government of Quebec City has passed a law ending the use of fluoridation there.

Barring significant differences in rates of tooth brushing, bottled water consumption, or other relevant variables, the study suggests that the effectiveness of fluoridation has been strongly exaggerated.

All of Canada's dental associations and its national health agency, Health Canada, officially endorse water fluoridation. In response to the Globe and Mail report, Health Canada immediately sought to cast doubt on the study, pointing out that it failed to assess individual fluoride intake and correlate that with cavity rates. Nevertheless, the agency admitted that the study data were accurate.

The Canadian study is not the first to cast doubt on the effectiveness of fluoridation. Recent studies have shown that cavity rates have declined at similar rates worldwide, independent of fluoridation.

"The parallel reduction in [cavities] in countries with a lot of fluoridation and countries with not much fluoridation is quite dramatic," said Warren Bell, former head of the Canadian Association of Physicians for the Environment.

Although researchers in the 1940s believed that fluoride acted systemically in the body to strengthen teeth, more recent research suggests that it acts topically on the outside of the tooth. This means that brushing with fluoride toothpaste (which is then spit out) is both safer and more effective than drinking fluoridated water. Some scientists have therefore suggested that increased rates of tooth brushing, rather than water fluoridation, have led to improved dental health worldwide.

Other suggested causes include better overall oral hygiene (including flossing and more frequent brushing), lower sugar consumption, widespread use of antibiotics, and increased exposure to vitamin D in certain populations.

Title: Calcium Fluoride vs. Sodium Fluoride

craig-oxley - August 27, 2010 09:49 PM (GMT)

Calcium Fluoride vs. Sodium Fluoride

Dave Bertrand
Friday, August 27, 2010
http://trafficalertusa.spaces.live.com/default.aspx

Citizens across the country are quite aware of the bogus attempts to justify the toxic waste that is manually added to tap water. Calcium Fluoride is a natural occurrence and Sodium Fluoride is the toxic waste that became a big money maker during the 50's when waste deposits (Labeled dangerous by the EPA) began showing up in city water.

This deceptive practice continues today, but citizens are demanding answers from city officials.

During the Germany NAZI reign, the German scientists discovered that sodium fluoride could cause a low level form of lobotomy characteristics in their victims. The dumbing-down of the population, from birth, is a weapon used by governments in-order to make people passive and apathetic. To further that concept strategy, the American Dental Association promotes low dosage for better teeth, but yet a danger label on toothpaste warns of death. One toothbrush length of toothpaste can kill a child, and it's not the paste substance that may poison them, but the sodium fluoride.

Rat poison is a by product of sodium fluoride, and it is used to kill roaches, crickets, water bugs and silverfish.

This forced medication of our children has lasting affects that may be connected to the lower I.Q.'s and the recent concern by parents as to why their kids are showing on-going behavioral problems, which are now masked by psychotropic drugs. Continued use of drinking tap water with fluoride and the use of fluoride tainted toothpaste is evident of fluoridation of teeth, which many teens are showing signs of white/pearl

discoloration differences. AS far as I have seen, there is no proof that low amounts of sodium fluoride has prevented decay. (Sodium vs. Calcium) Kids still show-up everyday at the dentist office with cavities, and the “baby boomers” are having to replace all their teeth with nice white teeth, both…a booming business for dentist. Did those fluoride cleanings help? I doubt it and the proof is out there.

The concept that tap water is naturally fluoridated is not the problem. Calcium fluoride (erosion of natural deposits) is not considered a toxic waste by the EPA.

Having A Supply Of Healthy Foods That Last Just Makes Sense (AD)

Sodium fluoride is added to drinking water (in addition to calcium fluoride) for a specific purpose that started in the early 50’s. It is both financially motivated and strategically used as a weapon on the masses. How some of us survived and are speaking-out is beyond me, but like most things….some people are affected more than others.

One example…look at those that voted for Obama! They’re the same ones that will tell you that sodium fluoride (toxic waste) is good for you, or that SUV’s and cow flatulence is causing global warming! Their comrades believe that! The latest slogan by these out-of-touch individuals concerning the use of sodium fluoride is now…”It won’t hurt you in small amounts.” Neither will alcohol, but would you approve tainting the water with Jack Daniels? Don’t answer that !!

Read what is happening with the fluoride debate in Wichita. Notice the water report showing the deception of not specifying the type of fluoride being manually added to those unsuspecting citizens. The S.O.B.’s in city government, water departments that allow fluoride to be dumped in your water, should be hanged (after a fair hearing of course).

Remember, they know not what they do, because they consume their own toxic waste. China is now shipping their sodium fluoride waste to the United States (at premium prices), packets that are not marked, “A waste product of China.”

The dude that stood in front of that tank in Tiananmen Square, was not drinking the fluoride, or he was fluoridated, like a deer that stops in the middle of the road, staring at your headlights. Which are you?

City receives citation for not fluoridating water

Published on 08-23-2010 Email To Friend Print Version
http://www.register-pajaronian.com/v2_news...id=9337&page=72

The City of Watsonville has been cited by the California Department of Public Health for failure to comply with an order by the state to fluoridate the water supply.

The citation was received by the city Thursday and demands written assurance from the city by Aug. 29 that it will comply, and plan and schedule for fluoridation submitted by Sept. 19.

City Attorney Al Smith said the citation appeared “out of the clear blue.”

“We have been in communication with the Department of Health Services,” he said. “I was surprised ... but it is what it is.”

Fluoridation has been an issue ever since the City Council first passed a resolution accepting a grant to fluoridate. In February 2002, Flouridation 2010 Workgroup offered the city $946,000 to fluoridate, but in November of that year, Watsonville residents concerned about the safety of fluoridation passed Measure S, banning all substances from the water not specifically approved by the Food and Drug Administration, which includes fluoride.

But a state law requires cities to fluoridate if given the funding to do so, and Watsonville lost its battle in court to honor the voters’ wishes. However, that case was decided years ago, and the city and the California Dental Association Foundation have been wrangling over a contract ever since as the city tries to make certain the project will cost it nothing. Of specific concern are lawsuits associated with the project.

Title: Fluoride varnish to be painted on to children's
Description: *teeth [KEEP OUT OF THE DENTIST OF DEATH]*

craig-oxley - August 24, 2010 04:02 PM (GMT)

Fluoride varnish to be painted on to children's teeth

Children in the trial will have fluoride varnish painted onto their teeth

23 August 2010 Last updated at 18:16
http://www.bbc.co.uk/news/uk-scotland-edin...t-fife-11061950

Children taking part in a new health initiative in the Lothians will have their milk teeth painted with fluoride varnish in a bid to stop decay.

About 150 dentists have signed up to the Childsmile scheme to improve the oral health of the under fives.

The youngsters will have the varnish applied every six months and be monitored during regular check-ups.

Edinburgh dentist Ian Fenny said he backed the move to provide preventative treatment to stop teeth decay.

He added: "Bringing Childsmile into general dental practice is an important link in ensuring every child in Lothian from birth to school is not allowed to fall through the net of not being provided with any form of dental health education or preventative treatment.

"It will hopefully remove preconceived views that many parents have of dentists' surgeries; fears that are often relayed to the child."

The scheme forms a key part in a plan to protect the teeth of Lothian children from the time they are born until they leave primary school.

NHS Lothian's Robert Naysmith said: "Child dental health has been a problem for years

- and sadly we are still doing general anaesthetic on children who are too young to go to school to remove decayed teeth.

"Encouraging the parents of very young children to register them with a dentist will bridge the gap between birth and nursery."

From Bulldozed Towers to Scientific Manifestos
The Growing Movement Against Electromagnetic Contamination

By CHELLIS GLENDINNING

A global movement challenging the increasing presence of electromagnetic (EMF)/ radiofrequency (RF) radioactive contamination via “smart” gadgets and meters, antennas, Wi-Fi, and WiMAX is indeed afoot. Yet it resides in the shadows of popular awareness because the public communication media -- who might, but do not report on the effort -- are largely owned by the same corporate entities perpetrating the contaminating technologies, and they are motivated to not reveal the health and ecological dangers of wireless technologies. And so welcome to an unheralded, but vastly important, movement that is growing every day:

2000.

* An international gathering of scientists issues the Salzburg Resolution -- proclaiming that no low-end threshold for safe exposure exists for electromagnetic and radio-frequency radiation.

2001.

* In Cyprus demonstrators pour into the streets and fight police to protest Britain’s planned military communications towers and demand the release of their prime minister -- in jail for doing civil disobedience atop a 160-foot mast.

2002.

* Thousands of medical doctors and healthcare practitioners sign the Freiberg Appeal -- calling for tougher guidelines for EMF/RF exposure.

2003.

* After witnessing the biggest-ever protest meeting of a village in northern New Mexico, the local school board cancels an already-signed contract to erect cell towers on its schools.

* The Catholic Church in Italy calls for cell phone antennas to be removed from bell towers, branding them dangerous to human health and spiritually “out of keeping.”

* In England and Ireland outraged citizens bulldoze down cell towers –- as many as four in England and four in Northern Ireland each week.

2004.

* The International Association of Firefighters calls for a moratorium on citing cell-phone antennas on fire stations.

2006.

* Citing health concerns, Ontario University in Canada bans Wi-Fi from campus.

* The International Commission for Electromagnetic Safety releases the Benevento Resolution. Signed by 31 scientists, it calls on governments to impose stricter exposure limits.

2007.

* A BBC Panorama investigation finds that Wi-Fi ports can emit three times the signal radiation of a cell tower.

* In Spain citizens hold International Day Against Electromagnetic Pollution to publicize the effects of exposure to high-voltage power lines, electric power substations, mobile telephony aerials, radio lines, and telecommunications systems like Wi-Fi and WiMAX.

* Germany’s Environmental Ministry issues an unprecedented national warning to citizens: avoid exposure to EMF/RF emanating from Wi-Fi and WiMAX ports in cafés, schools, public “hot spots, and private homes.”

* The European Environmental Agency demands immediate action to reduce exposure to radiation from mobile phones, Wi-Fi, WiMAX, and antennas.

* When cancers are shown to increase around antennas, angry protestors in an Israeli village rip down a mobile phone mast.

* After only five months of the newly installed Wi-Fi system in Paris' libraries, the union wins a moratorium on wireless ports due to health effects evident among clerks and workers.

* A group of researchers produces the BioInitiative Report, documenting 2000 studies showing health effects of low-frequency EMF and calling for biologically-based exposure limits.

2008.

* For fear of exposure, thousands of Chinese demonstrators take to the streets to protest the extension of a radiation-emitting magnetic-levitation train through Shanghai.

* Cell phone antennas in Tudela, Spain, are ordered removed when damage to citizens' health is revealed.

* After learning of health impacts, the Sebastopol City Council in California breaks an already-signed contract to install citywide Wi-Fi.

* The National Library of France dismantles its entire Wi-Fi system.

* The West Linn-Wilsonville School Board of Portland, Oregon, unplugs already-operating cell towers and cancels all leases for WiMAX.

* The International Commission for Electromagnetic Safety issues the Venice Resolution -- claiming that current standards for citizen protection are inadequate; recognizing a growing incidence of electro-hypersensitivity; and urging limits on further dissemination of wireless technologies. The document is signed by scientists from Italy, Germany, Poland, Sweden, Turkey, Brazil, Austria, Australia, Russia, and the U.S.

2009.

* Scientists and medical doctors sign the Porto Alegre Resolution -- expressing concern that ongoing exposure to electromagnetic fields may increase the risk of cancer and chronic diseases; that exposure levels established by international agencies are obsolete; and that wireless technologies are threatening the health of children, teens, and pregnant women.

* The U.S. National Safety Council calls for a nationwide ban on cell-phone use while driving, citing a Harvard study that links use to 636,000 crashes and 2,600 deaths each year.

* In France the Versailles Court of Appeals orders the dismantling of a relay antenna, establishing legal recognition of health risks.

* The European Parliament proposes publicly displayed maps warning of EMF-exposure areas and distance requirements between antennas and schools.

* The U.K.'s Association of Teachers and Lecturers calls for suspension of Wi-Fi in classrooms.

* Portland, Oregon, challenges the U.S. Telecommunications Act's refusal to consider health effects in the placement of wireless routers and base stations. The Los Angeles Unified School District -- then the L.A. County Board of Supervisors; then Pima County, Arizona; Sebastopol and Glendale, California, do the same.

* The government of the state of Rajasthan bans the installation of new mobile towers. 2010.

* Arlington, Texas, sues the U.S. Federal Communications Commission to disband fast-tracking of cell towers.

* San Francisco, California, passes a resolution to challenge the Telecommunications Act of 1996 that forbids health concerns as a factor in placement of wireless facilities.

2011.

* The Russian National Committee on Non-Ionizing Radiation Protection releases a resolution calling for greater concern for the health effects of mobile telephones.

* The Parliamentary Assembly Council of Europe releases Resolution 1815 on the dangers of electromagnetic fields on the environment.

* The World Health Organizationand the International Agency for Research on Cancer reclassify EMF/RF fields as a Class 2B Carcinogen.

* Public outrage against "smart" meters takes the form of consumer opt-out campaigns, calls for moratoriums, lawsuits against states, and legislative appeals for hearings on health effects. In Bolinas, California, citizens physically chase utility workers out of town, and in Rohnert Park a grandmother is arrested for blocking a truck carrying the devices.

View Full Version: WHO: CELL PHONE USE CAN INCREASE POSSIBLE CANCER

Title: WHO: CELL PHONE USE CAN INCREASE POSSIBLE CANCER
Description: *RISK*

TheUnhivedMind - May 31, 2011 06:01 PM (GMT)

WHO: Cell phone use can increase possible cancer risk

By Danielle Dellorto, CNN
May 31, 2011
http://edition.cnn.com/2011/HEALTH/05/31/w....html?hpt=hp_t2

(CNN) -- Radiation from cell phones can possibly cause cancer, according to the World Health Organization. The agency now lists mobile phone use in the same "carcinogenic hazard" category as lead, engine exhaust and chloroform.

Before its announcement Tuesday, WHO had assured consumers that no adverse health effects had been established.

A team of 31 scientists from 14 countries, including the United States, made the decision after reviewing peer-reviewed studies on cell phone safety. The team found enough evidence to categorize personal exposure as "possibly carcinogenic to humans."

What that means is that right now there haven't been enough long-term studies conducted to make a clear conclusion if radiation from cell phones are safe, but there is enough data showing a possible connection that consumers should be alerted.

Cancer

"The biggest problem we have is that we know most environmental factors take several decades of exposure before we really see the consequences," said Dr. Keith Black, chairman of neurology at Cedars-Sinai Medical Center in Los Angeles.

The type of radiation coming out of a cell phone is called non-ionizing. It is not like an X-ray, but more like a very low-powered microwave oven.

"What microwave radiation does in most simplistic terms is similar to what happens to food in microwaves, essentially cooking the brain. So in addition to leading to a development of cancer and tumors, there could be a whole host of other effects like cognitive memory function, since the memory temporal lobes are where we hold our cell phones."

The voices urging caution to consumers have gotten louder in recent years.

The European Environmental Agency has pushed for more studies, saying cell phones could be as big a public health risk as smoking, asbestos and leaded gasoline. The head of a prominent cancer-research institute at the University of Pittsburgh sent a memo to all employees urging them to limit cell phone use because of a possible risk of cancer.

"When you look at cancer development -- particularly brain cancer -- it takes a long time to develop. I think it is a good idea to give the public some sort of warning that long-term exposure to radiation from your cell phone could possibly cause cancer," said Dr. Henry Lai, research professor in bioengineering at University of Washington who has studied radiation for over 30 years.

Results from the largest international study on cell phones and cancer was released in 2010. It showed participants in the study who used a cell phones for 10 years or more had doubled the rate of brain glioma, a type of tumor. To date, there have been no long-term studies on the effects of cell phone usage among children.

"Childrens' skulls and scalps are thinner. So the radiation can penetrate deeper into the brain of children and young adults. Their cells are dividing faster rate, so the impact of radiation can be much larger." said Black of Cedars-Sinai Medical Center.

Manufacturers of many popular cell phones already warn consumers to keep their device away from their body.

The Apple iPhone 4 safety manual says for users' radiation exposure to not exceed FCC guidelines, "When using iPhone near your body for voice calls or for wireless data transmission over a cellular network, keep iPhone at least 15 mm (5/8 inch) away from

the body."

Blackberry Bold advises users to, "keep the BlackBerry device at least 0.98 in. (25 mm) from your body when the BlackBerry device is transmitting."

TheUnhivedMind - July 2, 2011 06:04 PM (GMT)

Lame damage control starts once again to create confusion. Notice they say 'unlikely' this is not a straight answer folks and allows them a get out when it becomes blatantly obvious that these things are killing people.

QUOTE

Mobile phones 'unlikely' to cause cancer

By James Gallagher
2 July 2011 Last updated at 03:34
http://www.bbc.co.uk/news/health-13988882

Mounting evidence suggests there is no link between mobile phones and brain cancer, according to a review by the Institute of Cancer Research.

It stated that despite near universal mobile phone use, there had been no jump in the number of tumours.

Its report, in Environmental Health Perspectives, also identified flaws in many studies investigating a link.

A few weeks ago the World Health Organization said mobiles were "possibly carcinogenic".

The decision by the WHO's International Agency for Research on Cancer (IARC) put mobile phones in the same category as coffee, in which a link could not be ruled out, but it could not be proved either.
Heavy users

One of the biggest studies into a link was Interphone, a comparison of 2,708 patients with a brain tumour (glioma) with a similar number of people without.

The study concluded that mobile phone users were less likely to get brain tumours, but heavy users had an increased risk.

Professor Anthony Swerdlow, from the Institute of Cancer Research, said there was a risk of bias when patients with brain tumours answered questionnaires about their phone use.

Ten patients in the study said they were on the phone for more than 12 hours per day.

He added that in the space of 20 years, mobile phone use had gone from being rare to 4.6 billion users worldwide.

Yet evidence from many Western countries showed "no indication of increases in brain tumour incidence".

Professor Swerdlow said: "The trend in the accumulating evidence is increasingly against the hypothesis that mobile phone use can cause brain tumours in adults."
Childhood exposure

The report admits that there is still some uncertainty.

Studies have looked at a link associated with 10 to 15 years of mobile phone use and it remains a possibility that longer exposure could cause cancer.

However, Professor Swerdlow argues that if studies looking at longer exposure produce similar results, then a link will become "increasingly implausible".

He adds that "there is far less evidence of the effect of childhood exposure, but there is no reason to believe it causes tumours".

Cancer Research UK's Dr Joanna Owens said: "Although these researchers admit that we can't entirely rule out the idea of a link between mobile phones and brain cancer, they remind us that in most of the research, including their large international study, mobile phone users don't seem to be at increased risk.

"We don't yet have data on very long-term use of mobile phones, or for the effects on cancer risk in children, so it is probably wise to encourage children to limit their mobile phone call time."

Professor David Coggon, University of Southampton, said: "This is a carefully considered review, and the conclusions are justified.

"Mobile phones appear not to cause brain cancer in the first 10-15 years after people start using them.

"Continued research is needed in case there are harmful effects in the longer term, but the news so far is good."

View Full Version: 5 Ways Your Telecom Company is Screwing You

Title: 5 Ways Your Telecom Company is Screwing You

TheUnhivedMind - June 29, 2011 04:19 AM (GMT)

5 Ways Your Telecom Company is Screwing You

By: M. Asher Cantrell June 25, 2011 477,594 views
http://www.cracked.com/article_19268_5-way...rewing-you.html

When you look at your bill for phone, wireless and Internet service every month, you can't help but feel a sense of impotent rage. The bill is always higher than what they advertised the plan for, they cram in endless mystery charges and deep down inside you know they're screwing you. And there's really nothing you can do about it.

Well, we have good news -- it's actually worse than that! Wait, did we say "good" news? Sorry.

The point is, many of the annoying things your cellphone provider does happen behind the scenes, and you'll never find it spelled out on your bill.
#5. "4G" is a Bullshit Marketing Term

It was just a few years ago that everyone started getting 3G phones that could actually surf the Internet at speeds faster than '90s-era dial-up. But even 3G is going out of style. That's right, times are changing, grandpa! Now everyone's all about 4G. It's in pretty much every ad now, and every cellphone provider says its version is the biggest and best.

But ... notice how they're not citing actual speeds there? As in, actual megabytes per second or anything else you could actually make sense of? It's almost like they're taking advantage of the fact that the average person has no freaking idea what 4G is ("Wow, you can really feel the 'G' in this phone!").

Via Michael Saechang

Suggested slogan: "We didn't give an 'F,' so here's another 'G'!"

Well, the good news is that 4G isn't just some bullshit term they made up -- it's actually an agreed-upon standard set by a group called the International Telecommunication Union, or ITU. Then cellphone companies promptly went about utterly disregarding that and calling their much slower service "4G" anyway.

See, the 4G standard the ITU established is fast as hell -- it was supposed to be an on-the-move (i.e., riding in a train/car/bus) data rate of 100MB per second. Standing still, you should get a data rate of 1,000MBps. That's freaking 20 to 200 times faster than the average broadband connection in the U.S.

Via Wikipedia

Goddamn! Tell us where to line up!

Ah, not so fast. The "4G" plans that cellphone companies are plastering all over their ads are a fraction of that blazing-fast 4G standard. Verizon is currently capable of 32MBps maximum (though they only offer 12MBps to customers), and AT&T's is about the same (though that hasn't stopped them from trashing Verizon's identical technology). Sprint theoretically gives up to 10MBps, and T-Mobile can do up to 30MBps. Again, compare that to the between 100 and 1,000MBps we were supposed to get.

Via engadget

You can't mudsling if you're both covered in poop.

So why were these companies allowed to call that shit "4G" when it wasn't even 10 percent of the standard? Well, once they started using 4G as a marketing term, the ITU actually backed down and just said "Sure, fuck it, whatever" and retroactively applied the 4G moniker to the standards the carriers are actually using. Proving once again that if you say enough stupid shit, people will eventually give in just to shut you up.

Getty

"You're saying we at the ITU won't bend over and take it? Well you, sir, are about to get a surprise!"

So now they actually can say they're 4G and be telling the truth. It'd be like if McDonald's started making their Quarter Pounder half the size and convinced the rest of the world to change their definition of a pound.
#4. Data Rates for Texting Are Obscene

At this point, we probably text more than we talk. Americans alone send about four billion texts a day. The Pew Research Center has estimated that 72 percent of cellphone-owning adults text, usually about 10 times a day. Teenagers, because they actually have social lives, send about 50 texts a day.

And why not, it's cheap. It's like $20 a month and you can send every little thing that pops into your head to your mom, your best friend, your old third-grade teacher, your dog (you bought a phone for him just so he could read your texts) and that girl who told you never to contact her again.

Getty

"'Test results back -- it's herpes.' Annnnd send to all."

So $20 a month for a texting plan isn't bad, right? Especially when you consider that without a texting plan in place, each text costs 20 cents a pop.

Here's the thing that cellphone companies don't want you to know, though: Even the flat rate is a rip-off, because text messages cost basically nothing for them to send. Texts are kind of piggybacking on data they have to send anyway.

Getty

"Pass that to Josie, and tell Sarah on the way that she's an insufferable bitch."

When your phone is connected to a network, it operates on two different channels. One is the voice/data channel and the other is what's called the control channel. The control channel is saved for your phone saying, "Hey, I'm here!" to the tower and the tower saying "OK!" in return. It is constantly sending this traffic no matter what you do. Text messages use this channel.

Which is to say, this channel is used the same way whether a text is incoming or not. Have you ever wondered why texts are limited to 160 characters? It's because that's the maximum length of a string of data that the control channel can carry. When you send or receive a text, it's just the tower sending that instead of its usual "OK!" string. If there's no text message there, it just fills the space anyway.

Getty

The filler's nothing special, just "kill all humans" and things like that.

Even so, because texts are such tiny chunks of data, the phone companies are effectively charging you more than 7,000 percent more for a text than they do for the same amount of data downloaded as part of your regular data plan. A scientist in England found that a text costs four times as much as it would cost to send the same data from the Hubble Space Telescope.

Getty

And yet it never messages us.

It's kind of the data equivalent of bottled water. Because the total price is fairly low, you don't notice the obscene markup on what you're actually getting.
#3. Bullshit Apps You Can't Uninstall

Have you ever gotten a nice, shiny new computer, brought it home, set it all up and then found out that the manufacturer felt the need to install like five different antivirus software trials (and an AOL installer, for some reason) before it even left the factory? Now you have to uninstall all of them, otherwise they bog down your system resources and bug you to buy the full version a month later.

Now imagine it was set up so that you can't get rid of the bullshit, and it took up a good chunk of your hard drive space. That's the situation with smartphones.

Getty

It also comes packaged with an odd sense of self-satisfaction, but that's usually deflated moments later.

The first time you pull your new phone out of the box and turn it on, you might find some app you don't give a shit about. And then another. In some cases, as much as 10 percent of your phone's storage can be taken up by crap -- and by crap, we mean apps that will expire after a demo period and won't let you use them further unless you pay for the full version.

OK, you say, that's the same as what we dealt with on our PCs. But the difference is that in many cases, this stuff can't be uninstalled. It will eat up a big chunk of the

phone's resources -- forever. Congratulations, you've got bloatware. It can be anything from a copy of the movie Avatar to the game The Sims 3, or any number of for-pay services you will never, ever use.

Getty

"What the fuck is this? A call button?"

Mobile phone companies have discovered that they can get fat sacks of cash by agreeing to place the apps of the highest bidder on your phone. Kind of like if Ford found out that they could put a huge, permanent Burger King logo on your back window and pocket some extra cash for every car sold.

Getty

And instead of an air bag, it just has a giant inflatable cheeseburger.

Currently, this is primarily an issue with Android phones. Google gives its wireless partners a lot of freedom with their software, so those companies do what comes natural to them and abuse the shit out of it. It can also crop up on some BlackBerry (yes, that's still a thing) and Windows Phone 7 devices.

Apple seems to be the only one immune to bloatware's curse so far, but that's only because it doesn't want to piss off the crazy, aloof guys making them boatloads of cash.

#2. Dark Fiber

What if we told you that there was an entire world of possibilities under your very feet, right this second? No, we're not talking about the mole people's domain over our Earth's core. We're talking about dark fiber -- a network of fiber-optic cable built in the late '90s and early '00s that's capable of speeds hundreds or thousands of times faster than your current Internet connection.

So what's this expansive network of ultrafast cabling used for? Basically, jack shit. That's why it's called dark fiber. The majority of it is unused. It's just there, taunting you and the rest of America with its untapped potential.

David Meyer

We may never experience the indulgence of "super porn."

The thing is, before 1996, telecommunication companies were regulated by the government. But with the Internet and new technology on the rise, the government decided they didn't understand shit about it all and mulled letting the telecoms regulate themselves. As a bargaining chip, telecoms promised anything and everything they could, including a fiber-optic network that would stretch across America, delivering at least 45MBps speeds (a number like that was incomprehensible back then). So lawmakers pretty much agreed out of hand. They passed the Telecommunications Act of 1996 and handed the keys for the nation's data infrastructure over to the telecoms.

Getty

At which point we assume they purchased a hollowed-out volcano.

Eventually, all the networks were built (using about $25 billion in tax breaks), but after the dot-com crash, several of the companies underwent mergers and bankruptcies, killing them off before they had a chance to set up the necessary hardware to interact with the fiber-optic lines. So who stepped in to buy them up? Big companies like AT&T and Verizon, who had a vested interest in keeping copper wires around for a little while longer (which they used for their cheaper-to-maintain DSL and telephone services).

Getty

"What do they need it for anyway? Geocities loads just fine on what we got."

Only recently have they exploited copper as far as they could and begun offering consumer-level fiber-optic television, phone and Internet services instead. As for the pieces of unused fiber that huge telecoms don't own, much is being bought up by Google, which is attempting to start its own fiber-optic Internet service. So we may finally start seeing fiber-optic Internet in the next few years, but we'll still be buying access from massive corporations. Progress!

#1. You Get Charged Differently Depending on How You Use the Same Data

Once upon a time, wireless carriers had unlimited data plans, just like the Internet connection you have at home (or used to have, anyway), and all was good. But then smartphones became king and several of the major U.S. carriers dropped back into capped data plans. But hey, those plans weren't really unlimited anyway, seeing as the companies would actually reduce your connection speed to almost nothing if you went over a certain amount of data in the month. So maybe it's not so bad. Now you know exactly how much data you're getting and you can use it any way you want as long as you don't go over the limit, right?

After all, if you have a 2GB cap, what does the phone company care what you use it on? It's all the same on their end.

Getty

It's no one's business where you telecommute to work from.

Actually, they have a big problem with it if you use it for tethering. See, some customers don't understand why they're paying separately for an Internet connection on their phone and another for their home computer (and some people can't get the latter at all). So they download software that will let their computer run off of their phone's Internet connection. Why not? As long as you stay under the cap for your plan, what does the phone company care if you're displaying cat videos on you Android phone's screen or your big PC monitor?

They care a lot, actually, because it means you're buying one plan instead of two. So if you want to run your phone's data plan -- the plan you're already paying for regardless -- through your PC, the provider will charge you $15 to $30 on top of your existing data plan.

Getty

"And look, the wiggly profit line goes up. Business."

In the case of Verizon and AT&T, the tethering plans each give you 4GB of data instead of the typical cap of 2GB, which isn't so awful ... but there's still no explanation why you can't tether with the lower-cost plans. Data is data, right?

Naturally, it's totally possible to hack your phone and tether it anyway, but phone companies seem to have gotten wise to this. For example, AT&T now sends you an email if you try it on their network, telling you that if you don't stop they'll automatically add the tethering charge to your future bills.

Getty

And they'll tell your mother exactly what you're using it for.

Title: BRING ON THE FLOODS AND DESTROY THE CELLS

TheUnhivedMind - June 22, 2011 12:42 AM (GMT)

Flooding affects cell towers

By Ross Boettcher
Published Tuesday June 21, 2011
http://www.omaha.com/article/20110621/MONEY/706219953

ONLY IN THE WORLD-HERALD
Flooding along the Missouri River has prompted AT&T and Sprint Nextel to take a number of cellular towers along the Nebraska-Iowa border offline, the companies said Monday.

Sprint has eliminated power and service to 12 sites in flooded areas along Interstate 29, and AT&T has turned off five towers in the same area.

All of the cell sites were switched off prior to the flooding along the Missouri River, and most of those areas have since been inundated with water, the companies said. Before switching off the equipment, Sprint and AT&T determined that flood levels would damage equipment, including radio and satellite facilities and the electronics that are stored underground, beneath each tower.

In addition to turning off some of its cellular operations, Sprint also has built a sandbag fortress and plugged pipes around one of its Omaha wire line switches that powers some of its business land- line customers in the Omaha metropolitan area, said Crystal Davis, a Sprint spokeswoman.

According to predictions, the floodwaters that have spilled from the Missouri River could rest in low-lying areas for months.

In the meantime, AT&T has erected two temporary cell sites in areas not affected by

flooding — one in Nebraska City and another between Omaha and Sioux City, Iowa — to service as much of the downed coverage area as possible, said Alex Carey, the AT&T spokesman.

“AT&T's goal of providing the very best connectivity to our customers, even when Mother Nature intervenes, led us to determine that erecting two temporary cell sites ... was the best possible course of action toward alleviating any impact on coverage,” he said.

Two areas affected most by the AT&T outages are the swath of I-29 between Pacific Junction, Iowa, and Nebraska City; and a patch between Little Sioux and Missouri Valley in Iowa, Carey said.

Sprint has moved capacity from the offline towers to other nearby sites, Davis said, and expects no impact for its customers. Davis said the company went that route because, in order to maintain all of the coverage lost by the downed towers, it would have had to install temporary sites in areas that also could be at risk for flooding.

Weeks ago, Verizon Wireless, Nebraska's largest cell phone provider, had to turn off a tower in Sioux City because of flood concerns but, like Sprint, it boosted capacity at other nearby towers to recoup the lost coverage, said Karen Smith, a Verizon spokeswoman.

Carey said AT&T decided to leave power antennas and power lines on its towers so that the company can quickly turn the sites back on when the floods subside.

Description: *leaked study reveals*

TheUnhivedMind - June 10, 2011 09:37 PM (GMT)

How just ONE mobile phone can make a plane crash, leaked study reveals

By Daniel Bates
Last updated at 3:43 PM on 10th June 2011
http://www.dailymail.co.uk/news/article-20...dy-reveals.html

Using just one mobile phone or electronic device during a flight can cause a plane's systems to shut down, a leaked study has found.

A single Blackberry or iPad can cause the auto pilot to disengage and critical warning lights to come on, testers discovered.

The instruments which guide pilots in bad weather can also be affected by the electrical signals from such devices - with potentially catastrophic consequences.

A confidential study by the the International Air Transport Association, a trade group representing more 230 passenger and cargo airlines worldwide, found that over six years there were 75 separate incidents which caused concern.

A previous probe by the UK Civil Aviation Authority found just 35 safety alerts blamed on phones over the same time scale.

The IATA experts called for passengers to stop ignoring warnings about electronic devices because they could cause the plane to crash.

Confidential tests by Boeing have revealed that the worst offender for electronic interference was the iPad, followed by the iPhone and the Blackberry.

In tests just one of each device left on sent out hidden signals which were well above what Boeing considered safe to fly on.

WHY YOU CAN'T USE A MOBILE IN THE AIR

The ban was brought in because safety officials suspected that the radio frequency emitted by cell phones could malfunction a plane's electronic systems.

It was feared that early cellular phones could possibly bleed over into the communications between the plane, other planes and ground communications.

Newer digital phones do not have this problem, but the ban remains, it is assumed, to save the airlines from having to deal with phone conversations and others complaining.

Others claim that the airlines would simply prefer passengers use the telecommunications systems mounted on seat backs in commercial airplanes, because these phones are said to be highly profitable.

ABC News reported that of the 75 incidents, 26 affected the flight controls including the autopilot and landing gear whilst seventeen affected navigation systems.

Some 15 caused problems for communications systems and 13 produced electronic warnings, including some for the engine.

The study also included pilot testimony such as one chilling account which read: ‘At about 4500 ft, the autopilot disengaged by itself and the associated warnings/ indications came on.

‘Flight attendants were immediately advised to look out for PAX (passengers) operating electronic devices

‘Attendants reported that there were 4 PAX operated electronic devices (1 handphone and 3 iPods).’

The crew used the public address system to advise the passengers to shut off electronic devices ‘for their safety and the safety of the flight,’ after which the aircraft proceeded ‘without any further incident’.

Dave Carson of Boeing, who has served on a U.S. advisory group that looked into the problem, said phones and electronic gadgets could cause major problems for pilots.

‘It could be you that you were to the right of the runway when in fact, you were to the left of the runway, or just completely wipe out the signal so that you didn't get any indication of where you are coming in,’ he said.

Asked if a phone's signal really can do that damage, he said: 'It is when it goes in the right place at the right time.'

Engineers have previously warned that the growing obsession with mobile phones and other gadgets could create a 'perfect storm' of interference with aircraft instruments to cause a crash.

Phone interference was cited as a possible factor in a 2003 crash in New Zealand in which eight people died after the plane flew into the ground short of the runway.

The pilot had been calling home.

In 2007, the navigational equipment of a Boeing 737 in the U.S. failed after take off, only to reactivate after a passenger was told to turn off a sat-nav.

600 TEXTS TO KEEP TRACK OF CHILDREN

Parents send 600 texts, 312 emails and spend 28 hours on the phone a year to track their children

Monday May 30,2011
By Daily Express Reporter
http://www.express.co.uk/posts/view/249649...ack-of-children

PARENTS send 600 texts, 312 emails and spend 28 hours on the phone a year – just trying to keep track of their children.

One in five admits the best way to find out where their child is is via social networking sites like Facebook.

The findings come from a study of 5,000 mothers and fathers by National Family Week.

More than half of parents think their children are overly preoccupied by their mobile phones and online networking.

Three quarters believe modern technology has had a bad affect on family life, with 17 per cent citing texting in particular and 37 per cent banning mobile phones or laptops at the dinner table.

Nick Henry, of National Family Week, said: “Having to contact your children in these ways is a consequence of modern life.

“Advances in technology have had advantages too.

“It could be argued that 20 years ago it would be harder to keep track of the family

throughout the day.”

MOBILE THREAT TO MEN'S FERTILITY

Radio waves from phones may damage fertility

Saturday May 21,2011
By Victoria Fletcher, Health Editor
http://express.co.uk/posts/view/247941/Mob...men-s-fertility

MEN who use mobile phones have poorer-quality sperm than those who do not, scientists say.

Those struggling to father children should cut back on mobile phone use to boost their chances, they suggest.

The scientists believe radio waves emitted by mobile phones could damage the structure of sperm and its ability to swim.

Their study, the findings of which are published in the International Journal of Andrology, concludes: "We speculate that mobile phones negatively affect sperm quality in men and may impair male fertility.

"Men with poor sperm quality planning for pregnancy should be advised not to use cell phones extensively."

The study, by a team at Queen's University in Ontario looked at men attending IVF clinics with their partners between 1993 and 2007. More than 2,000 had their sperm tested and were asked about mobile phone use.

They were divided into two groups: those who used mobiles and those who did not.

The researchers found that 68 per cent of mobile users had subtle changes in their sperm, against 58 per cent of non-users.

The first group also had higher testosterone levels but lower levels of another key element for reproduction, luteinising hormone.

Both groups had the same sperm count.

The researchers believe electromagnetic waves from mobile phones could have a dual action on male hormone levels and fertility.

They may increase the number of cells in the testes that produce testosterone. But by lowering -levels of hormone excreted by the pituitary gland, they may also block conversion of this basic -circulating type of testosterone to the more active, potent form associated with sperm production and fertility.

Researchers say more in-depth research is needed to determine the exact ways in which electromagnetic waves from mobile phones affect male fertility.

In the past two decades, a number of studies looking at the possibility that mobiles could affect fertility failed to produce conclusive evidence.

Meanwhile, the World Health Organisation has convened an eight-day meeting of experts to review existing studies on the health effects of electromagnetic radiation to decide if it can be labelled a carcinogen.

The meeting, at WHO's International Agency for Research on Cancer in Lyon, France, starts on Tuesday. Agency spokesman Nicolas Gaudin said scientists are expected to reach a verdict on May 31.

Since 1970 IARC has published more than 100 papers on the cancer-causing properties of asbestos, X-rays and the human papillomavirus, among others.

International studies involving millions of people recently concluded mobile phones were not a major health risk and there was little evidence they triggered cancer. But fears persist that electromagnetic waves, which heat up cells, could cause problems.

View Full Version: TSA backscatter radiation safety tests were rigged

Title: TSA backscatter radiation safety tests were rigged

TheUnhivedMind - May 21, 2011 01:02 AM (GMT)

TSA backscatter radiation safety tests were rigged

Tuesday, May 17, 2011
by Mike Adams, the Health Ranger
http://www.naturalnews.com/032425_airport_..._radiation.html

It can now be revealed by NaturalNews that the TSA faked its safety data on its X-ray airport scanners in order to deceive the public about the safety of such devices.

As evidenced by recent events in Washington, we now live in an age where the federal government simply fakes whatever documents, news or evidence it wants people to believe, then releases that information as if it were fact. This is the modus operandi of the Department of Homeland Security, which must fabricate false terror alerts to keep itself in business -- and now the TSA division has taken the fabrication of false evidence to a whole new level with its naked body scanners (see below).

Even physics professors question the TSA's obvious cover-up
The evidence of the TSA's fakery is now obvious thanks to the revelations of a letter signed by five professors from the University of California, San Francisco and Arizona State University. You can view the full text of the letter at: http://www.propublica.org/documents..

The letter reveals:

• To this day, there has been no credible scientific testing of the TSA's naked body scanners. The claimed "safety" of the technology by the TSA is based on rigged tests.

• The testing that did take place was done on a custom combination of spare parts rigged by the manufacturer of the machines (Rapidscan) and didn't even use the actual

machines installed in airports. In other words, the testing was rigged.

• The names of the researchers who conducted the radiation tests at Rapidscan have been kept secret! This means the researchers are not available for scientific questioning of any kind, and there has been no opportunity to even ask whether they are qualified to conduct such tests. (Are they even scientists?)

TSA operates in complete secrecy
None of the Rapidscan tests have been available to be subjected to peer review. They are quite literally secret tests using secret techniques engineered by secret researchers. We the People apparently have no right to see the data, nor the methodology, nor even the names of the researchers who supposedly carried out these safety tests.

• The final testing report produced from this fabricated testing scenario has been so heavily redacted that "there is no way to repeat any of these measurements," say the professors. In other words, the testing violates the very first tenant of scientific experimentation which is that all experiments must be repeatable in order to be verified as accurate.

As the professors state in their letter:

The document is heavily redacted with red stamps over the words and figures. In every case the electric current used which correlates one to one with X-ray dose has been specifically redacted. Thus there is no way to repeat any of these measurements. While the report purports to present the results of objective testing, in fact the JHU APL personnel, who are unnamed anywhere in the document either as experimenters or as authors, were not provided with a machine by Rapiscan. Instead they were invited to the manufacturing site to observe a mock-up of components (spare parts) that were said to be similar to those that are parts of the Rapiscan system. The tests were performed by the manufacturer using the manufacturer's questionable test procedures.

You got that? Where is the outrage from the "scientific" community on all this? This quack science TSA testing is so atrociously and inexcusably bad that if this fabricated evidence were presented at any sort of scientific meeting, they would be laughed off the stage and publicly vilified in the media. And yet, somehow, when the TSA engaged in this sort of quack science, virtually the entire scientific community says nothing. Only a small group of especially courageous scientists has stood up to this obvious quackery, and even these professors are of course being blasted in the press and called un-American for merely questioning the obviously flimsy evidence being laughably fronted by the TSA.

I mean, seriously: Can you imagine the total outcry if an herbal product company claimed that its products cured cancer, and it did all the testing itself, and all the names

of the researchers were kept secret, and the methodology was a secret, and the whole document was 50% redacted to protect "proprietary information?" They would actually be arrested by the federal government for running a criminal scam! So why can the TSA get away with the exact same scandalous junk science distortions and virtually no one in the mainstream media asks a single question?

The complete fabrication of safety in the name of false science
It's amazing what America has come to these days, folks. The federal government isn't merely counterfeiting money every day (or stealing from your retirement accounts to keep itself afloat, which just started happening yesterday), but the feds are also fabricating scientific evidence to keep pushing their utterly fabricated "war on terror." The feds in Washington aren't really fighting a war on terror... they ARE the terror! When the feds reach down your pants and feel your junk; when they force you to be fried with high-powered X-rays at the airport; and when they threaten anyone who stands up to their Nazi-like marching orders, they have become the very terrorist organization they claim to be fighting.

• The dose rates of X-rays being emitted by the Rapidscan machines are actually quite high -- comparable to that of CT scans, say the professors. Yes, the dose duration is significantly lower than a CT scan, but the dose intensity is much higher than what you might think. And as anyone who knows a bit about physics and biology will tell you, the real danger from radiation is a high-intensity, short-duration exposure. That's exactly what the TSA's backscatter machines produce.

• The radiation detection device used by Rapidscan to measure the output of the machines -- an ion chamber -- is incapable of accurately measuring the high-intensity burst of radiation produced by the TSA's naked body scanners, say the professors.

• At the same time, the radiation field measurement device used by the TSA -- a Fluke 451 instrument -- is incapable of measuring the high dose rates emitted by backscatter machines. The measurement devices, in effect, "max out" and cannot measure the full intensity of the exposure. Thus, the TSA's claims of "low radiation" are actually fraudulent. By the way, the device mentioned by the TSA really is an F 451. Does that ring a bell in terms of fiction novels? (http://en.wikipedia.org/wiki/Fahren...)

• The amount of electrical current applied to the X-ray tubes has been redacted by the TSA (working with John Hopkins). This makes it impossible for third-party scientists to accurately calculate the actual radiation exposure, and it hints at yet more evidence of a total TSA cover-up. As explained by the professors:

...the X-ray dose is proportional to the current through the X-ray tube. Not having access to the current used in the JHU test, or in the field application of the scanner means that the measurements at JHU are irrelevant to the dose at the airport. There is also no data on the pixel size and overscanning ratio, which also bear directly on the

dose delivered to subjects. The statement in the HHS letter that the fluence is not a relevant quantity ignores fundamental physics.

There shall be no independent testing whatsoever
The TSA adamantly refuses to allow independent testing of the radiation levels being emitted by the machines. The agency is using the cover story that "terrorists might be able to circumvent the technology" if anyone is allowed to actually test the machine.

Hilarious! This is the very definition of quack science. You have to trust our in-house fabricated experiments, and we won't tell you how we even arrived at our test results, and we won't release the names of the scientists who even ran the tests, but we can't tell you more because of the terrorists.

Notably, this is after Osama Bin Laden has already been killed, and he was the whole reason the TSA started up in the first place. The terror mastermind is dead, in other words, and still the TSA can't trust university physics professors to conduct credible science on its naked body scanners.

Actual radiation emitted by the machines is far higher than what the TSA claims
John Sedat, a professor emeritus in biochemistry and biophysics at UCSF and the primary author of the letter says, "..the best guess of the dose is much, much higher than certainly what the public thinks." This indicates the public has been deeply misled by the actual amount of radiation emitted by the machines.

• Peter Rez, the physics professor from Arizona State, says that the high-quality images described by the TSA could not be produced with the low levels of radiation being claimed by the TSA. The images, in other words, don't match up with the TSA's cover story. Rez estimates the actual radiation exposure is 45 times higher than what we've previously been told.

• The TSA machines are capable of firing even higher levels of radiation into a "region of interest" (such as your anus or scrotum, in which the TSA seems to be taking great interest these days), thereby exposing that region to even higher levels of radiation than the rest of your body.

Mechanical failure and software bugs
The backscatter scanning devices uses a high-powered X-ray beam that is quickly moved back and forth across your body by reflecting the beam off a moving wheel. If that wheel fails for any reason and stops moving, the traveler could be pierced with a deadly X-ray beam that focuses extremely high levels of radiation on a small group of cells, mutating their DNA.

This means the backscatter devices are mechanical systems, and all mechanical systems eventually fail (just like airplanes). The TSA has done absolutely nothing to

address the reliability of these mechanical wheels nor to allow independent testing of the reliability of these wheels.

• The TSA refuses to allow independent scientists to review its software code that controls the radiation beam. Thus, the software and its capabilities also remain a complete secret. What if there's a software bug that causes 10,000 times the usual radiation exposure for some unlucky traveler? Suppose the pervert TSA agent zooms in on some 9-year-old child's junk to capture a picture for his own private collection... does that result in yet more radiation? (Fact: One TSA agent has already been arrested for distributing child pornography.) (http://www.tsagoons.com/2011/04/23/...)

See more at www.TSAgoons.com (warning: graphic language and imagery on that site.)

What science? We don't need no stinkin' science!
As we're all now learning, the TSA completely bypassed the normal procedure for independent testing of equipment to be used on the public. As explained by the professors:

The independent testing of the safety of these specific scanners has not been rigorous nor has it been held to the standards usually associated with new devices before approval for utilization in the public sector. Usually the exact technology, as installed, is sent to a university, national laboratory or other outside facility that has the expertise to test, for an extended period of time to enable an in-depth study -- usually by several independent groups.

The U.S. government, however, no longer feels it needs to engage in any "scientific" testing whatsoever. Why bother? The government can simply fabricate whatever results it wants and then release those to the mainstream media which will dutifully reprint the government's lies as if they were facts. The truth is no longer relevant to the government's tyrannical agenda. As long as no one questions the lies, it hardly matters how unreasonable or bizarre those lies become. Government can always play the terrorism card and force people to shut up and stop asking questions, you see. "How dare you question our integrity. We're the government! We're protecting YOU from terrorism!"

Sure they are. By feeling up my anus? Seriously? If it wasn't actually true, it would be hilarious.

What is the TSA hiding?
NaturalNews asks the obvious question: Why won't the TSA subject its backscatter scanning machines to independent testing? Why won't it allow five different university physics departments to conduct five independent tests -- using documented equipment and methodologies -- and thereby assure the public, with credibility, that its machines are perfectly safe?

I can tell you why: Because the TSA is lying. The agency has fabricated its test results. It has conspired to deceive and mislead the American public over the safety of these machines, and it has done so through an agenda of government secrecy and scientific fraud. The TSA, lacking any credibility whatsoever, has resorted to routine lying about its machines, its procedures and its intentions. When 6-month-old babies have their rear-ends searched by TSA agents wearing evil grins (http://scottystarnes.files.wordpres...), you know it's all gone too far.

The TSA refuses to allow independent testing of its machines because it knows what NaturalNews readers already know: That if the machines were honestly and accurately tested, they would show far higher levels of radiation exposure than what we've been told. It would show that the TSA's body scanners significantly increase the risk of cancer to a population that is already over-irradiated with medical imaging tests such as CT scans and chest X-rays.

The TSA, like virtually every other department of the federal government, is now actively engaged in the routine falsification of the scientific data concerning a device that is exposing millions of Americans to an increased risk of cancer. And as long as the federal government claims to have "supreme power" while refusing to answer to the People, we're only going to get more of this tyranny in the months ahead.

The TSA has become the terrorist organization
This is not merely unacceptable; this is a CRIME against the American people. These TSA body scanners are, effectively, Weapons of Mass Destruction that are unleashing ionizing radiation upon an unsuspecting public.

And they are doing it right in your face; telling you it's all perfectly safe while, behind the scenes, they had to engineer a specially-rigged unit just to run their rigged tests using measurement devices that can't even record the high levels of radiation actually being emitted.

The public backlash against these devices is so strong and so loud that news crews have to interview dozens of people on camera just to find one person to actually say something positive about the TSA's pat-down and ionizing scanners. That's the report from Alex Jones, who has also been covering TSA tyranny in great detail. The popularity of his www.Infowars.com website is exploding in the wake of the government's increasingly bold lies and disinfo campaigns that frankly are backfiring on them. A lot of people are easily fooled, but just as many aren't. Probably 95% of all travelers are absolutely opposed to everything the TSA forces them to go through at the airport.

That's why Texas is about to pass a law that would criminalize TSA agents who reach down your pants and molest you or your children. But the TSA has put out a preemptive

statement on its blog that claims none of this matters. "States cannot regulate the federal government," the TSA claims. And it actually quotes the U.S. Constitution as the source of its power! (What about the Fourth Amendment of the Constitution? How convenient that they forgot all about that part, eh?)

The passage of this law could lead to a fascinating showdown in Texas. What we need is a group of Texas Rangers to march into the airport in Dallas and arrest the TSA agents, handcuff them, and march them off to jail. Then let's see the feds try to invade Texas to free their criminal TSA agents. That should be amusing. I've spent some time in Texas, talking with the locals, and I can guarantee you that a bunch of tyrant feds trying to invade Texas are going to be absolutely shocked at the intensity of the public resistance they will meet.

The growing TSA resistance movement
By the way, with the TSA's molestation of children and outright lying about the safety of its machines, the federal government is vastly overestimating the stupidity of the general public. People are taking notes of the encroaching tyranny, and while they may pretend to voluntarily walk through the TSA's security checkpoints right now, there will come a day when the American people simply refuse to be herded like cattle anymore. I predict a widespread backlash against the TSA, reflected through state legislative efforts and public protests that will demand an end to the TSA which has now come to mean "Touch Some Ass!"

The hilarious ending to all this, by the way, is that the backscatter machines are also dosing all the TSA workers with regular bursts of ionizing radiation, meaning that the very people working for the tyrannical TSA are, themselves, victims of its deception.

Somehow, that seems incredibly fitting.

Title: NIGHTMARE OF MUM ALLERGIC TO ELECTRICITY

TheUnhivedMind - May 18, 2011 12:40 AM (GMT)

NIGHTMARE OF MUM ALLERGIC TO ELECTRICITY

Wednesday May 18,2011
By Allister Hagger
http://express.co.uk/posts/view/247341/Nig...-to-electricity

MEET the woman who is so allergic to modern technology that her neighbours cannot have wireless internet.

Janice Tunnicliffe has a rare condition called electrosensitivity – meaning she cannot bear to be anywhere near electromagnetic fields.

As a result she cannot use an electric kettle and keeps her washing machine sealed in a concrete outhouse and spends every night playing board games by candlelight with her second husband Carl, 43.

She cannot watch TV, listen to the radio or talk on a mobile phone and has been left isolated from the modern world by her problem.

Carl had to ask the neighbours if they would mind reverting to cabled internet. Janice has even had to cover her windows with a special metallic material to deflect errant electromagnetic waves.

The mother of two, 55, was struck down with the illness after receiving chemotherapy for bowel cancer three years ago.

Since then she has suffered from constant headaches, chest pains, nausea and tingling in her arms and legs whenever she is near electrical devices or items that emit a signal.

Her only relief came when her village near Mansfield in rural Nottinghamshire had a

power cut.

She said: “Different feelings give me different feelings but it’s mostly headaches and nausea. iPhones make me feel really sick within about 20 minutes of being near one so even though I might not realise someone has one straightaway, I soon find out.

“Wifi makes me feel like I have a clamp at the back of my head squeezing the life out of me. It’s completely draining and a home hub can totally immobilise me – I’m left unable to move my arms and legs.”

She added: “In the beginning I thought it must be the after-effects of the chemo, but when I went to see my oncologist six months later he was amazed that I was still suffering.

“I’m lucky because I live in a fairly rural area but I could never live in a town again. We are hoping to sell our house soon and move somewhere even more remote.

“I would happily live without electricity for the rest of my life and I don’t miss it at all.”

Dr Sarah Myhill, who practises privately in Wales, said: “To my mind there is no doubt electrosensitivity is a real phenomenon – I have seen far too many people affected by electro-magnetic radiation to think otherwise.

“In my clinic I nearly always see electrical sensitivity in people already suffering from some form of chemical sensitivity.

“There are many symptoms that can be switched on by electrical sensitivity and it appears that almost any electro-magnetic frequency can be the cause.”

Mobile phones and wi-fi 'should be banned from schools as they are potentially harmful'

By Oliver Pickup
Last updated at 4:37 PM on 15th May 2011
http://www.dailymail.co.uk/news/article-13...ly-harmful.html

Wireless devices 'can cause cancer and affect developing brains'
Mobiles 'might have cognitive effects and impact on sleep' says professor leading separate study

An influential European body has warned that mobile phones and wi-fi Internet connection should be banned from schools as they are 'potentially harmful' to pupils.

A committee set up by the Council of Europe, which has 47 member states, has released a report which believes that it is crucial to tackle the issue now before it's too late, as was the case with smoking, lead in petrol and asbestos.

In addition, the detailed report from the Strasbourg-based organisation underlines the potential health risks that cordless telephones and baby monitors provide.

Both rely on similar technology to mobile phones and wi-fi, and are commonly found in homes across Britain.

The body believes that electromagnetic radiation emitted by wireless devices is conducive to cancers and may affect the developing brain.

The committee, which was made up of 84 MPs and politicians from member states, believes that member states should impose the following:

Introduce thresholds for levels of long-term exposure to microwaves emitted by mobile phones;
Make sure there is clear labelling on products which indicates that electromagnetic fields could be harmful;
Have a strict ban on all mobile phones and wireless networks in schools;
Begin information campaigns, aimed at children and young adults, about the risks to human health;
Increase research on less-dangerous types of antennae and mobile phones.

The World Health Organisation and the Department of Health had earlier ruled that exposure to electromagnetic fields poses little or no risk to human health, so these findings contradict that school of thought.

The Council of Europe - a highly respected organisation whose findings tend to steer government legislation - called on heads of state to 'take all reasonable measures to reduce exposure to electromagnetic fields'.

The ban on mobile phones in schools was adopted unanimously by the organisation's Committee on the Environment, Agriculture and Local and Regional Affairs.

Wireless phones are a risk to health, the Council of Europe committee found, and baby monitors are also thought to be harmful

The committee, whose vice-chairman was Lord Prescott, the former Deputy Prime Minister, will now read the draft resolution to the council's full Parliamentary Assembly for approval.

But telecommunications companies have long held the belief that there is no association between mobile phones and adverse health effects.

Further, other studies have found no association between short-term mobile phone use and cancer.

Indeed, a large-scale epidemiological study, which found no link between cancer and mobile phone usage, was published last year.

Professor Les Barclay, the vice-chairman of the Mobile Telecommunications and Health Research Programme, told the Sunday Telegraph: 'We haven’t had mobile phones for very long and there are now studies going on to look for longer-term effects.

'There is very little evidence at the moment for harmful effects. The powers that mobile phones emit are getting less and less, and they are well below the limits set by the International Commission on Non-Ionising Radiation Protection.

'Banning mobile phones and wireless networks in schools is a step too far in my eyes.'

And John Cooke, Executive Director of the Mobile Operators Association, who represent the four UK mobile network operators, told MailOnline: 'The science around radio waves and mobile phones has been extensively researched, and the position of the World Health Organisation, the UK Health Protection Agency, and other national health agencies around the world is that, after all the research carried out to date, no adverse health effects have been established for mobile phones operating within international exposure guidelines.

'This report, which has yet to be debated by the standing committee of the Council of Europe, has a different opinion of the science from that of a whole host of independent national and international scientific authorities.

'Policies on public exposure to radio waves should be based on the best scientific evidence available. Recommendations for non-scientific restrictions are not supported by the WHO or the Health Protection Agency and will provide no health benefit, cause unfounded public concern and impact the quality of mobile services relied on by millions of individuals, and by public services and businesses.'

However, a separate study, led by Professor Paul Elliot of Imperial College, London, was more damning.

'There are potential questions about whether mobile phones might have cognitive effects and impact on sleep,' Prof Elliot was quoted as saying in the Sunday Telegraph.

'Mobile phone technology is clearly incredibly beneficial and useful, but we have to weigh up those potential health effects, so it is responsible to do research on that.

'In children, that research has not yet really been done, so we need more research in this area. In the meantime the advice is not to be excessive in use.'

General secretary of the National Association of Head Teachers, Russell Hobby, said that a ban on mobile phones and wireless networks in schools would cause chaos.

'The impact on schools would be enormous,' he told the Sunday Telegraph. 'Most schools have wi-fi networks now, while pupils and teachers carry mobile phones.

'Many schools are shifting towards far more mobile computing so pupils can have laptops they can take home to do their homework on. This would prevent all of that.'

View Full Version: Why a mobile phone ring may make bees buzz off

Title: Why a mobile phone ring may make bees buzz off

TheUnhivedMind - May 15, 2011 02:52 AM (GMT)

Now just what if the magnetic field of the earth is altering and those bees that are nonorganic are suffering more trying to latch onto the new field? Remember a bee has a high metabolism and thus needs its food, if it can't find its way back to the hive then it will die away from the hive due to starvation. Also rather than cell phones could it be HAARP hindering these non organic bees with the aerosol programs?

QUOTE

Why a mobile phone ring may make bees buzz off: Insects infuriated by handset signals

By David Derbyshire
Last updated at 2:45 PM on 13th May 2011
http://www.dailymail.co.uk/sciencetech/art...et-signals.html

Signals from mobile phones could be partly to blame for the mysterious deaths of honeybees, new research shows.

In the first experiment of its kind, a bee expert placed a mobile phone underneath a hive and then carefully monitored the reaction of the workers.

The bees were able to tell when the handsets were making and receiving calls, and responded by making the high pitched squeaks that usually signal the start of swarming.

Impact: Researchers found bees responded when mobile phones were used to make and receive calls

Dr Daniel Favre, who carried out the experiment, believes signals from mobile phones and masts could be contributing to the decline of honeybees and called for more research.

But British bee experts say there is still no evidence that mobile phones posed a risk.

They blame the vanishing honeybees on changes in farming, the decline of wild flowers and pesticides.

The number of honeybees in the UK has halved in the last 25 years while in America bees have been badly hit by 'colony collapse disorder' - the sudden disappearance of entire colonies over winter.

Experts say bees have been badly hit by the varroa mite, a blood-sucking parasite that makes colonies vulnerable to disease, freak weather or poisoning.

More...
The WMD of insect repellant: Bug spray developed that's a THOUSAND times more powerful than regular stuff
Ghost of the abyss: Eerie dance of the deep-sea octopus captured on video 1.25 miles under the Pacific Ocean

Some experts say the latest generation of pesticides may disrupt the nervous systems of bees, causing them to get lost and confused.

And most bee experts say the creatures are suffering from the loss of wild flowers, meadows, rough pasture and untidy gardens.

However, a handful of experts say mobile phones could also be partly to blame.

Dr Favre, a teacher who previously worked as a biologist at the Swiss Federal Institute of Technology in Lausanne, said: 'This study shows that the presence of an active mobile phone disturbs bees - and has a dramatic effect.'

He placed two mobile phones under a beehive and recorded the high pitched calls made by the bees when the handsets were switched off, placed on stand-by and activated.

Around 20 to 40 minutes after the phones were activated, the bees began to emit "piping" calls - a series of high pitched squeaks that announce the start of swarming.

Within two minutes of the phone call ending, the worker bees calmed down.

In the study, the bees did not swarm - even after 20 hours' exposure to mobile phone signals. However, the onset of unexpected swarming triggered by mobile phone signals could have 'dramatic consequences in terms of colony losses', Dr Favre reports in the bee keeping journal Apidologie.

The study did not show that mobile phones were deadly for bees, he said.

"But one hypothesis is that electromagnetic fields could be contributing to the disappearance of bee colonies around the world," he added.

But British bee expert Norman Carreck of Sussex University said: 'It's an interesting study but it doesn't prove that mobile phones are responsible for colony collapse disorder. If you physically knock a hive, or open one up to examine it, it has the same result.

'And in America many cases of colony collapse disorder have taken place in remote areas far from any mobile phone signals.'

Title: Climate change 'threatens UK wi-fi connections',
Description: *says Gov report [KILL IT PLEASE!]*

TheUnhivedMind - May 9, 2011 05:47 PM (GMT)

Climate change 'threatens UK wi-fi connections', says government report

Study into impact of hotter, stormier weather on UK infrastructure finds threat to wi-fi range and signal strength

• UK infrastructure 'will struggle to cope with climate change'

Damian Carrington
guardian.co.uk, Monday 9 May 2011 16.01 BST
http://www.guardian.co.uk/environment/2011...-fi-connections

Wi-fi internet access and other communications are at risk from global warming unless measures are taken to protect them from rising temperatures and stormier weather, a government report warned on Monday.

Presenting the report, the secretary of state for the environment, Caroline Spelman, said that higher temperatures can reduce the range of wireless communications, rainstorms can impact the reliability of the signal, and drier summers and wetter winters may cause greater subsidence, damaging masts and underground cables.

The threat posed by climate change to internet and telephone access is a rare example of when the developed world would be hit harder than developing countries, which are in general more at risk from increased floods, droughts and rising sea levels.

"If climate change threatens the quality of your signal, or you can't get it because of extreme fluctuations in temperature, then you will be disadvantaged, which is why we must address the question," said Spelman, "and just imagine in the height of an emergency if the communications system is down or adversely affected."

The report is on how the UK's infrastructure – from road and rail, to power stations, to water supplies – needs to be made more resilient to climate change.

The government acknowledges that the impact of climate change on telecommunications is not well understood, but the report raises a series of potential risks. In addition to the impact on range and reliability, warmer temperatures and more intense storms may cause communications infrastructure to be flooded, or damaged by an increase in trees falling onto overhead lines. There is even the suggestion that changes in the plants that grow in the UK could affect how radio waves travel.

Transport minister Theresa Villiers said: "When Defra started out looking at this issue, communications were not necessarily at the heart of the adaptation strategy. But communications is pivotal to making everything else work, which is why it has become much more high profile in the government's work."

Chief policy adviser to Greenpeace, Ruth Davis, said: "What this report reminds us is that sudden shifts in global climate will affect our world and our daily lives in chaotic and unusual ways. The UK will not be immune, and the government's discovery that one of the most important sectors for the UK's economic recovery – electronic communications – could be affected by climate change, shows just how vital it is for our prosperity that we curb emissions now."

The UK's entire major infrastructure will be affected by climate change, the report found, with examples of measures being introduced or needed including:

• New types of road surfacing to prevent the tarmac melting during hot spells

• More heat-resistant rail tracks to prevent buckling

• The bolstering of road and rail embankments and bridges to protect from flooding or subsidence

• Better flood protection for nuclear and fossil fuel power stations

• Wind turbines designed to withstand stronger winds

• Stronger overhead power cables to avoid wire expansion and sagging in hotter summers.

"£200bn is expected to be invested in the UK's infrastructure over the next five years," said Spelman. "Infrastructure assets often have lives of at least 50-100 years so they need to be designed to function long into the future when the climate is projected to be very different."

Many of the risks to communication, transport and energy infrastructure stem from the predicted increase in flooding, a threat accepted as real by the government. But Spelman said the report's call for more investment by the private sector did not contradict the coalition's cuts to public spending on flood and coastal defences.

"I don't think it is a hypocrisy at all. For Defra, our top priority was to protect flood defence capital and we came up with the third best settlement for capital of any government department. We are also approaching the building of flood defences in a new way." Instead of all flood defence projects being 100% state-funded, she said, Defra will allow "co-funding" of flood defences by communities.

Jamie Reed, Labour's shadow environment minister, said: "The government is trying to have it both ways, promising to tackle climate change whilst at the same time undermining the policies necessary to deliver a low-carbon economy. The government have just slashed the flood defence budget by 27%, cancelling major projects across the country."

The report was launched at the site of the new Blackfriars rail and underground station in London, which will span the river Thames. The bridge supports have been strengthened in anticipation of greater tidal surges and increased scouring. To reduce the station's dependency on other infrastructure and to lower carbon emissions, its roof will host the largest installation of solar photovoltaic panels in the UK. The 600 sq m project will provide 1 MW of energy – up to 50% of the station's electricity needs.

Title: Review: mobile phone Signal Boost from Orange
Description: *[DEATH IN YOUR HOMES]*

TheUnhivedMind - April 21, 2011 10:37 PM (GMT)

Review: mobile phone Signal Boost from Orange

Orange has a nifty wireless solution to dropped mobile calls... and its free

By Techbyte 2:08PM BST 21 Apr 2011

Every mobile phone network claims more than 99 per cent coverage by population. So why do you keep falling into the 1pc who can't get a signal?

Every network has dead spots but when that black hole coincides with a staffer's desk, at home or in the office, it's a pain and significantly reduces their ability to stay in the loop. Even if the landline is working perfectly, many business people prefer to give out their mobile number so they're always accessible.

I've looked before at some of the ways to overcome a flaky phone signal, which Orange reckons affects one in five of us in our homes.

Vodafone users can invest in the excellent SureSignal which works like a tiny phone mast that connects to your router. The Gigaset Pro DX800A business landline reviewed here a few weeks ago allows you to connect your mobile to your desk phone via Bluetooth.

But one network, Orange, has another solution. UMA stands for Unlicensed Mobile Access and offers a cost-free solution, if you have the right handset.

It works by using your wi-fi broadband network at home or in the office. Connect your phone to the network, basically by entering your wireless router password. Then, provided you can pick up the wireless signal okay, you can receive and make phone

calls too.

As well as being exceptionally simple to set up, you can choose whether to prefer UMA over the mobile network or the other way round, or set it to only permit UMA connections when you're in reach of the wi-fi signal. Either way, it works seamlessly, automatically connecting as it needs to.

The effect is startling. Call quality is adequate rather than exceptional but suddenly it's reliable – no more calls dropped as you step away from the window – which is reassuring. At last you know you're not missing an important call.

There are no extra costs – the minutes are charged to your standard tariff. The only downside is that the range of compatible phones is limited – fewer than a dozen at the moment. This does include the best BlackBerry devices around: the Bold 9780, Curve 8520 and the Torch, plus the Nokia E5 and LG Optimus One.

Overall though, it's a brilliantly simple, cost-free solution to a deeply annoying problem. And it means your employees won't be able to use the excuse that their phone didn't ring.

Signal Boost with UMA by Orange

5 stars

Description: *Boost Your Risk of Cancer*

TheUnhivedMind - April 20, 2011 03:07 AM (GMT)

Each Time You are Exposed to This Machine, You Boost Your Risk of Cancer

Posted by: Dr. Mercola | April 19 2011
http://emf.mercola.com/sites/emf/archive/2...-doctor-do.aspx

The Transportation Security Administration (TSA) claims that backscatter scans are safe. But how do medical professionals personally feel about it?

Many doctors don't opt out of the scans. Dr. Drew Pinsky calls the amount of radiation "inconsequential." However, some researchers question whether the manufacturers' measurements are valid -- the exposure to radiation may actually be 10 times more than what the manufacturers claim.

And Dr. Otis Brawley, chief medical officer of the American Cancer Society, takes a pat-down instead of going through a scanner when he travels. Brawley's deputy, Dr. Len Lichtenfeld, has the same opinion.

According to CNN:

"Lichtenfeld says it doesn't necessarily give him great comfort that the TSA says the scans are safe. 'I can still remember getting my feet radiated as a child when I went to the shoe store and they had a machine which could see how my foot fit in the new shoes,' he says. 'We were told then that they were safe, and they were not.'"

View Full Version: The young generation are 'addicted' to cell phones

Title: The young generation are 'addicted' to cell phones
Description: *[TRACKED, TRACED AND F***ED UP]*

TheUnhivedMind - April 19, 2011 05:19 PM (GMT)

The young generation are 'addicted' to mobile phones

Young people are now so addicted to their mobile phones it feels like they have lost a limb when they are without them, a study finds.

By Richard Alleyne, Science Correspondent 5:30AM BST 19 Apr 2011
http://www.telegraph.co.uk/technology/8458...ile-phones.html

Some said they feel so bereft without their iPhone or Blackberry that it evokes similar feelings to the "phantom limb" syndrome suffered by amputees.

The findings, by the University of Maryland, show the growing reliance that the younger generation has on technology and how it has become central to their lives.

While phones were the most essential device, other technology such as computers, MP3 players and televisions were also considered essential to get people through their day.

Many young people reported mental and physical symptoms of distress and “employed the rhetoric of addiction, dependency and depression,” when reporting their experiences of trying to go unplugged for a full day.

“Students talked about how scary it was, how addicted they were,” said Professor Susan Moeller, who led the project.

“They expected the frustration. But they didn’t expect to have the psychological effects, to be lonely, to be panicked, the anxiety, literally heart palpitations.”

The study titled "The World Unplugged project" asked more than 1,000 students from 10 countries around the world, including Britain, to go without any media for 24 hours and monitored their feelings.

Prof Moeller said that more than 50 per cent of students failed to go the full 24 hours and everyone claimed to suffer some kind of withdrawal symptoms.

Ryan Blondino, a student at the University of Maryland who participated, compared the experience of going without digital technology to missing a limb.

“I felt something very similar to a phantom limb, only it would be like phantom cellphone,” he said.

“I still felt like my phone was vibrating and I was receiving messages even though I didn’t have it on me.”

A student from the UK said: "Media is my drug. Without it I was lost. I am an addict."

The study found few differences in the way students used and relied on digital technology in different countries, despite those countries’ huge differences in economic development, culture and political governance.

It concludes that most college students, whether in developed or developing countries, are strikingly similar in how they use media – and how 'addicted' they are to it.

They all used virtually the same words to describe their reactions, including: Fretful, Confused, Anxious, Irritable, Insecure, Nervous, Restless, Crazy, Addicted, Panicked, Jealous, Angry, Lonely, Dependent, Depressed, Jittery and Paranoid.

In effect, cell phones have become this generation's security blanket."

The report was published by the International Center for Media & the Public Agenda.

View Full Version: GIRL, 11, DEFEATS PHONE GIANTS IN MAST BATTLE

Title: GIRL, 11, DEFEATS PHONE GIANTS IN MAST BATTLE

TheUnhivedMind - April 18, 2011 05:51 PM (GMT)

GIRL, 11, DEFEATS PHONE GIANTS IN MAST BATTLE

Monday April 18,2011
By Andy Russell
http://express.co.uk/posts/view/241349/Gir...-in-mast-battle

A SCHOOLGIRL has won a David and Goliath-style battle to protect her family from radiation from a mobile phone mast planned yards from her home.

Natalia Gumbrill, 11, was worried about the health implications from microwaves the mast would emit.

Mobile phone giants Vodafone and O2 wanted to erect the 50ft structure at the end of her road – within half a mile of four primary schools in Hazel Grove, Stockport, Manchester.

Natalia wrote to local councillors and her MP to raise concerns about possible long-term effects on sister Beth, 14, and seven-year-old brother Sam.

The feisty youngster warned officials, including local government minister Andrew Stunnell, that she would hold them “personally responsible” for any ill-effects caused to residents if the mast was given the green light.

Her campaign succeeded when the planning committee rejected the application on Friday after hearing there were 180 objections from residents.

Natalia said: “I’m so pleased the mast won’t be put here now. This is definitely the right decision.

“They were thinking of putting it so close to schools. It’s worrying that it could damage and affect people and be one of the causes of cancer. I was worried for my brother Sam. He’s only seven and his brain is not fully developed.”

In a letter to her local councillors, the heads of the four schools, and Lib Dem MP Mr Stunnell, Parliamentary Under secretary for Communities and Local Government, Natalia said: “If in the future it is proven that these masts do cause health issues, I will personally hold Stockport Council responsible for any proven health issues to any local resident in the affected area.

“I will draw your attention to the fact there are four schools within half a mile radius of the proposed telephone mast, and many houses.

“I am sure any sensible person would understand this is not a suitable location for a telephone mast.”

Natalia added yesterday: “The councillors represent our area and it’s their job really – so it would have been stupid not to write to them. I’m hoping it will be moved to an area further away in a field somewhere so it can’t hurt anyone.”

Steve Burns, Stockport Council’s planning chief, said: “The application for the telephone mast has been refused.

“This is due to the height, appearance and prominent siting of the mast, which would have a negative visual impact on the surrounding area.”

View Full Version: Worldwide Electronic Mind Control via 'Cell Phone'

Title: Worldwide Electronic Mind Control via 'Cell Phone'
Description: *Towers*

TheUnhivedMind - April 18, 2011 03:47 AM (GMT)

Worldwide Electronic Mind Control via 'Cell Phone' Towers

OCC elf tower The day is now approaching in which government mind control technologies will be directed at you, your neighbors, and your loved ones. Every single day, equipment is being erected and installed in this country with the hidden purpose of exerting mind control over the entire population. Everywhere in this country (and overseas), ELF/microwave transmission towers are being erected. The antennae usually look like four slightly curved vertical plates about 2 feet in length and located in either 3 or 4 quadrants around the tower, two thirds up from the ground. Just look around, you'll see them. And you'll also notice more of them going up once you begin to pay attention. No one is saying anything, but you're expected to presume that they're for cell phones. (Do you really think that we need that much 'cell phone' transmission capability, every few blocks? Do you realize how very little energy is used by genuine cell phone usage? Yet these towers are capable of putting out levels of power that exceed cell phone requirements by a wide margin) These mind control technologies have been in place for a long time. It's not an accident that the frequency band chosen for cell phone use just happens to match the second order waves that Wilhelm Reich discovered in the late1940's to effect thought transmission and allow the mind to be manipulated without the victim realizing it. Reich worked on this project secretly for the CIA for over 5 years, from 1947-1952, until he realized who the CIA was planning to use the mind control on -the American people. He was outraged that he was deceived and used for such a treasonous motive and swore never to cooperate with the CIA, FDA, etc. again. Reich was covertly murdered in Federal prison in 1957, just a few weeks before he was due to be released, having been in prison for 2 years on a trumped up charge leading to a contempt of court citation. He was reported to have had a 'heart attack'. He was strong as an ox. He was murdered two weeks before his parole board hearing. His last book, written in prison, was found to be 'missing' after his death and never returned to his family.

A method was discovered to disable these ELF towers from exerting their mind control functions by placing a simple device known as an orgone generator within a radius of 1,300 feet of these towers. These microwave towers are used in conjunction with HAARP based technology to not only affect subliminal mind control influences, but also to control the weather (currently {2007}, the creation of artificially induced drought conditions are also greatly influenced by the population-reduction chemtrail spraying operations which take place daily over the skies in America and in many other countries) .

Patrick Flannagan also recorded an interview with talk show host Jeff Rense on June 30, 2003 and offered important insights on how to counter electronic mind control being beamed to us from the electric wiring within our homes and from microwave towers (promising information that should be studied).

View Full Version: Block mobile phones to curb the Mr Bigs in prison

Title: Block mobile phones to curb the Mr Bigs in prison
Description: *says top judge*

TheUnhivedMind - April 12, 2011 03:43 AM (GMT)

Block mobile phones to curb the Mr Bigs in prison, says top judge

Martin Bentham, Home Affairs Editor
11 Apr 2011
http://www.thisislondon.co.uk/standard/art...ys-top-judge.do

Mobile phone jamming equipment should be installed in prisons to stop inmates running their criminal empires, one of Britain's most senior judges urged.

Lord Justice Hughes, vice-president of the Court of Appeal's criminal division, said that mobiles were a "currency" used by the "seriously malign" to run prisons by bullying and controlling the sale of drugs. He also warned that they were being used to intimidate witnesses to stop them giving evidence in court.

Lord Justice Hughes's comments, at a Bar Council debate in London on prisons, rehabilitation and sentencing, will revive concerns about the widespread availability of mobiles in prison. Some are smuggled in, others are thrown over the wall.

Lord Justice Hughes said that although jamming equipment would be "hugely expensive" it should be installed. "I don't believe that it is not possible if you spend enough money to have a system where you can jam mobile phones," he said. "It is mobile phones and drugs which are the currency of prisons and which allow the seriously malign to take over and run prisons."

The Government has said one problem with the idea is that it might affect phones outside prisons.

A report by Wandsworth prison's independent monitoring board in 2008 said that the

estimated £1million drug trade inside the jail would be halved if mobile phone use was stopped.

Jailed south London gangster Delphon Nicholas used a mobile phone to arrange the fatal shooting of his former childhood friend Andrew Wanoghu. His Old Bailey trial in 2008 heard how mobile phone records showed Nicholas repeatedly speaking to a hitman. Nicholas, who was 29 at the time, and the killer, Trevor Dennie, 33, were jailed for life.

Description: *Scanners Due to High Radiation Levels*

TheUnhivedMind - April 10, 2011 02:23 AM (GMT)

Medical Doctors Are Avoiding Airport Naked Body Scanners Due to High Radiation Levels

Sunday, April 3, 2011
http://bungalowbillscw.blogspot.com/2011/0...ng-airport.html

The radiation controversy surrounding airport naked body scanners continues to build. CNN's Elizabeth Cohen conducted a small-scale investigation to get some medical advice from doctors. The doctors concerns are not just about the radiation levels emitted by the naked body scanners, but by the repeated procedure some travelers are subjected to.

“I do whatever I can to avoid the scanner. This is a total body scan — not a dental or chest X-ray,” said Dr. Len Lichtenfield to Cohen in an email. “Total body radiation is not something I find very comforting based on my medical knowledge.”

Another doctor explained that there is “no absolutely safe dose of radiation,” and that “each exposure is additive.” So even if the supposedly low radiation doses emitted from the naked body scanners are as low as TSA and the machines’ manufacturers claim they are, habitual exposure will still cause bodily harm.

Here's an observation I have. Having served in the Army and trained to save, I was taught how to take X-rays at Fort Sam Houston, Texas. The federal government through the US Army was vigilant in ensuring soldiers who took x-rays weren't overexposed with radiation. It was the only time in my professional career both working in a clinic and as a sales rep in digital x-ray that I wore a film badge, which measures exposure. The federal government doesn't seem nearly as concerned these days when it comes to exposure from naked body scanners.

Raised cancer risk for children as soaring numbers are subjected to radioactive CT scans

By Daily Mail Reporter
Last updated at 11:28 AM on 5th April 2011
http://www.dailymail.co.uk/news/article-13...e-CT-scans.html

Children could be at risk of cancer in the U.S. after figures show soaring numbers of youngsters are getting CT scans and could be exposed to adult-sized radiation doses.

The number of children having scans in emergency rooms has rocketed from 330,000 in 1995 to 1.65million in 2008 - a five-fold increase - a new study has found.

Experts said the increases may be down to improvements in CT scan technology which mean they can be turned around quickly and clear images produced.

However, they also said the rise may be down to fear among medical professionals of legal action if they make an incorrect diagnosis.

A CT scan on BBC drama Holby City. The number of children having CT scans in the U. S. has increased five-fold in 13 years

Dr David Larson, of Cincinnati Children's Hospital Medical Centre, who led the research, said: 'If you send a kid home (without a CT scan) and it turns out you missed an abnormality, not many juries are going to be sympathetic.'

CT scans are most commonly used for children with head injuries, headaches and abdominal pain.

Researchers said the findings underlined the need to make sure the imaging is 'appropriately ordered, performed and interpreted.'

The number of visits by children to emergency rooms did not increase measurably during the study, but the percentage of visits involving CT scans climbed from about 1 per cent to almost six per cent.

Increases occurred at children's hospitals but also at general hospitals, where most youngsters are treated, and which raises concerns some may have received adult-sized doses of radiation.

The study did not include figures on dose information, but general hospitals may be less likely than paediatric facilities to use special CT protocols with children to limit their radiation exposure, the study authors said.

Experts say the rise in the number of scans among children in the U.S. could be down to improved technology and fear of being sued if a diagnosis is wrong

Increases in CT scan use have also been found in adults, generating increasing awareness about overuse and potential harm because radiation exposure can cause later cancers.

Children's CT scans need close attention so the dose size can be adjusted as they are more sensitive to radiation than adults and their age means there is more time for radiation related cancers to develop.

Dr Larson said it was impossible to tell from the data whether X-rays, which use less radiation, or other tests could have been done instead of CT scans.

Dr Marta Hernanz-Schulman, a paediatric radiologist at Vanderbilt University Medical Centre who campaigns to raise awareness about ways to reduce children's exposure to medical radiation, said the study trends 'are very believable' and illustrate the need to make sure imaging scans aren't used inappropriately in children.

Dr Larson said there are signs CT scan use in kids may have started decreasing since the study ended.

Dr Steven Krug, emergency department chief at Chicago's Children's Memorial Hospital, said many institutions including his own have started using ultrasound to diagnose appendicitis in some kids with abdominal pain. Ultrasound images are not as detailed as CT images, and children with uncertain results will still need CT scans, but he said the trend may help limit radiation exposure.

Dr Mike Swindle from the Carle Foundation Hospital in Urbana, Ill.,said about 20

percent of the emergency room patients were children.

Procedures call for adjusting CT scan radiation doses to children's size and weight, he said, adding: 'We've all become a bit more conservative with ordering' CT scans. Parents, too, are becoming more aware and increasingly asking about the risks, instead of demanding a CT scan for every bump on the head.'

Researchers used annual government surveys on ER visits at non-federal hospitals nationwide, focusing on visits in patients younger than 18.

The findings were published in the journal Radiology.

Mobile-Phone Use May Affect Brain Activity, Researchers Find

By Nicole Ostrow - Feb 22, 2011 9:00 PM GMT+0000
http://www.bloomberg.com/news/2011-02-22/m...ar-antenna.html

Using a mobile phone for 50 minutes stirs brain metabolism, although the health consequences are unknown and need to be studied further, U.S. researchers said.

When mobile phones were on and held against the ear, brain glucose metabolism, a marker of brain cell activity, was about 7 percent higher in areas closest to the antenna than when phones were off, a study in today's Journal of the American Medical Association found. The study, the first to show the effects of mobile-phone use on brain metabolism, was done by researchers from the National Institutes of Health in Bethesda, Maryland, and Brookhaven National Laboratory in Upton, New York.

Studies, including a report last year from the World Health Organization's International Agency for Research on Cancer, have produced conflicting results over the health dangers of mobile phones, particularly their link to cancer. Today's finding shows that human brain metabolism is sensitive to the effects of radiofrequency-electromagnetic fields, a form of radiation, from mobile phones.

"We need to investigate this carefully so that we can send a clear-cut message that is as unequivocal as possible," said Nora Volkow, director of the National Institutes of Health's National Institute on Drug Abuse, in a Feb. 18 telephone interview. "We don't know the clinical significance. In principle, increasing brain glucose metabolism is not a bad thing. You don't need to stop using your cell phones. If you are concerned, use a wire ear piece or use your speaker phone mode."

There were almost 293 million wireless accounts in the U.S. as of June 2010, according to CTIA-The Wireless Association, a Washington-based trade group that represents carriers, phone makers and suppliers. The number of U.S. households that only have wireless phones was about 25 percent, the group said.

Industry Response

“The peer-reviewed scientific evidence has overwhelmingly indicated that wireless devices, within the limits established by the FCC, do not pose a public health risk or cause any adverse health effects,” John Walls, vice president of public affairs for CTIA, said in a Feb. 18 e-mail. “The leading global health organizations such as the American Cancer Society, National Cancer Institute, World Health Organization and the U.S. Food and Drug Administration all have concurred that wireless devices are not a public health risk.”

The researchers from the National Institutes of Health and Brookhaven National Laboratory included 47 people in the study. They placed mobile phones on the right and left ears of participants and then measured brain glucose metabolism once when the phone on the right side was on but muted for 50 minutes and a second time when both cell phones were off. After 50 minutes, the patients had their brain activity measured using a positron emission tomography, or PET, scan.

Affected Brain Regions

Researchers found that only the regions closest to the antenna, the orbitofrontal cortex and the temporal pole, saw a rise in brain metabolism when the mobile phone was on. The orbitofrontal cortex plays a role in decision making and reward and punishment, and the temporal pole is involved in social and emotional processes.

Henry Lai, who wrote an accompanying editorial in the journal with Lennart Hardell from University Hospital in Orebro, Sweden, said the results of today’s study add to information about the possible effects of emissions from wireless phones on the brain.

“It is an intriguing discovery and it certainly adds to the concern that cell phone use is not completely safe,” said Lai, a bioengineering researcher at the University of Washington in Seattle, in a Feb. 20 e-mail. “Before we understand the impact of the results of this study, people who use cell phones should limit their exposure to the radiation, particularly to the head.”

TheUnhivedMind - February 13, 2011 02:58 AM (GMT)

How clever cubes tiny enough to hold in your hand could spell the end for ugly mobile phone masts

Last updated at 11:19 PM on 12th February 2011
Comments (0)
http://www.dailymail.co.uk/news/article-13...hone-masts.html

Ugly mobile phone masts which blight the landscape could soon disappear forever, replaced by tiny cubes which you can hold in your hand.

The pioneering technology could also create a seamless wireless network and eliminate internet 'black spots'.

Designers at Bell Labs, New Jersey have developed a tiny antenna which transmits signals without the need for huge unsightly towers.

Hand-held revolution: Wim Sweldens, president of Alcatel-Lucent's wireless division, demonstrates the lightRadio cube, a tiny mobile phone antenna which could replace unsightly masts

The 'lightRadio cube' is the size of a Rubik's cube - vastly smaller than the ironing-board-sized antennas found on mobile phone masts.

These tiny devices could be attached to lampposts, buildings or telephone poles as single cubes or in clusters, connected to the mobile phone network with optical fibres.

The lightRadio cube, developed by French-U.S. communications giant Alcatel-Lucent at Bell Labs in New Jersey, is to go on show at the Mobile World Congress in Barcelona from Monday.

Wim Sweldens, president of the firm's wireless division, said: 'We see more and more towers that become bigger and bigger, with more and bigger antennas that come to obstruct our view and clutter our landscape and are simply ugly.

'What we have realised is that we, as one of the major mobile equipment vendors, are partially if not mostly to blame for this.'

He said the new 'small-cell' technology could make mobile phone masts 'go away'.

The firm will begin trials of the cube with mobile phone firms in September. It hopes to make it commercially available next year.

Bell Labs developed some of the industry's most important innovations, including the touch-tone telephone, the laser - and even the very concept of a cellular network.

Their latest invention could revolutionise the wireless industry, increasing data speeds and reducing the number of 'black spots' with poor wireless signal.

Rather than connecting all phones within a mile or two to the same mast, mobile phone companies could instead divide traffic between several smaller cells.

This would allow for a far greater capacity for calls and data - crucial at a time when smartphone users are saturating the network with data requests.

AT&T has already started creating a network of outdoor Wi-Fi hotspots in New York to cope with the number of iPhone users who are using the mobile network to access the internet.

Rasmus Hellberg, of San Diego-based wireless firm Qualcomm, said the small-cell technology could increase a network's capacity tenfold.

The firm will also be at the Barcelona event - the biggest mobile phone trade show in the world - to demonstrate how 'heterogeneous networks', which combine large and small cells, can work.

But manufacturers need to work out how to reduce radio interference between the two cells before these new networks can become a reality.

TheUnhivedMind - January 26, 2011 04:26 PM (GMT)

O2 plans UK-wide wi-fi network

Wi-fi networks are springing up all around the UK

26 January 2011 Last updated at 11:27
http://www.bbc.co.uk/news/technology-12285558

Mobile operator O2 is launching free wireless in the UK, which it promises will be double the size of existing networks by 2013.

Initially the hotspots will be available in 450 O2-owned sites but will be expanded to other locations, including shops and restaurants.

Previously O2 had offered free wi-fi on some of its tariffs via BT Openzone and The Cloud.

The Cloud is rumoured to be close to sealing a buy-out deal with Sky.
Premium

O2 said access to the hotspots would be through a simple sign-up process and would be free to both O2 and non-O2 customers.

For Jeremy Green, a principal analyst with Ovum, the move is a "step in the right direction" to sorting out O2's capacity issues, brought about by high iPhone ownership and the increasing desire for data on the move.

"450 sites is not fantastic coverage and wi-fi isn't something that smartphone users will be able to rely on but it is a gesture in the right direction," he said.

He said it was "surprising" that O2 was prepared to offer it free to non-customers,

something the firm is hoping to fund via advertising.

In a swipe at BT's Fon network, which offers connections which piggyback on BT home broadband networks, O2 said that its service would offer "premium public hotspots, as opposed to using residential connections with limited bandwidth".

BT's Openzone and Fon networks are currently the biggest networks in the UK.

The second largest The Cloud claims to have around 22,000 hotspots internationally.

BT recently launched an iPad app allowing its broadband customers to gain access to wi-fi hotspots around the country.

It already has Android and iPhone apps, which has proved popular, attracting 400,000 downloads.

Rival Virgin Media is also toying with the idea of creating a nationwide wi-fi network.
Years away

O2 wants to help kick-start more wi-fi usage.

"Only 20% of people who have access to free public wi-fi on 02 tariffs actively use it despite the majority of devices being wi-fi enabled," said O2's business development director Tim Sefton

"We know that wi-fi as a technology has great potential and can be a very fast service, however customers are discouraged by barriers which include complexity in activation, uncertainty of where wi-fi is free and the variable quality of the current experience," he added.

Mr Green said that O2's wi-fi network would have to go hand-in-hand with other network upgrades.

O2 said that it is continuing to invest in its existing network but Mr Sefton confessed to UK technology news site TechRadar that it would be "years rather than months before we'll have a commercial 4G network".

PHONE CHARGER LINK TO FIRE THAT KILLED 3 CHILDREN

Samantha Hudson was left fighting for her life

Friday December 31,2010
By Mark Blacklock
http://express.co.uk/posts/view/220286/Pho...lled-3-children

A HOUSE fire in which three children died may have been started by a mobile phone charger, it was claimed yesterday.

Safety experts have warned of the dangers of leaving the devices plugged in and switched on.

Samantha Hudson was left fighting for her life after being found unconscious in her blazing home with her children William, nine, AJ, five, and three-year-old Maddie in her arms.

All four were pulled from the flames on November 11 but only Miss Hudson, 27, survived and remains largely unresponsive in hospital and is not aware that her children are dead.

Yesterday, her brother Peter Hudson, 30, said investigators believe an electrical device may be to blame

He said: “The focus of the investigation has been on something that was plugged in. It looks like it could have been a phone charger.”

Royal Society for the Prevention of Accidents spokeswoman Jo Bullock said the tragedy is a reminder that appliances need to be switched off when not in use. She said: “This is a sad case that highlights the need to be careful about what you leave on overnight.

“People should also ensure they do not overload sockets and check their smoke detectors are working.”

The fire broke out in the living room of the home in Bridlington, East Yorkshire. Miss Hudson grabbed Maddie and went to the boys’ bedroom when she heard the smoke alarm. Mr Hudson said: “She was found with all the kids round her. They were all unconscious. She probably won’t remember what happened, which might be a good thing.”

Doctors at Scarborough District General Hospital fear Miss Hudson could be permanently brain damaged from smoke inhalation.

Mr Hudson said: “She is like a stroke victim. She can’t move her arms or legs or talk or understand anything. Sometimes, she will make eye contact with us or squeeze our hands, but that’s it.”

A spokesman for Humberside Fire and Rescue Service said: “At this stage it is not possible to speculate what the cause may have been”.

Description: *guise of cell phone coverage*

TheUnhivedMind - December 27, 2010 05:10 PM (GMT)

Channel Tunnel to get mobile phone coverage in time for London 2012 Olympics

British and French telecoms operators are close to signing an entente cordiale to bring mobile phone coverage to the Channel Tunnel in time for the London 2012 Olympics, The Daily Telegraph has learned.

By Rupert Neate 5:45AM GMT 27 Dec 2010
http://www.telegraph.co.uk/finance/london-...2-Olympics.html

It is understood that Britain's four mobile operators – Vodafone, O2, Everything Everywhere and 3 – have joined forces with their counterparts in France to share the expected £20m cost of providing mobile coverage along the tunnel's entire 31.4 mile length.

British operators will share the cost of providing coverage in the Dover to Calais tunnel, with France's Orange, SFR and Bouygues splitting the cost of installing the system in the Calais to Dover tunnel.

Alcatel-Lucent, the French telecoms infrastructure company, has been contracted to install the technology.

Ofcom, the UK telecoms regulator, confirmed that it is preparing to issue spectrum licences to allow French and British operators to share airwaves inside the tunnel.

It is understood that Vodafone is spearheading the ambitious Channel Tunnel project on the British side of the Channel. However, a Vodafone spokesman refused to comment.

As The Sunday Telegraph reported earlier this year, Boris Johnson, the Mayor of London, played a key role in speeding up the project, which has been talked about for years.

Mr Johnson also took it upon himself to "bash heads together in the mobile phone industry" to bring 2G and 3G coverage to the London Underground in advance of the 2012 Olympics.

Mobile operators have agreed to collectively invest £150m in bringing the mobile network to virtually all of the city's Tube tunnels. French technology company Thales is the preferred bidder to install the technology, which is likely to be managed by Huawei, a Chinese telecoms company.

Coverage is likely to be provided by a very long transmitter snaking along the top of the tunnel, with antennas on the ends of each carriage. Similar "leaky feeder" technology was used to establish communications between the trapped Chilean miners and their rescuers. Passengers will be able to make voice calls and browse the internet over the 3G network.

http://www.khou.com/news/Texas-man-injured...-111260239.html

CEDAR HILL, Texas — A North Texas man talking on his cell phone was rushed to a hospital after his phone apparently exploded Thursday morning.

Aron Embry was at Ray Elementary in Cedar Hill at the time of the incident. The man said he had just finished a call when he said he heard a loud "pop."

He then felt something trickling down his face; it was blood.

His ear then began to bleed profusely, and he was immediately taken to the emergency room at Parkland Memorial Hospital in Dallas. He received four stitches, but said there was no hearing loss.

The glass on the face of the Motorola Droid smartphone apparently shattered. He said he had just purchased it just two days ago.

"Once I got to the mirror and saw it, it was only then I kind of looked at my phone and realized that the screen had appeared to burst outward," he said.

The phone still appears to be functioning, and its battery was intact.

Family members said they plan to contact the manufacturer of the phone and Verizon about the incident.

On Thursday evening, Motorola issued this statement:

"Motorola's priority is, and always has been the safety of our customers, and all Motorola products are designed, manufactured and tested to meet or exceed international and local standards for consumer safety. We will reach out to the consumer and investigate this thoroughly."

While an exploding phone is rare, it is not unique.

Just a few months ago, a 23-year-old man died after his phone exploded in North India.

Most reports of exploding phones happen when they are in charging mode, which was the case in China. The phone of a 27-year-old housewife exploded while she was talking to her husband as the phone was being charged. She too was killed.

There was another incident reported in Wyoming a few years ago. A 19-year-old co-ed suffered second to third-degree burns while sleeping. Her phone had been charging near her when it caught fire. She was injured while trying to extinguish the fire.

It was in direct response to the Wyoming case that the U.S. Consumer Product Safety Commission issued warnings for cell phone users. Among tips released by the CPSC were making sure your cell phone is compatible with your battery. Also, it warned users to keep batteries away from metal objects while phones are not in use. Phones should also be kept away from liquids and users should be careful that they do not overheat.

TheUnhivedMind - December 4, 2010 01:02 AM (GMT)

Mobile Phone EMF Radiation

http://scalar-resources.com/products-mobil...-radiation.html

Mobile phone radiation and health concerns have been raised, especially following the enormous increase in the use of wireless mobile telephony throughout the world (as of August 2005, there were more than 2 billion users worldwide). Mobile phones use electromagnetic radiation in the microwave range, and some believe this may be harmful to human health. These concerns have induced a large body of research (both epidemiological and experimental, in non-human animals and in humans).

Part of the radio waves or radiation emitted by a mobile phone is absorbed by the human head. The radio waves emitted by a GSM handset, can have a peak power of 2 watts, and a US analogue phone had a maximum transmit power of 3.6 watts. Other digital mobile technologies, such as CDMA2000 and D-AMPS, use lower output power, typically below 1 watt. The maximum power output from a mobile phone is regulated by the mobile phone standard it is following and by the regulatory agencies in each country. In most systems the mobile phone and the base station check reception quality and signal strength and the power level is increased or decreased automatically, within a certain span, to accommodate for different situations such as inside or outside of buildings and vehicles. The rate at which radiation is absorbed by the human body is measured by the Specific Absorption Rate (SAR), and its maximum levels for modern handsets have been set by governmental regulating agencies in many countries. In the USA, the FCC has set a SAR limit of 1.6 W/kg, averaged over a volume of 1 gram of tissue, for the head. In Europe, the limit is 2 W/kg, averaged over a volume of 10 grams of tissue. SAR values are heavily dependent on the size of the averaging volume. Without information about the averaging volume used comparisons between different measurements can not be made. Thus, the European 10-gram ratings should be compared among themselves, and the American 1-gram ratings should only be compared among themselves. SAR data for specific mobile phones, along with other useful information, can be found directly on manufacturers' websites, as well as on third party web sites.

One well-understood effect of microwave radiation from mobile phones are dielectric heating, in which any dielectric material (such as living tissue) is heated by rotations of polar molecules induced by the electromagnetic field. In the case of a person using a cell phone, most of the heating effect will occur at the surface of the head, causing its temperature to increase by a fraction of a degree. In this case, the level of temperature increase is an order of magnitude less than that obtained during the exposure of the head to direct sunlight. The brain's blood circulation is capable of disposing of excess heat by increasing local blood flow. However, the cornea of the eye does not have this temperature regulation mechanism and exposure of 2-3 hours' duration has been reported to produce cataracts in rabbits' eyes at SAR values from 100-140W/kg.

Is Wi-Fi frying our brains? Fears that cloud of 'electrosmog' could be harming humans

By Alasdair Philips
Last updated at 8:55 AM on 30th November 2010
http://www.dailymail.co.uk/sciencetech/art...arm-humans.html

As winter arrives with a vengeance, the last of this year's glorious autumn leaves are falling in our parks and woodlands.

But this week came worrying evidence that Mother Nature is not the only force denuding our trees of their foliage.

Research in the Netherlands suggested that outbreaks of bleeding bark and dying leaves which have blighted the country's urban trees may be caused by radiation from the Wi-Fi networks now so integral to life in offices, schools and homes.

As a qualified electronics engineer, I am not surprised by such findings. I have long been concerned about the harmful effects of the electro-magnetic radiation emitted not only by Wi-Fi devices but many other common modern gadgets, including mobile and cordless phones, wireless games consoles and microwave ovens.

Much though I love trees, and worrying though I find this research, what really unnerves me is the effect these electro-magnetic fields (or EMFs) are having on humans, surrounding us as they do with a constant cloud of 'electrosmog'.

I am no Luddite. When I started work in the 1960s, I was involved in building walkie-talkies. I thought they were just brilliant and that electronic technology would save the world. But over the decades since, my scientific background has made it impossible for

me to ignore the overwhelming evidence about the damage wreaked by this electrosmog.

It is not the existence of these radio waves that is the problem so much as the use we make of them. Rather than being emitted at a constant rate, technology demands they are ‘pulsed’ in short and frequent bursts which appear to be far more biologically harmful.

Not the least is their impact on our ability to reproduce. It is well documented that average male sperm counts are falling by two per cent a year. Many causes have been suggested, from stressful lifestyles to poor diet and -hormones in our water supplies. But studies in infertility clinics show problems with sperm dying off or not moving properly are most common in men who use mobiles extensively. This has also been demonstrated in the laboratory.

Mobiles are not the only problem. Many laptops are now equipped with Wi-Fi which sends out pulses every second as it maintains contact with the nearest access point. Young men with these devices on their laps are submitting their testicles to strong EMFs at close range, oblivious to the damage they may be doing to their chances of future fatherhood.

EMFS have also been shown to affect the brain, suppressing production of melatonin, the hormone controlling whether we feel happy or sad. In 2004, researchers at the University of Malaga found that significant exposure to EMFs increases the chances of developing depression 40-fold.

They also linked electrosmog to headaches, irritability, unusual tiredness and sleeping disorders.

This has been confirmed in research by the respected Karolinska Institute in Sweden. Sponsored by the leading mobile phone companies, it showed that using handsets just before going to bed caused people to take longer to reach deeper stages of sleep. They also spent less time in each of these stages, so interfering with the body’s ability to repair damage suffered during the day.

This is particularly alarming given the tendency for teenagers and children to sleep with their mobile phones under the pillows so that they can answer late-night texts from friends.

Parents who allow their children to do so may be taking a significant gamble with their health.

This year saw the publication of the Interphone study carried out in 13 countries including the UK, and examining the links between mobile phone use and brain tumours. It suggested that those who had made heavy use of mobiles for a decade or

more faced twice the risk of glioma, the most common type of brain tumour.

And this was a study based on the period between 1994 and 2004 when ‘heavy’ usage was defined as two to three hours per month. A conservative estimate of average mobile phone use now is approximately half an hour a day, seven days a week.

Since brain tumours often develop very slowly it may be many years before the full impact of our reliance on mobiles becomes clear. But they are already implicated in another area of concern to health professionals, the onset of dementia in those under 65.

Experts are at a loss to explain the increase in this condition which has seen a surge in demand for pre-senile dementia units across the country. But can we really be surprised when a study at the Institute of Environmental Medicine in Sweden confirmed this month that exposure to EMFs significantly accelerates brain degeneration?

The risks posed by EMFs are recognised not only by scientists, but hard-headed commercial organisations. In 1997, the insurance company Swiss-Re identified EMFs as likely to cause the biggest increase in claims in years to come. Swiss-Re and other insurers have therefore refused to indemnify the mobile phone operators against health claims from their customers.

Even so, we should not hold out much hope of our politicians protecting us from EMFs. The mobile phone industry in the UK contributes around £20 billion in tax every year, so it’s hardly likely the Government will take action to reduce the number of calls. Indeed, it seems to be going in almost the opposite direction, encouraging the installation of Wi-Fi networks in our schools with tactics which sometimes verge on coercion. I’ve been told about a school which was threatened that it would receive no further government funding for computer technology if it did not install Wi-Fi.

Always on: Green Orb symbol for Wi-Fi

In the absence of official intervention, it’s down to all of us to protect ourselves. My aim as a campaigner is not to scare people but inform them about the risks, so they can choose to take precautions.

Not everyone will want to follow my example. Because of our concerns about electrosmog, my wife and I have moved to a cottage in Scotland out of range of any mobile phone network.

But there are small steps which we can all take. We should all try to use hands-free sets. And women should stop carrying mobiles in their bras (breast tissue being particularly susceptible to mobile phone microwaves), a trend which is becoming alarmingly fashionable.

We should also avoid cordless phones. Their base stations transmit 100 pulses a second, 24/7, even if you’re not using the phone, and at power levels equivalent to having a small mobile phone mast in your home.

You might also consider whether you really need wireless internet access in your home. One option is to buy dLAN adaptors which transmit the internet signal around the house by way of your ordinary electrical wiring.

Such changes will require small adjustments to our modern lifestyles. But until the evidence against EMFs is proven or disproven, these are surely sacrifices well worth making.

View Full Version: How Terahertz Waves Tear Apart DNA

Title: How Terahertz Waves Tear Apart DNA

TheUnhivedMind - November 27, 2010 05:16 AM (GMT)

How Terahertz Waves Tear Apart DNA

A new model of the way the THz waves interact with DNA explains how the damage is done and why evidence has been so hard to gather

kfc 10/30/2009
http://www.technologyreview.com/blog/arxiv/24331/

Great things are expected of terahertz waves, the radiation that fills the slot in the electromagnetic spectrum between microwaves and the infrared. Terahertz waves pass through non-conducting materials such as clothes , paper, wood and brick and so cameras sensitive to them can peer inside envelopes, into living rooms and "frisk" people at distance.

The way terahertz waves are absorbed and emitted can also be used to determine the chemical composition of a material. And even though they don't travel far inside the body, there is great hope that the waves can be used to spot tumours near the surface of the skin.

With all that potential, it's no wonder that research on terahertz waves has exploded in the last ten years or so.

But what of the health effects of terahertz waves? At first glance, it's easy to dismiss any notion that they can be damaging. Terahertz photons are not energetic enough to break chemical bonds or ionise atoms or molecules, the chief reasons why higher energy photons such as x-rays and UV rays are so bad for us. But could there be another mechanism at work?

The evidence that terahertz radiation damages biological systems is mixed. "Some studies reported significant genetic damage while others, although similar, showed none," say Boian Alexandrov at the Center for Nonlinear Studies at Los Alamos National Laboratory in New Mexico and a few buddies. Now these guys think they know why.

Alexandrov and co have created a model to investigate how THz fields interact with double-stranded DNA and what they've found is remarkable. They say that although the forces generated are tiny, resonant effects allow THz waves to unzip double-stranded DNA, creating bubbles in the double strand that could significantly interfere with processes such as gene expression and DNA replication. That's a jaw dropping conclusion.

And it also explains why the evidence has been so hard to garner. Ordinary resonant effects are not powerful enough to do do this kind of damage but nonlinear resonances can. These nonlinear instabilities are much less likely to form which explains why the character of THz genotoxic
effects are probabilistic rather than deterministic, say the team.

This should set the cat among the pigeons. Of course, terahertz waves are a natural part of environment, just like visible and infrared light. But a new generation of cameras are set to appear that not only record terahertz waves but also bombard us with them. And if our exposure is set to increase, the question that urgently needs answering is what level of terahertz exposure is safe.

Secretary of Transportation LaHood: We're looking into technology to disable cell phones in vehicles

Published on 11-20-2010 Email To Friend Print Version
http://dailycaller.com/2010/11/16/secretar...es-in-vehicles/

Transportation Secretary Ray LaHood said using a cell phone while driving is so dangerous that devices may soon be installed in cars to forcibly stop drivers — and potentially anyone else in the vehicle — from using them.

"There's a lot of technology out there now that can disable phones and we're looking at that," said LaHood on MSNBC. LaHood said the cellphone scramblers were one way, and also stressed the importance of "personal responsibility."

The hosts of Morning Joe pushed the secretary about the possibility of requiring scrambling technology installed in vehicles.

"I think it will be done," said LaHood. "I think the technology is there and I think you're going to see the technology become adaptable in automobiles to disable these cell phones. We need to do a lot more if were going to save lives."

LaHood's appearance coincided with the transportation department's launch of the "Faces of Distracted Driving," an online campaign aimed at scaring drivers safe. The awareness initiative features videos of people who have been injured by distracted drivers.

LaHood has called distracted driving an "epidemic" and the National Highway Traffic Safety Administration says about 5,000 people a year, or about .001 percent of the U.S.

population, die as a result of it. In 2009, however, the NHTSA found that highway fatalities were at the lowest levels since the 1950s. At the time, Lahood applauded the announcement but vowed he "would not rest" until the roads were even safer.

"Am I on a rampage," said LaHood, who has made distracted driving a top priority of his tenure, in February 2010. "Yes, I am, and why shouldn't I be?"

Lorry driver with 'God-awful hangover' guilty of crushing cyclist while talking on his mobile phone

By Daily Mail Reporter
Last updated at 2:00 AM on 19th November 2010
http://www.dailymail.co.uk/news/article-13...bile-phone.html

A lorry driver killed a cyclist while chatting on his mobile the morning after he had been on a mammoth drinks binge.

Dennis Putz – who had a string of convictions including three for drink-driving and 20 for driving while disqualified – hit Catriona Patel as he accelerated away from traffic lights.

A court heard he was over the drink-drive limit and had consumed almost a gallon of Guinness the night before the accident.

He was said to have been suffering from the ‘most God-awful hangover’.

City public relations director Mrs Patel, 39, was pronounced dead after being airlifted to hospital, where surgeon sbattled to save her life.

Putz, 51, claimed he did not realise he had run over the keen cyclist, who had been wearing high-visibility gear.

He only stopped when witnesses began hammering at his cab door following the morning rush-hour accident near Oval tube station in South London on June 29 last year.

Two witnesses at the scene told how they tried to comfort Mrs Patel, who was still conscious in the tangle of metal.

Putz admitted causing her death by careless driving and making a call on his mobile at the time of the accident but insisted he was using a hands-free kit.

He denied the more serious charge of causing death by dangerous driving but a jury yesterday found him guilty.

He was jailed for seven years and disqualified from driving for life.

Jonathan Polnay, prosecuting, said a forensic scientist had concluded that at the time of the crash, Putz's alcohol breath reading was likely to have been 49mg – nearly 50 per cent over the drink-drive limit of 35mg.

'Whilst this was an accident, we say this was an accident waiting to happen and an accident caused almost entirely by Mr Putz's dangerous driving,' he said.

The lorry driven by Putz which knocked the cyclist off her bike as she rode through rush-hour traffic

Mrs Patel, of Clapham, South London, was in training with her husband, Anish, to take part in the L'Etape du Tour where amateur cyclists follow a 107-mile mountainous route covered by Tour de France riders.

Mr Patel sobbed in the public gallery as the jury at Inner London Crown Court returned their unanimous verdict. Judge Roger Chapple said Putz had made an 'extraordinarily irresponsible' decision to climb into his cab.

He said he would have had 'the most God-awful hangover' and knew full well he should not have been driving.

Sentencing Putz, he said: 'Since your first disqualification 34 years ago you have shown a consistent disregard for road traffic laws. Prison sentences in the past have not persuaded you to mend your ways.

'Plainly you should never be allowed behind the wheel of an HGV again. The risk to the public is just too great.'

In a moving impact statement read to the court, Mrs Patel's husband and other family members described her as a 'happy, spontaneous, sensitive, thoughtful and deeply loyal person'.

He added: 'We have all been given the life sentence of living without our beloved Cat.'

Putz, of Barnet, North London, was previously jailed for six months in 1995 for reckless driving and again in 2003 for 16 instances of driving an HGV while disqualified.

Graduate killed in horror head-on car smash as she sent text message while driving

By Daily Mail Reporter
Last updated at 9:35 PM on 18th November 2010
http://www.dailymail.co.uk/news/article-13...ge-driving.html

A graduate was killed when she crashed her car after taking her eyes off the road to send a text message, an inquest has heard.

Tracy Wale was on her way to move into a flat with her partner when she collided with two cars on the A508, Northamptonshire in April.

The 22-year-old, who studied criminology and health at Northampton University, was also about to start a new job with Thames Valley Police.

She drove into the path of oncoming traffic when she collided head-on with first a Volkswagen Golf and then an Audi A6.

Tracy was described as "always full of vibrant energy and potential"

Tracy Wale was about to move into a new flat and start a job with Thames Valley police when the accident occurred. Evidence suggests that she was distracted by her mobile phone.

The driver of the Golf, a 29-year-old woman from Northampton, and the driver of the Audi a 31-year-old woman also from the Northampton area, both suffered minor injuries.

Tracy's family said they had been left devastated by her death.

They said: 'Tracy was a fun loving, caring daughter, who had everything to live for.

'On the day of the collision, Tracy was on her way to move into her new flat with her partner and start a job with Thames Valley Police in the control room.

'No words can describe how much Tracy will be missed by all her family and friends.

'Tracy was a much loved daughter, sister and friend to all that knew her.

'She was always full of such vibrant energy and potential and excelled at anything she turned her hand to.

'It was a terrible accident with terrible consequences and there is no getting away from using a mobile phone whilst driving can kill.

'If anything good can come out of the death of our daughter, we would urge people to switch off their phone before getting into a car.

'Nothing is so important that you cannot wait until you reach your destination or pull over and stop.

'The last few months have been the hardest thing that anyone could ever expect to deal with in a lifetime.'

An inquest at Northampton Coroners Court, heard police had found Tracy's mobile phone, set to text mode, inside her car after the crash.

PC Brian Johnson, investigating the crash said the evidence suggested Tracy had driven her Vauxhall Astra into the lane on the opposite side of the road and crashed into the two other cars.

Speaking at an inquest yesterday, he said: 'She may have been distracted by attempting to write a text message but there may have been some other reason.

'Her standard of driving fell below what would have been expected of a competent and careful driver.'

Recording a verdict of accidental death, Coroner Anne Pember said: 'It was an error on the part of Tracy.'

View Full Version: Should You Be Snuggling With Your Cellphone?

Title: Should You Be Snuggling With Your Cellphone?

TheUnhivedMind - November 18, 2010 01:20 AM (GMT)

Should You Be Snuggling With Your Cellphone?

By RANDALL STROSS
Published: November 13, 2010
http://www.nytimes.com/2010/11/14/business...l?_r=1&emc=eta1

WARNING: Holding a cellphone against your ear may be hazardous to your health. So may stuffing it in a pocket against your body.

I'm paraphrasing here. But the legal departments of cellphone manufacturers slip a warning about holding the phone against your head or body into the fine print of the little slip that you toss aside when unpacking your phone. Apple, for example, doesn't want iPhones to come closer than 5/8 of an inch; Research In Motion, BlackBerry's manufacturer, is still more cautious: keep a distance of about an inch.

The warnings may be missed by an awful lot of customers. The United States has 292 million wireless numbers in use, approaching one for every adult and child, according to C.T.I.A.-The Wireless Association, the cellphone industry's primary trade group. It says that as of June, about a quarter of domestic households were wireless-only.

If health issues arise from ordinary use of this hardware, it would affect not just many customers but also a huge industry. Our voice calls — we chat on our cellphones 2.26 trillion minutes annually, according to the C.T.I.A. — generate $109 billion for the wireless carriers.

The cellphone instructions-cum-warnings were brought to my attention by Devra Davis, an epidemiologist who has worked for the University of Pittsburgh and has published a book about cellphone radiation, "Disconnect." I had assumed that radiation specialists had long ago established that worries about low-energy radiation were unfounded. Her

book, however, surveys the scientific investigations and concludes that the question is not yet settled.

Brain cancer is a concern that Ms. Davis takes up. Over all, there has not been a general increase in its incidence since cellphones arrived. But the average masks an increase in brain cancer in the 20-to-29 age group and a drop for the older population.

“Most cancers have multiple causes,” she says, but she points to laboratory research that suggests mechanisms by which low-energy radiation could damage cells in ways that could possibly lead to cancer.

Children are more vulnerable to radiation than adults, Ms. Davis and other scientists point out. Radiation that penetrates only two inches into the brain of an adult will reach much deeper into the brains of children because their skulls are thinner and their brains contain more absorptive fluid. No field studies have been completed to date on cellphone radiation and children, she says.

Henry Lai, a research professor in the bioengineering department at the University of Washington, began laboratory radiation studies in 1980 and found that rats exposed to radiofrequency radiation had damaged brain DNA. He maintains a database that holds 400 scientific papers on possible biological effects of radiation from wireless communication. He found that 28 percent of studies with cellphone industry funding showed some sort of effect, while 67 percent of studies without such funding did so. “That’s not trivial,” he said.

The unit of measurement for radiofrequency exposure is called the specific absorption rate, or SAR. The Federal Communications Commission mandates that the SAR produced by phones be no more than 1.6 watts per kilogram. One study listed by Mr. Lai found effects like loss of memory in rats exposed to SAR values in the range of 0.0006 to 0.06 watts per kilogram. “I did not expect to see effects at low levels,” he said.

The city of San Francisco passed an ordinance this year that requires cellphone retailers to post SARs prominently. This angered the C.T.I.A., which announced that it would no longer schedule trade shows in the city.

The association maintains that all F.C.C.-approved phones are perfectly safe. John Walls, the association’s vice president for public affairs, said: “What science tells us is, ‘If the sign on the highway says safe clearance is 12 feet,’ it doesn’t matter if your vehicle is 4 feet, 6 feet or 10 feet tall; you’re going to pass through safely. The same theory applies to SAR values and wireless devices.”

The association has set up a separate Web site, cellphonehealthfacts.com. Four attractive young people are seen on the home page, each with a cellphone pressed against the ear — and all four are beaming as they listen. By this visual evidence,

cellphone use seems to be correlated with elation, not cancer.

The largest study of cellphone use and brain cancer has been the Interphone International Case-Control Study, in which researchers in 13 developed countries (but not the United States) participated. It interviewed brain cancer patients, 30 to 59 years old, from 2000 to 2004, then cobbled together a control group of people who had not regularly used a cellphone.

The study concluded that using a cellphone seemed to decrease the risk of brain tumors, which the authors acknowledged was “implausible” and a product of the study’s methodological shortcomings.

The authors included some disturbing data in an appendix available only online. These showed that subjects who used a cellphone 10 or more years doubled the risk of developing brain gliomas, a type of tumor.

The 737 minutes that we talk on cellphones monthly, on average, according to the C.T.I. A., makes today’s typical user indistinguishable from the heavy user of 10 years ago. Ms. Davis recommends keeping a phone out of close proximity to the head or body, by using wired headsets or the phone’s speaker. Children should text rather than call, she said, and pregnant women should keep phones away from the abdomen.

The F.C.C. concurs about the best way to avoid exposure. It is not by choosing a phone with a marginally lower SAR, it says, but rather by holding the cellphone “away from the head or body.”

It’s advice that I find hard to put into practice myself. The comforting sight of everyone around me with phones pressed against their ears, just like me, makes the risk seem abstract.

But Ms. Davis, citing unsettling findings from research in Israel, France, Sweden and Finland, said, “I do think I’m looking at an epidemic in slow motion.”

Randall Stross is an author based in Silicon Valley and a professor of business at San Jose State University. E-mail: stross@nytimes.com.

TheUnhivedMind - November 10, 2010 03:03 AM (GMT)

TEXT-MAD TEENS ARE ‘MORE LIKELY TO HAVE HAD SEX’

Parents should beware the dangers of ‘heavy texting’ by teenagers

Wednesday November 10,2010
By Tom Morgan
http://www.express.co.uk/posts/view/210609...o-have-had-sex-

TEENAGERS who send the most text messages are the ones most likely to have had sex and tried drugs and alcohol, researchers warned yesterday.

Those who send more than 120 text messages a day are three-and-a-half times more likely to have had sex than those less addicted to their mobiles.

They are 90 per cent more likely to have had four or more sexual partners. The so-called hyper-texting teenagers are also more likely to have tried cigarettes, alcohol and illicit drugs.

Researchers in Cleveland, Ohio, who surveyed more than 4,200 students at 20 high schools, found that one teenager in five was a hyper-texter.

They also found that one teenager in 10 was a hyper-networker, who spent more than three hours per school day on social networking websites such as Facebook. This group was more likely to suffer from stress, depression and poor sleep. Hyper-networkers were also more prone to suicide, drug use and fighting.

Similar to hyper-texters, the group was more likely to have tried cigarettes and alcohol and engaged in binge drinking. They were not as likely to have had sex as hyper-

texters – but were still more likely to have done so than teenagers who were neither heavy texters nor heavy networkers.

Dr Scott Frank, who led the study, said: "The startling results suggest that when left unchecked texting and other widely popular methods of staying connected can have dangerous health effects on teenagers. This should be a wake-up call for parents to not only help their children stay safe by not texting and driving, but by discouraging excessive use of the cell phone or social websites in general.

"If parents are monitoring their kids' texting and social networking, they're probably monitoring other activities as well." Dr Frank, an associate professor of epidemiology and biostatistics at Case Western Reserve University School of Medicine, presented his findings to the American Public Health Association in Denver.

Cell tower radiation harmful to humans: study

Multiple radio signals enough to cause physical and psychological problems
Last Updated: Friday, November 5, 2010 | 4:30 PM ET
CBC News
A research report published in the Canadian journal Environmental Reviews draws some disturbing conclusions about the amount of radiation people are absorbing from cellphone towers and its effects on human health.

Cellphone towers have become part of the landscape, but a new report says the radiation coming from them poses a threat to human health. (Dick Whipple/Associated Press)"The bottom line is that these very chronic low-level intensities are not biologically inert," study author Blake Levitt told CBC News.

Levitt, a medical and science journalist has been studying radio frequency exposures since the 1970s, and has written two books on the subject.

She says the exponential growth of wireless use and the accompanying low-level signals are a concern. The paper notes there are now 5.5 billion cellphones in use worldwide. In addition to the cell signals, there are also Wi-Fi networks and Wi-Max, which began rolling out in the U.S. last year and uses lower frequencies with higher power densities.

Similar to cold war embassy bombardment
The results, according to Levitt, are conditions similar to the intentional irradiation of employees at the U.S. Embassy in Moscow starting in 1953 during the Cold War.

"We're getting a mirror effect now, because the exposures close to cell towers now are almost identical in frequency, in signalling characteristics and in long-term low-level chronic exposure duration as that early microwave sickness paper from the irradiation of the Moscow embassy."

In 1978, researchers at Johns Hopkins University published a study on the long-term effects of that radiation exposure and found it led to several serious health problems. Among them: eczema, psoriasis, allergic and inflammatory reactions, neurological and reproductive problems, tumours and mood disorders such as depression, irritability and lack of concentration.

Levitt says these symptoms have been reflected in other studies on long-term exposure and have been seen in real-world practice.

"It is being increasingly reported when anyone looks at the symptoms that are being reported in populations that live near cell towers or low-level infrastructure."

The medical and scientific community is very much at odds over the impact of cellphone radiation. Health Canada maintains there is no problem.

"Health Canada has reviewed this article and has noted that no new data is presented," the department said in a statement to CBC News. "As well, the conclusions made by the authors are not based on a full examination of the scientific evidence."

Many of the studies cited in the article claim biological or harmful health effects may occur at radiofrequency levels below Health Canada's exposure limits.

"As long as exposures respect the limits set in Health Canada's guidelines, the department has no scientific reason to consider exposure to low-level radiofrequency fields, such as those from cell towers, dangerous to the public," the statement added.

Environmental Reviews is published by Canadian Science Publishing. Before it became private in September, the online publication was overseen by the National Research Council.

TheUnhivedMind - November 5, 2010 07:04 PM (GMT)

Who says men can't multi-task? Driver caught on video reading a book, using a Kindle AND answering his phone... at 60mph

By Daily Mail Reporter
Last updated at 4:13 PM on 5th November 2010
http://www.dailymail.co.uk/news/article-13...one--60mph.html

The old adage suggests that women, not men, are the only ones who can multi-task. Well this man seems determined to disprove that theory.

Here is footage of him driving on the motorway at 60mph while reading a book, studying an Amazon Kindle AND answering his mobile phone.

The car of men in the next lane on the motorway - believed to be in America - to the van driver take footage of his crazy multi-tasking.

First they spot him reading a book, which is lodged between the dashboard and the steering wheel.

Then he pulls out a Kindle - an electronic devise used for reading.

And, to top it all off, he takes a call on his phone - a sight that leads the filmers to burst in to uproarious laughter.

Driving while using one's mobile phone is illegal in some U.S. states.

It's unclear whether there is a law on driving while reading a Kindle or not...

TheUnhivedMind - October 30, 2010 05:41 PM (GMT)

Tweet Everest: Mountaineers get 3G access at 17,000ft thanks to new mobile phone towers

By Daily Mail Reporter
Last updated at 4:09 PM on 30th October 2010
http://www.dailymail.co.uk/sciencetech/art...one-towers.html

You can't get away from a mobile phone call, even at the top of the world.

Thanks to 3G towers newly installed near Mount Everest's base camp, explorers can surf the Web, tweet and post Facebook updates without worrying that their signals will disappear into thin air.

The new high-speed service, announced yesterday by Ncell, will allow mountaineers setting off to the summit of the world's tallest mountain to access wireless Internet and make video calls to family, friends and supporters.

'You know, I think it's kind of good and kind of bad, but to me it's kind of inevitable,' said renowned climber Ed Viesturs, frequently described as the strongest U.S. high-altitude mountaineer.

The 51-year-old veteran of seven climbs to Everest's 29,035-foot (8,850-metre) summit said the new technology is not for him.

'I'm kind of old school,' said Viesturs, who has climbed all 14 of the world's highest peaks.

'But you can imagine the newer generation saying, 'No, bring it on. The more the better.'

Every year, thousands of trekkers from all over the world walk to Everest's base camp

at 17,000 feet (5,182 metres), and hundreds of mountaineers take on the arduous and dangerous route to the summit.

Until now, they were forced to carry heavy - and expensive - satellite equipment to transmit information and images from base camp.

On the climb, mountaineers carry handheld VHF radios to talk with base camp, though an expedition might also carry a satellite phone to contact sponsors and family.

For 25-year-old Leif Whittaker, who summited Everest for the first time in May - calling his mother on the descent, using a satellite phone - the advantage comes down to being able to easily phone home.

'Just being able to communicate with your family and friends would make it a lot easier to spend two months in a tent away from home,' said Whittaker, whose father, Jim Whittaker, was the first American to summit Everest.

But there is a risk that it could be a dangerous distraction, the Port Townsend, Washington, resident said. When attempting the summit, 'you need to stay focused in the moment.'

Dave Hahn, who has climbed Everest 12 times, more than any other American, noted that the north side base camp in Tibet has had cell service for several years, but not the south side in Nepal.

The 48-year-old from Taos, New Mexico, said that when he first climbed Everest in 1991, he had equipment that allowed him to transmit lines of Telex. 'That was pretty high-tech in 1991.'

And in 1999, when Hahn was on the expedition that found the body of legendary English mountaineer George Mallory, who died on Everest in 1924: 'I remember sitting up all night figuring out how to send the photos out in big enough resolution.'

That will be a thing of the past now. But might Facebook, Twitter and the high-pitched sound of dozens of cell phones ringing cheapen the experience?

'I hear that all the time,' Hahn said. 'And what can you say? Things change that way. And those of us who've beamed home pictures and stories from the place, well, we've accelerated that change.'

Gordon Janow, who helps set up base camps for expeditions led by Alpine Ascents International of Seattle, agreed.

Trekkers in the lower elevations of the Himalayas also use cell phones, and 'I don't know if it's good or bad,' he said. 'It was one of the few places you could go and lose

yourself from the world.'

Study: Laptops with WiFi can cause sperm damage

by Dan Boniface
28 Oct 2010
http://www.9news.com/news/article.aspx?sto...60158&catid=339

DENVER - As little as four hours of exposure to laptops with WiFi can damage sperm, according to a recent study by the American Society for Reproduction in Denver.

"This is the first scientific study showing that a laptop computer connected by WiFi may damage DNA and decrease sperm motility," Conrado Avendano, Research Director at the Nascentis Reproductive Medical Center in Argentina, stated in a news release Wednesday.

Avendano says if men are trying to have children, they should not work with a WiFi-enabled laptop near their lap, or should instead connect to the Internet using cables.

The issue, Avendano says, is the microwave radiation.

According to the group that did the study, a previous study on cell phones revealed that microwave radiation can decrease sperm quality. That led scientists to advise men to avoid carrying cell phones in their pants.

New Book Looks at Connection Between Mobile Devices and a Host of Health Problems

Published on 10-12-2010 Email To Friend Print Version
http://cryptogon.com/?p=18182

Is this partially why so many men are shooting blanks?

And what is the compelling evidence to suggest that cellphones might be tied to sterility in men?

In 2008, researchers found that men with the lowest sperm counts were significantly more likely to keep their phones on their bodies all the time. And it's been found that the sperm exposed to the highest level of radiation from the phone were the most deformed and the worst swimmers. An Australian team led by a fellow named John Aitkin believes that cellphone radiation weakens the ability of the sperm cell to swim because it's affecting mitochondrial DNA (mitochondria are basically the engines of the cell). Very similar work was done at one of the top research institutions in Turkey, and in Poland, Hungary and India.

Disconnect: The Truth About Cell Phone Radiation, What the Industry Has Done to Hide It, and How to Protect Your Family by Devra Davis
http://www.amazon.com/exec/obidos/ASIN/052...cryptogoncom-20

Via: Salon:
http://www.salon.com/books/feature/2010/10...view/index.html

Strange how hard it is to remember a time before cellphones. Mobile phones have changed the way we spend our leisure time, the way we work and how we consume

everything from groceries to news stories. Some countries even set up centers to treat those “addicted” to iPhones or BlackBerrys. But, as a new book shows, cellphones may actually be doing damage to far more than our attention spans — and could, in fact, be killing us.

In “Disconnect,” Devra Davis, a scientist and National Book Award finalist for “When Smoke Ran Like Water,” looks at the connection between cellphones and health problems, with some disturbing results. Recent studies have tied cellphone use to rises in brain damage, cheek cancer and malfunctioning sperm. She reveals the unsettling fact that many new cellphones now come with the small-print warning that they are to be kept at least one-inch from the ear (presumably for safety reasons) and many insurance companies refuse to insure cellphone companies against health-related claims. Most troubling of all, science has shown that children and teenagers are particularly susceptible to cellphone radiation, raising questions about its effects on coming generations.

Salon spoke to Davis, via land line, about the real dangers of cellphone use, the industry’s coverup and what we can do to protect ourselves and our children.

View Full Version: Texting, talking while driving kills thousands

Title: Texting, talking while driving kills thousands
Description: *every year*

craig-oxley - October 18, 2010 12:12 AM (GMT)

Texting, talking while driving kills thousands every year

Sunday, October 17, 2010 by: Ethan A. Huff
http://www.naturalnews.com/030072_texting_driving.html

A new study published in the American Journal of Public Health is one of the first of its kind to analyze the effects of driving while talking on a mobile phone or "texting". According to the findings, roughly 16,000 people died between 2001 and 2007 due to mobile phone-related traffic accidents.

"Our results suggested that recent and rapid increases in texting volumes have resulted in thousands of additional road fatalities in the United States," wrote Fernando Wilson and Jim Stimpson from the University of North Texas Health Science Center and authors of the study in their report.

The data indicates that right around the time texting volumes significantly increased, there was a corresponding increase in the number of automobile accident fatalities that involved driver distraction, pointing directly to phone use in the car.

"Since roughly 2001-2002, texting volumes have increased by several hundred percent," Wilson is quoted as saying in a recent Reuters article. And according to the same article, texting volume increased an astounding 11,000 percent between 2002 and 2008.

"Since 2001 our model predicts that about 16,000 people have died since then that we attribute to the increase in texting volume in the United States."

Interestingly, overall traffic deaths are actually down, having hit their lowest level since

the 1950s in 2009. But among these, the proportion of those attributable to mobile phones has drastically increased compared to other causes of death.

"Distracted deaths as a share of all road fatalities increased from 10.9 percent to 15.8 percent from 1999 to 2008, and much of the increase occurred after 2005," wrote researchers.

Many states have already outlawed texting while driving or talking on the phone without a hands-free device in order to curb the sharp rise in accidents and deaths. But others say that individuals, rather than the government, need to be begin taking more personal responsibility for their actions by saving their conversations for when they are not driving.

Health: A Cancer Muckraker Takes on Cell Phones

Posted by Bryan Walsh Monday, September 27, 2010 at 6:00 am
http://ecocentric.blogs.time.com/2010/09/2...+Top+Stories%29

If anyone would be receptive to the idea that cell phone radiation might play a role in cancer, it would be Dr. Devra Davis. The epidemiologist and toxicologist is an expert in environmental health, and she's made a career out of the idea that cancer often has more to do with what's happening to us than what's going on inside our genes. Her 2007 book The Secret History of the War on Cancer showed that some of the best medical minds in the U.S. played down the environmental factors behind cancer—from cigarette smoke to chemical exposure—far too long, in part because of deception and delay from industry.

But when a colleague raised the possibility that cell phones could be connected to brain cancer, Davis wasn't receptive. "I couldn't believe it and I didn't want to," says Davis. "These were attractive devices. Cell phones were like cars—you couldn't imagine life without them." But as she began to look seriously into the field, Davis began to have doubts that cell phones were harmless. She found evidence of studies, some decades old, showing that the radio-frequency radiation used by cell phones could indeed have biological effects–enough to damage DNA and potentially contribute to brain tumors. She found that other countries—like France and Israel—had already acted, discouraging the use of cell phones by children and even putting warning signs on handsets. She found evidence of increases in certain kinds of brain tumors among unusually young patients who were heavy users of cell phones. And, just as she saw with tobacco and lung cancer, Davis discovered that the wireless industry—often with the help of governments—had fought independent scientists who studied cell phones, and helped produced questionable science that effectively clouded the issue. "This is about the most important and unrecognized public health issues of our time," says

Davis."We could avert a global catastrophe if we act."

Her new book Disconnect is the result of those investigations, and it's convincing enough to give you pause before you fire up that iPhone. I've already covered the possible connections between cell phones and cancer—you can see my February story in TIME for a backgrounder on the scientific debate, and another piece I did recently on the Interphone study, a collection of international studies on mobiles and cancer that was meant to clarify the issue, but only ended up further confusing it. It's a complex subject—mixing electrical engineering, biology and epidemiology—but Davis makes a strong case in her book that we've underplayed the possible threat from cell phones for too long. We're disconnected—even as worrying studies have begun to pile up, however quietly, the message has been slow to reach those in public health and even slower to reach the government. "The fact that we don't know everything about the subject doesn't mean that everything is fine," she says. "I can't tell you that cell phones are dangerous, but I can tell you that I'm not sure they're safe."

The wireless industry has an easy answer for this: in the thousands of studies that have been done on cell phones and health, few of them have shown any effect—and public agencies like the Federal Communications Commission (FCC) and the World Health Organization have found no clear health risks. As CTIA, the wireless industry group, says in a statement on its website: "To date, no adverse health effects have been established for mobile phone use."

The magic word there is "established," because as Davis argues in some of the best passages of Disconnect, it could be that we haven't established the dangers of cell phone use because we haven't asked the right questions—and that might be on purpose. "If you don't want to know the answer," Davis says, "don't ask the question." Much of the research into the biological effects of cell phone radiation has been underwritten by the... cell phone industry, and you don't have to be a raging paranoiac to wonder whether that money might have an impact on the conclusions of those thousands of studies. After all, in this case—just as it was with tobacco and lung cancer—doubt is the friend of industry. To hold off the possibility of legislation or regulation—not to mention lawsuits—wireless companies and their advocates don't have to prove that cell phones are safe beyond any doubt. They just have to play defense.

However, as Davis shows in Disconnect, that argument is going to get tougher and tougher to make. In one of the finest passages of her book, Davis details the tale of Dr. Franz Adlkofer, a German scientist who had long been involved in tobacco research. Like many scientists—more than medical science might like to admit—Adlkofer was willing to take money from the tobacco industry to fund his research, without really thinking about how that might constrain his work. He was, in a sense, a company man. But when Adlkofer began working with the wireless industry and produced research showing that cell phone radiation unravels DNA, he suddenly found his work under attack by the industry that had funded it. He was accused of fraud in highly suspicious

circumstances (he fought the charges, and they were eventually withdrawn), and says the industry paid other scientists to produce studies that would discredit his own work, as he told Davis in Disconnect:

I can't prove this, but here's what I think they did. The industry never liked this work. From the first they heard about it, they set out to discredit it. I had seen this happen with tobacco science so often, especially at the hands of the American companies. Yet suddenly it was happening to me.

Davis is justifiably suspicious of Adlkofer—he was a tobacco scientist, after all—but ultimately his story seems to check out. He's also far from the only researcher Davis meets whose career suffered after challenging the conventional wisdom on cell phones and cancer. Davis shows that independent studies on cell phone radiation found dangers at more than twice the rate of industry-funded studies—though because the cell phone industry is the source of much of the funding of cell phone studies, there are far more of the latter. And ultimately that is what is truly disturbing about Davis's book. Time and again, she shows the way that industry has been able to twist science just enough to stave off the possibility of any regulation—and finds that researchers are afraid of challenging the status quo, lest they find themselves suddenly out of a job, denied the lifeblood of research money. Most of the few brave researchers who challenge the prevailing wisdom on cell phone radiation—like the electrical engineer Om Gandhi or the bioengineer Henry Lai—are senior scientists, secure in their positions and their tenure. But a young researcher just starting out is far more vulnerable to industry pressure. Science isn't as pristine as we imagine it. "There has not been truly independent research in this field," says Davis. "That has to change."

Davis wants to see the government fund new studies on cell phones and health, independent of government interference—and fortunately the National Toxicology Program will be running its own tests, though not until 2014. The good news in the meantime is that you don't have to throw away your cell phone to minimize any potential risks. Simply using a wired headset should significantly cut down on radiation exposure to the brain, although Davis recommends that children—whose thinner skulls can absorb higher levels of radiation—avoid using phones altogether. "We do so much to protect our children from all manner of threats," she says. "We need to protect them from this as well." Read Disconnect, and you'll be on guard as well.

Subliminal Distraction

If you use computers in small business offices, dorm rooms, or at home save this page to your desktop.

That will allow you to read the material and visit the psychology notes pages and their links to evidence later.

This material is from first semester psychology psychophysics. But no one has investigated this phenomenon before.

The first phase of this psychology project is complete.

This site is a difficult read. Pages are organized around investigation subjects.

The introduction below, 400 words over four screens, outlines the site.

Scroll Down

Skip intro text- go to list of pages..

Breaking News:

Ontario Elementary Schools: Fourteen schools in Ontario Canada report children having medical problems after Wi-Fi transmitters were installed. The symptoms stopped when children were away from school and left for summer vacation. But video shown on CBC News shows children sitting side by side in computer labs without Cubicle Level Protection.

Foxconn Factory/city Suicides - page under construction As of August 6th there have been fourteen suicides of factory workers in the Peoples Republic of China where the workers live on site in apartments and dormitory style rooms with 8+ people in each room..

'France Telecom' Suicides There have been 25 suicides of employees at France Telecom in the last 20 months. Video online shows that some work locations have modern low wall workstations but others have terminals lined up side by side without protection.

Site Outline Jan 30, 2010 A rewrite of the site summary places the content of this site in a broad outline explaining what it is all about. Start your investigation reading this outline. Click Here. Wide spaced for easy reading from a computer screen it runs 26 pages in Microsoft Word. Remember this is from seven years research.

Subliminal Distraction a one page explanation of the physiology.

Introduction: 400 words 4 screens

Forty years ago designers and engineers accidentally discovered

that under special conditions normal features of the physiology of sight could cause a mental break.

The phenomenon is thought to be a harmless nuisance in the design of crowded office workspace.

The Cubicle was designed to deal with this problem and stopped the mental events after 1968.

It hasn't occurred to anyone that in today's world students and others can replicate those "special circumstances."

Seng-Hui Cho, the Virginia Tech shooter did that.

We all saw the paranoid psychotic rant Subliminal Distraction exposure produced.

(I have two letters from Virginia Tech promising an investigation but no action was taken.)

This phenomenon would make Virginia Tech responsible for the shooting.

Subliminal Distraction arises from normal features of physiology taught in first-semester college psychology.

Two of those features form a "conflict in the physiology of sight."

You can successfully ignore distracting movement in peripheral vision but you can't stop "subliminally seeing" it.

There are no "off switches" for the sensor cells on the rods and cones in your retina.

If stimulus reaches them neural impulses go to your brain no matter what you are doing.

When you learn to ignore distracting movement in peripheral vision, the expected startle will stop

but the subliminal functioning of the reflex system prevents you becoming aware

of your brain's continued efforts to warn you of threat-movement.

Those neural impulses and your brain's efforts to form a startle and vision reflex are a Subliminal Distraction.

When you create the "special circumstances" so that the startle is attempted several times each hour,

for several hours daily, and for many days, the subliminal appreciation of threat

eventually colors thought and reason.

In all of human history this phenomenon has only been discovered once.

In the 1960's designers, engineers, and human factor scientists were hired to modernize the business office. Their first prototypes were movable close-spaced workstations. Some of the workers using that design began to have mental breaks. Because they knew what they had done to start the problem they quickly solved it. But the investigation stopped there. No one ever made the connection to mental illness.

They made three basic mistakes.

They thought their encounter was the first time the phenomenon had appeared.
They believed that it could only happen in a business office.
To this day they believe it can only cause a harmless episode of confusion.

This site gathers historical records to show that none of that is true.

So few people are aware of it that it is never considered when there is a mass school shooting, college suicide, or strange student disappearance.

Through Qi Gong and Kundalini Yoga the outcomes of exposure can be shown to be:

unattributed fear - to the point of trembling,
paranoia,
psychosomatic symptoms and strange skin sensations,
panic attacks,
depression and thoughts of suicide.

This phenomenon of physiology has always been present in any human population.

What is the exposure to cause psychiatric symptoms?

In the Landmark Seminar mental breaks happen after three days of ten hours per day exposure.

In ICU Psychosis mental breaks happen in five days of exposure every fifteen minutes around the clock as long as the patients eyes are open.

In Qi Gong and Kundalini Yoga mental breaks usually happen on retreats or after many group practice sessions in a compact time frame.

Regardless of the location there must be a site or sites where exposure happens. Exposure is cumulative since subliminal sight does not identify the object that moves to trigger a startle and vision reflex attempt.

Subliminal sight reacts to movement only. A stationary object in subliminal sight is invisible.

This means that in all the cases above those who have the mental breaks might have exposure before attempting the at risk activity. The activity pushes the subject over the threshold for significant exposure.

Computer use in the home or dorm room must be considered if that workstations does not have Cubicle Level Protection and there are sources of movement in peripheral vision.

Everyone has this exposure every day. Most of it is harmless.

The problem arises when you create the "special circumstances" for massive exposure in a compact time frame.

How to use this site.

Most pages here should be viewed as stacks of index cards, research notes.

You may use this material with some limitations, see the Copyright page.

To understand this phenomenon you should start with the Demonstration page to experience the phenomenon safely.

Then read the Everquest Connection page to understand how exposure can shape thought.

A recent casual discussion revealed that this phenomenon has also appeared on a "medical program" on Dish Network.

If you are aware of the name of that program email Researcher. (New contact form is available.)

Expanded Definitions of Subliminal Distraction, Subliminal Sight, and the Conflict of Physiology. (Bottom of page.)

To

Virginia Tech Mass Shooting

There is evidence in an interview on "Scarborough Country" and on Greta Van Susteren's "On The Record" that Cho Seung-Hui created Subliminal Distraction exposure to cause the Virginia Tech shooting

Before you begin your investigation on this site, consider this question.

Can you cite a single case of someone blind from birth having Panic Attacks, or Schizophrenia?

I can't find one and volunteers searching the APA database could only find those with partial sight.

There were none among the completely blind.

An anonymous page on the Internet says there are only two such cases in all the literature.

Why is that true?

The subject of this site is a vision driven problem discovered when it caused mental breaks for office workers.

If mental illness is caused by chemical imbalances why would the blind be immune?

Site Pages

Scroll down the list for your research interest.

New pages appear first then in alphabetical order.

New pages

Joseph Morse College Suicides 6/1/2010

New information demonstrates that college students are exposed when they study or use a computer without Cubicle Level Protection.

Does Mental Illness Exist?

This new page under construction Tuesday September 28, 2010 07:34 PM -0500 Explores this often questioned premise. Like the Site Summary page is is an article without links to source material. Normal features of the physiology of sight can cause both sudden psychotic episodes and fixed altered mental states.

Design Community Question

When I began this site I did not have the correct name for the problem. This is a typical response to questions I asked on the Internet.

Drugs

First draft of the long promised page on psychotropic drugs. This page is incomplete and there will be many revisions.

Dr Peter Breggin

Dr Breggin in YouTube video about psychotropic Drugs.

Hollywood

Mental breaks of Hollywood personalities happen all the time. Are they caused by substance abuse or Subliminal Distraction.

How Exposure Happens

A simple explanation of how exposure happens in places other than business offices.

OCD

NEW PAGE UNDER CONSTRUCTION - News anchor Jeff Bell's site on his OCD raises new insights on the possible involvement of Subliminal Distraction and this disorder. I am interested in gathering a group of OCD subjects to test the theory that Subliminal Distraction creates the anxiety state that often begins OCD and BDD behaviors by the sixth grade.

Site Summary - The short version

This short article outlines the phenomenon on this site. It does not contain links to source material.

Subliminal Distraction -

At the request of a forum member on the Snopes Hoax site I am posting a single page explanation of Subliminal Distraction.

First Psychotic Episodes

Many reasons are given for first psychotic episodes. They usually involve the frailty of the human psyche. There is a simpler explanation.

Bizarre Behavior

Did you ever wonder why? Life is full of stories that just don't make sense. This week presidential aide Claude Allen was arrested for shoplifting. Given his position and income what he did is strange, bizarre behavior. In a normal mental state he would have known that Target stores have high security and have dealt with that type scam before. There is nothing new today. So why did he do it. For the same reason that Lt. Col. Holland believed his B52 could be banked sixty-five degrees at only 250 feet in the air. He did it for the same reason Qi Gong masters believe they have superhuman strength and supernatural powers. .. He may never understand what happened.

NASA Astronauts, Space Station New page August 24, 2005.

"Screaming Seaman" Have you served aboard modern US Navy submarines? Did you or someone you know have the sudden panic attack called Screaming Seaman. Visit the Astronauts & Insanity page (link above) and click the email link to" Researcher."

Recent use of "Whois" revealed hits from NASA. I have previously emailed the Surgeon General of the Air Force and had messages forwarded to the Center for Space Medicine. The small compartments in a orbiting space station will place the crew in close proximity. The phenomenon of physiology could easily be engaged to cause problems. As long as the crew interact during the mission there will be no problem. When any crew member enters a state of concentration their Peripheral Vision Reflex system would subliminally detect movement of other crew members. There was a psychotic mental break aboard Salut 5 shortening the Soyuz 21 mission.

This has happen when a Belgian research ship was stranded in polar ice for several months, 1898/99.

Illustrations using NASA ISS photos have been added. Subliminal Distraction on the Space Station.

ICU Psychosis

One in three hospital patients spending more than five days in an ICU unit experience psychotic episodes including hearing voices. This page presents a method to test the cause of ICU Psychosis.

A recent communication revealed this problem. The description from interviewing family of a victim indicated that SPVP is a likely cause of apparent delirium in hospital ICU units. This would not include drug caused delirium. If the patient's eyes are open for a

few days before a psychotic episode starts then SPVP is the likely cause. At least half of all movement in the ICU would be toward the patient. Frequent visits to adjoining patients in open ICU's could also created Peripheral Vision Reflexes.

Indigo Children

There is a movement to classify gifted children who exhibit bizarre belief systems as Indigo Children. This name stems from the "indigo aura" they are believed to radiate. The symptoms are similar to those of schizophrenia. But they retain the normal functioning that is missing for schizophrenics. They hear voices and believe they have psychic powers including speaking to the dead, spirits, angels.

Alphabetical listing

Accidental Operant Conditioning (First Draft)

This new page explains the theory of what causes the vastly different symptoms of mental illness. It posits that most mental illness is caused by a conflict of human physiology. That phenomenon allows the subliminal stimulation of the subconscious. Each person's experience is different. Paranoia and un-attributed fear are the only frequent common outcomes.

ADD & ADHD (First Draft)

This page separates ADD and ADHD information from the Cause of Psychotic Mental Illness page.

Anxiety Panic Attacks

Un-attributed fear is a feature of this phenomenon of physiology. At lower levels of stimulation in Subliminal Peripheral Vision would the phenomenon produce panic attacks rather than the full dissociative mental break?

B52 Crash Fairchild AFB

On June 24, 1994 Lt. Col. Holland was practicing maneuvers for an air show. While executing a "go-around" at 250 feet altitude, the plane stalled and fell out of the air. It was physically impossible for the plane to do what he tried.

Brainwashing and Mind Control

The Heaven's Gate mass suicide serves as a model for cult activity and explains mind control as exposure to Subliminal Distraction.

Captain Button

On April 2, 1997 Captain Button drifted out of formation, flew five hundred miles, and crashed in Colorado. The Air Force concluded that he committed suicide. That is not inconsistent with his death having been caused by a mental break due to exposure from Subliminal Distraction in the cockpit of his A10.

Chaco Canyon (Page Link)

Pueblo cities of the American Southwest experienced an abandonment 1100/1300. Current scholarship indicates they left large cities to live in small groups. They had become wealthy manufacturing goods for a vast trade system. All their efforts would have involved close hand work at arm's length while engaging mental investment, concentration. --- The concentration of trepanations, to let out the demons, in other societies, exhibiting that behavior, may mark the phenomenon causing mental illness, Inca. -- Pathology of the Bog Bodies - (article link)

Children and Violence in Schools

Close-spaced seating in class rooms copies the close-spaced workstation problem discovered in the business office. Unlike Knowledge workers students only engage deep mental investment for short periods each day. The level of exposure for students would be lower but persistent and long term. Many problems including attention disorders or serious mental illness with onset in late adolescence may be connected to this phenomenon. (Unfinished page.)

College Suicides

There has been speculation that the increased college suicide rates are somehow connected to the parallel invention and increased use of the personal computer. It isn't the computer. It's the workstation where the computer is used. High suicide rates at MIT and NYU indicate an engineering design problem with work and study space at such schools.

Joseph Morse disappearance suicide

Cults, Brainwashing, and Subliminal Distraction

Cults are opposed and feared by the general population. But within the cult group they believe they have instructions from a superior force or being to convert non-believers. How does that belief arise?

Culture-Bound Syndromes

The phenomenon explored on this site is a part of all human physiology. Cases should be appearing all over the world. Where are the cases? They may be misunderstood and disguised as Culture Bound Syndromes. If you examine these syndromes with the filter of "sudden dissociative or psychotic episode which resolves with no treatment" one group stands out. If you examine the list again through a filter of "activity which has detectable movement in Subliminal Peripheral Vision" others stand out. Brain Fog from West Africa and QiGong psychotic reaction, China, Icelandic Disease, and Windigo Psychosis . The challenge is to gather information that will demonstrate the connection for all of the Culture Bound Syndromes. These syndromes are in the DSM but there is no information there on the cause.

Jumping Frenchmen of Maine Syndrome, Latah, Malaysia, Mirachit (Myrachit) , Siberia, provide a connection to Accidental Operant Conditioning. The symptoms of jumping diseases, startle matching behaviors, are so strange they cannot be mistaken for anything else. Current work attempts to establish that they are a neurological problem. But they only happen where there is exposure to Subliminal Distraction.

Demon Possession Explained

Spirit possession happens around the world. Most cultures and religious belief systems believe that this apparent paranormal possession actually happens as a supernatural event.

Demonstration

As a normal feature of physiology this phenomenon can be experienced with a simple demonstration. The fading to extinction of notice of stimulus, movement, in Subliminal Peripheral Vision is the goal.

Depression

Depression is seen as a cause of disorders because it is seen in many of them. But no one has proposed that depression is an outcome of exposure to Subliminal Distraction.

Dissociative Fugue Cases

An epidemic of Fugue cases happened in 1880's France then spread to other countries.

Modern cases are listed as they are located.

EST Werner Erhard

A group seminar training program of the 1970's caused psychotic episodes for some who participated. Why did that happen and was it a manifestation of the reason the seminar worked for others? Why do cults capture followers? Just as in Qi Gong and Kundalini Yoga participants who concentrate on the lecture can subliminally detect movement near them.

The Everquest Connection

Shawn Woolley's mother sued Sony believing that the addictive qualities of the on-line game Everquest caused his suicide. There were about twenty cases of serious mental outcomes.(I found three plus two N64 lawsuits.) The games were different, the players different, the computers different, the workstations different. What was the common element? Each effected player had created the same defect in their workstation and one of two things happened. There was detectable movement in the room or the hard drive busy light was incorrectly positioned so that it was mistaken for threat movement in Subliminal Peripheral Vision. The simple psychology of what happens to cause this effect is explained.

Flight 19

December 1945, five Avenger torpedo bombers disappeared while on a training mission from Ft. Lauderdale, Florida. The belief by Lt. Taylor, a combat veteran with more than 2000 hours flying time, that they were in the Gulf of Mexico rather than the Atlantic was a stunning mistake. It was not physically possible given the time frame 1.5 hours into a 2 hour mission, and their position, about 100 miles east of Florida. How could a trained pilot make that mistake? It might happen if he had been in an altered mental state.

Guest Book

The old Guestbook is not operational and we cannot keep it working due to repeated hack attempts. A new page titled Guestbook has been installed. A new email link to Researcher has been installed. Due to spam emails the address is now on a contact page. You can reach that page by clicking the "Researcher" link. A new contact form is now available. It should solve the problem of spam emails.

History of the site and the investigation. (May 20, 2007)

This group of pages tell the story of this site. They include responses from designers and others.

A question on an Architectural Forum has one response after five years.

An incident of mass insanity on the Belgian Polar Expedition 1898 demonstrates psychiatric outcomes of SD exposure.

Qi Gong and Kundalini Yoga demonstrate different outcomes from exposure of different rates.

Jason Weed's mental break establishes that Subliminal Distraction exposure happens in classroom situations.

Personal Experiences - New material is being added to Connie Tucker's case history.

Additional pages will be added as the site is edited.

Intermittent Explosive Disorder

Believed to be a problem of brain chemistry and impulse control, the mention of amnesia of the events during an episode point to Subliminal Distraction and a Dissociative mental event.

"Interrupted Journey" (John Fuller)

Forty-Four years ago aliens from the Zeta Reticuli Star System visited New Hampshire and abducted Barney and Betty Hill. This is the seminal case for alien abduction. Did it happen as remembered and reported? Are all non-hoax alien abductions the phenomenon at work? Should Alien Abductions be investigated as a sub-set of Culture-Bound Syndromes, created during the confusion of a sudden onset dissociative episode?

Jumping Frenchmen of Main Disorder

Discovered at Mooselake Maine in the 1880's among French Canadian Lumberjacks this strange disorder establishes that operant conditioning is featured in the cause of mental illness.

Kundalini - Yoga

Unknown to people outside the practitioners of Yoga is a mental state called Kundalini, an awakening. It is believed to be an ultimate state of awareness. Some report serious somatic and psychiatric symptoms connected to this Yoga exercise form. Subliminal,

Accidental, Operant Conditioning is the cause of both the beneficial and detrimental effects of this exercise form.

Mary Shotwell Little - Dianne Shields Disappearance Solution

When I called the Atlanta Police Department cold case officer about this solution he remembered that the Atlanta Police Department had problems with the phenomenon before they switched to Cubicles. Little disappeared at 25 in 1965. She would be 65 if she is still alive. Most Dissociative Fugue victims just disappear. Mary Little arranged help to disappear.

Mass Shootings (under construction-- incomplete page)

Mark Barton shooting Atlanta 1999, Day Trader Shooting

There has been another Post Office shooting at Goleta California. A new page has been created. Link here.

Ratzman Shooting Brookfield Wi --No Page-- Ratzman was a computer tech. If he set up an unprotected workstation in his place of employment or at his home he could have experienced the expected dissociative/psychotic mental break.

Pictures should be taken of his work place and any home computer installation. No one will remember small details weeks later. Anything that moves near the computer or light that blinks is suspect. Look for something that changed as far back as when he started having problems at work.

Red Lake School Shooting This recent event copies the Columbine, Pearl Mississippi, and Conyers Georgia shootings. Only someone on the scene with the ability to inspect the shooters home study and computer workstation can make the connection to the phenomenon on this site. I plan to call the tribal council when I have an explanation page up.

A picture of the bedroom computer workstation of Finnish school shooter Pekka-Eric Auvinen is now available on the Redlake shooting page. It is the first picture evidence of Subliminal Distraction as the cause of a school shooting.

Campbell County High School Shooting -- Posted at the bottom of the Red Lake Shooting page.

Mass shootings at schools such as Columbine are a new phenomenon. In that case and many others computers were involved. It has not occurred to anyone that workstations are also involved. Some of the shooters in prison still have psychiatric symptoms. One hears voices. These psychiatric problems argue that he had a mental event to cause the shooting.

Matthew and Mary Winkler Not a mass shooting but a very strange event. Details are unfolding as the page is written. Nothing in the current information indicates that this shooting was caused by exposure to Subliminal Distraction. But accounts from psychologists indicate a mental event happened. There is another strange shooting reported at the University of Toledo, Andrew Brown and Michelle Danielle Mielecki.

Missing Students

When students sit for hours studying or using a dorm room computer they have essentially created a workstation. A shared dorm room becomes a two person cubicle. There are several cases of the unusual disappearances of college students. Is there a common element to cause this?

Student Disappearances 2006 The disappearance of four students near Halloween captured attention because they happened geographically close together. The disappearances are still happening but they are scattered in time and place.

The Modern Cubicle

Over fifty years ago an accidental discovery changed the way office workspace must be designed.

Mysterious Disappearances

Dissociative Fugue is a diagnosis in the DSM. In some countries it is called Running. This diagnosis is based on finding someone who had suddenly left family, job, and friends then established a new life with no memory of the previous life. How many have not been found? There are news reports of events, sometimes involving suicides, apparent murders, and sudden disappearances, which just do not have an explanation. Are all the different events linked?

Perry March has been deported from Mexico and returned to Nashville Tennessee. Janet March disappearance.

What happened to Jennifer Wilbanks. New page.

Dissociative Fugue Cases, associated with mysterious disappearances.

An epidemic of Fugue cases happened in 1880's France then spread to other countries.

Personal Experiences

In the summer of 2002 Connie Tucker's office in University Payroll moved to the basement of the Rose Administration Building. Within about thirty days she began to

exhibit bizarre behavior. Central to this behavior was extreme anxiety and psychotic paranoia. They had moved the office coffee table from the break room to her office. It was placed so that as she worked she would subliminally detect movement in peripheral vision as staff came to the coffee service table. This page is a severely abbreviated case history. We have been unable to find any mental health professional with knowledge of this psychiatric injury. That fact along with the knowledge that the phenomenon could have happened anytime in history so long as the conditions are met leads me to believe the phenomenon may be at the bottom of much more than temporary dissociative or psychotic disorders. (DSM)

Psychotic Mental Illness

Wrapping it all up. Does a conflict of human physiology, unknown by the mental health establishment in the US, lie at the bottom of most cases of mental illness? (Exclude genetic, chemical, drug caused psychosis and physical brain injury.) Read the presentation and you decide. The presentation is not finished but you can easily follow the thread.

The examples of mental problems in Qi Gong and Kundalini Yoga are used to model Schizophrenia.

Article - A text only page without the index card style format has been written. You may be more comfortable reading about the cause of mental illness starting here.

PTSD

PTSD is believed to be caused by witnessing or being a victim of trauma. It replaces Combat Fatigue as the new term for dissociation and psychosis that is created in battlefield situations. But the symptoms happen other places where there was no trauma. Onset is sometimes as much as six months after the trauma that is believed to be the cause of PTSD. How is that possible? (In one cited case the "trauma" was the holocaust sixty years ago.)

Cubicle Level Protection in the military Military released photos are used to illustrate Cubicle Level Protection

...Prevention ...

A small text section at the bottom of most pages. Simple precautions in homes, dorms, student apartments, and small business offices will provide Cubicle Level Protection, FREE.

QiGong Psychotic Reaction

"zou huo ru mo" = the body is catching fire & "pian cha"= deviation There is a history from those who have serious mental and physical problems associated with long term use of this slow motion martial arts exercise. Case histories from China say victims become addicted to Qi Gong and can't/won't stop gathering others to exercise with them. Exposure to Subliminal Distraction only happens when the exercise is done in groups. Subliminal, Accidental, Operant Conditioning causes both the beneficial and detrimental effects of this exercise.

Schizophrenia

Schizophrenia is preventable with simple changes in behaviors and changes in how classrooms are designed and used. The theory of Schizophrenia is separated from the Cause of Psychotic Mental Illness page.

Subliminal Peripheral Vision

The facts of human physiology involving subliminal sight and peripheral vision reflexes are so bizarre that even college students in psychology classes have a hard time believing them the first time they hear them.

Subliminal Peripheral Vision Psychosis, SPVP

A coined phrase to describe the condition of a narrowly focused altered mental state. This condition is undetectable unless the victim does or says something that obviously contradicts normal reality. Example: Yogis who profess the ability to levitate, dematerialize, read minds, move objects with thought, communicate and direct the actions of others through mental telepathy, function normally within their community of common belief set and are revered as enlightened.

Virginia Tech Mass Shooting

The psychobabble has already begun. Experts are primed to go on national TV programs to explain why Cho Seung-Hui was driven to commit the murders. A few words by a suite-mate explains it all. He had behaviors that would have exposed him to Subliminal Distraction. The unknown exposure would have caused his disturbed behavior that led to the event.

_____

Use your [back space] key to return to text. [Home] will return to the top of the page.

Prevention: This section is now repeated at the bottom of every page.

The rare occurrence of the injury establishes that is difficult to create enough exposure to cause an injury. But when it does happen the consequences are serious, possibly fatal.

Our personal experience was intermittent human traffic during eight-hour workdays for thirty calendar days.

If you have a tower CPU mount it under your desk. That's the way they position it in a cubicle. The hard drive busy light is about the height of your low peripheral vision if you put the tower on the desk. Desktop reading of text or writing notes beside the keyboard on the side of the monitor away from the tower makes the blinking hard drive busy light appear to approach from behind when you turn to view the screen again.

If you have a computer work station/desk in which you turn ninety degrees to write or do other non computer work, turn off the monitor when you turn aside. Remove screen savers in this instance. The movement, animation for example, in your screensaver, two-dimensional movement, might well be detected by your peripheral vision at close range. Alternately cover the monitor screen.

All home, apartment, or dorm computer workstations are in unprotected workspace. To change that put the computer in a quiet room with no possible movement. If that is not possible in a dorm or apartment position the computer so that your peripheral vision can see only stationary walls as you use the computer in a busy room. In Cubicles and 'Systems Furniture' these protective features are achieved with peripheral vision blocking panels and corner seating positions. It is called 'Cubicle Level Protection.'

If you use computer or CD-ROM games for many hours day after day, the game playing position should follow the same rules as the computer workstation. Battery operated games will not run long enough on a single rechargeable battery to cause a risk for SPVP.

Although a laptop does not have a visible blinking light in peripheral vision the same rules apply to your work position. There should not be human traffic moving to you from

behind. There should be nothing behind you, which could enter your subliminal peripheral vision field as you turn your head while working at the laptop and be mistaken for threat movement.

Only movement coming from behind you into your Subliminal Peripheral Vision can cause a peripheral vision reflex. If the movement source approaches you from ahead then enters your Subliminal Peripheral Vision from conscious sight there can be no peripheral vision reflex.

Repeated for Emphasis:

A single session or rare sessions will not cause this problem.

It is the same day after day long hours of play or computer use with detectable movement in ‘Subliminal Peripheral Vision,’ which would form the basis of a risk for SPVP injury.
Exposure can be cumulative

The brain’s detection system only evaluates movement. There is little recognition of the nature of the object in peripheral vision. If you have several hours exposure from human traffic at the library, while reading at an open table or seated in a reading room chair, followed by long hours watching TV with a critically misplaced ceiling fan sweeping detectable shadows around the room, the combination of those two behaviors might cause the problem. The suggestion is that either activity alone would not consume enough exposure time even if the critical movement is present.

This material is contained in first semester college psychology lectures under psychophysics. It may appear in textbooks with slightly different wording but the basic facts of physiology are the same.

Conflict of Physiology

Humans have the ability to ignore things in their vision field but we cannot "stop seeing" any thing in that vision field. These two facts are in conflict with each other. When you ignore something in your vision your conscious mind attaches a zero level of attention to it. But there is no on/off switch for the sensor cells on the rods and cones of your retina. They continue to send neural impulses to your brain. This might be harmless except for a subliminal, vision driven, warning system. (This term, using the facts of the physiology of sight, is unique to VisionAndPsychosis.Net.)

Subliminal Sight

A thin portion of your vision field functions subliminally to detect only movement. Stationary objects in this area are invisible. Perform the psychology Demonstration to experience this.

Peripheral Vision Reflexes

Every human who ever lived had subliminal sight and peripheral vision reflexes. If you

have startled when someone stepped up beside you or reacted when you caught something 'out of the corner of your eye,' that was a peripheral vision reflex. This is a primitive system to warn first evaluate second. Only movement and position information are included in the impulse to cause the startle. You identify the object, with shape and color information, when you turn and look.

The vision system to detect threat-movement can be said to function below thought, reason, and consciousness. If that were not true we would have a very complicated vision system. The fields of conscious sight overlap giving us depth perception. But the fields of vision in far-peripheral vision, subliminal peripheral vision, are different.

Subliminal Distraction

Subliminal Distraction arises from these simple facts of physiology. In the United States acoustic distraction is usually the meaning of subliminal distraction. This refers to the sounds you subliminally perceive in an office situation when you are dissociating slightly to perform knowledge work. It is believed to be a fatiguing factor. Visual Subliminal Distraction is usually unknown in the field of psychology although the facts that explain it are taught. (It was included in the course I took in about 1990. This course had been developed for a nursing program but was taught to all students.)

When you dissociate to concentrate on an activity, perform knowledge work, or even daydream your subliminal vision detection system will break your concentration with a startle if movement is detected in far-peripheral vision. The cause of that movement (nature of the source of movement) is not included in the warning.

In the field of Design that threat-detection and your brain's efforts to create the startle is called Subliminal Distraction. In psychology the information is the same but only elemental distraction is included in the definition. There are few references to the 1960's accidental discovery that mental breaks can be created when this system is constantly triggered for days or weeks.

Sensory Adaptability

Sensor cells in your eyes and ears function through chemical action to create the neural impulses that are sent to the brain. When there is intense stimulation it will exceed the cell's ability to recycle those chemicals causing depletion. The impulses will decrease in amplitude. Micro movements of your eyes refresh cells in your retina preventing sensory adaptability.

Repeat: Hearing has sensory adaptability but not sight. That means that the subliminal detection system does not decrease intensity of the neural impulses to trigger a peripheral vision reflex with repeated use.

Title: Industry study shows brain tumour link to heavy
Description: *mobile phone usage*

craig-oxley - October 11, 2010 12:41 AM (GMT)

Industry study shows brain tumour link to heavy mobile phone usage

Adam Cresswell – The Australian May 17, 2010

A LONG-awaited international study of the health risks of mobile phones has linked extended mobile phone use to an increased risk of developing brain tumours.

The 10-year Interphone study, the world's biggest study of the health effects of mobile phones, found while there was no increased risk of cancer overall, those in the top 10 per cent of phone use are up to 40 per cent more likely to develop glioma, a common type of brain cancer.

Just 30 minutes of mobile talk time daily was enough to put participants into the top 10 per cent category in the study, carried out in 13 countries, including Australia, and involving more than 5000 brain cancer patients worldwide.

The International Agency for Research on Cancer, which conducted the study and has repeatedly delayed its publication, summarised the findings by saying there were "suggestions of an increased risk of glioma, and much less so meningioma, in the highest decile (10 per cent) of cumulative call time, in subjects who reported phone use on the same side of the head as their tumour".
It added "biases and errors limit the strength of the conclusions that can be drawn . . . and prevent a causal interpretation".

But the finding - reported by British newspapers yesterday ahead of its official scheduled release this week - has nevertheless ignited controversy among cancer experts, neurologists and other scientists.

Australian neurosurgeons Charlie Teo and Vini Khurana said last night the findings

were a concern. "Despite the study's methodological limitations that biased it towards finding nothing, the heaviest users were found to be at significantly higher risk of glioma, which is consistent with our message," Drs Teo and Khurana told The Australian.

"This (finding) does concern us, but it's also an impetus to do two things: the mobile phone industry has to supply the actual hours logged, and we need to track brain tumour incidence in Australia."

Other experts sought to reassure the public over the findings. IARC director Christopher Wild said an increased risk of brain cancer was "not established from the data from Interphone".

"However, observations at the highest level of cumulative call time and the changing patterns of mobile phone use since the period studied by Interphone, particularly in young people, mean that further investigation of mobile phone use and brain cancer risk is merited," Dr Wild said.

Although modern mobile phones have greatly reduced emissions the authors said phone use now was "much more prevalent and it is not unusual for young people to use mobile phones for an hour or more a day".

Industry group the Australian Mobile Telecommunications Association also emphasised the study found no increased risk overall, and its conclusion was "in line with the weight of scientific opinion, which has found no substantiated scientific evidence of any adverse health effects".

The study's authors said there was "reasonable doubt" about the credibility of some patients' estimates of their phone use, which in 38 cases amounted to over five hours per day, and 12 hours or more per day in 10 cases. People with cancer were much more likely to report these very high usage rates than other study participants without cancer who were included as controls.

Hidden health risk in mobiles: Phone giants accused of burying warnings in small print

By Sean Poulter
Last updated at 11:42 PM on 8th October 2010
http://www.dailymail.co.uk/news/article-13...mall-print.html

Mobile phone firms have been accused of concealing warnings about the health risks of using their handsets.

A warning that Apple's popular iPhone should be kept at least 15mm away from the body is buried deep inside the manual.

BlackBerry goes even further, saying customers should use their devices hands-free or keep them an inch from the body 'including the abdomen of pregnant women and the lower abdomen of teenagers'. Again, this advice is hidden in the instruction booklet.

All other manufacturers, including Nokia and HTC, carry similar small-print warnings despite insisting that holding mobiles against the ear and head is harmless.

Health campaigners and politicians on both sides of the Atlantic are calling for clear warnings to be put on handset boxes.

They are also demanding a public education campaign, starting in schools, to advise on the safe use of the devices.

Alasdair Philips, of Powerwatch, an independent group which investigates the safety of mobile phones, said: 'Most people have no idea about these warnings.

‘The safety advice should be included on the boxes and far more prominently in the “getting started” section of user guides and not just in the detail at the back that hardly anyone reads.

‘This should be only part of a much wider public education campaign that begins in the schools.’

The safety advice in manuals is designed to limit so-called Radio Frequency exposure. This is said to heat body tissue and some – inconclusive – research suggests it is linked to tumours in the brain.

Blackberry torch: Use hands-free operation if it is available and keep at least 0.98in (25mm) from your body when turned on and connected to the wireless network. Reduce call time.

Apple iPhone: When using near your body for voice calls or for wireless network data, keep iPhone at least 15mm (5/8in) away from the body and only use accessories that do not have metal parts. Again maintain at least 15mm separation from the body.

Nokia C6: Maintain a normal use position at the ear at least 15mm (5/8in) away from the body. Any accessory should not contain metal and should position the device the above-stated distance from the body.

Most RF exposure comes from the antenna and it can increase when a phone is kept in a pocket because phones increase their power output when a network signal weakens.

Men who carry handsets on their belt or in their pockets with the keypad facing outward will suffer higher exposure because the antenna, which is always at the back, is close to the body.

SAR – Specific Absorption Rate – is the standard industry measurement for the amount of RF energy the body absorbs.

Mr Philips said: ‘When a phone has to power up, it sends high SAR power into the trunk and towards the kidneys and liver. It can be the testicles if in a trouser pocket.

‘Some girls carry them in chest bags which hang just below their breasts. Breasts, eyes and testicles absorb external RF energy the most. Blood-rich organs, such as the liver, kidneys and heart are among the top energy absorbers.

Advice: Campaigners say pregnant women should keep their handset away from the foetus in the first six months

‘The ovaries and foetus are relatively well protected by the trunk, but it obviously makes

sense to keep the handset away from those areas, especially the foetus in the first six months. Many later-life causes of ill health are increasingly being recognised as having their roots in foetal exposure to chemicals, hormones, radiation of various sorts.'

He said most handsets also put out pulsed ELF magnetic fields which travel further into the body than RF signals. These are associated with childhood leukaemia and some adult cancers.

Caroline Lucas, Green Party leader and MP, said: 'Greens have never said don't use mobile phones, but we have always said that as with any other technology, we need to make people aware of any potential risks and give clear guidance regarding the safest possible use, so we can get the maximum benefit from the technology with the least possible risk.'

Mobile phone firms are legally required to advise customers on how to minimise RF exposure and use their manuals to do so.

Michael Milligan of the Mobile Manufacturers Forum said: 'A mobile phone can always be used up against the head without the need for this separation, because phones are designed to have the antenna far enough away from the head when making a call.

'Every mobile phone model is tested to make sure they meet national and international exposure limits for exposure to Radio Frequency emissions, before they can be sold in the UK or elsewhere.'

However, many new phones are so slim, antennas will be closer to the head than distances recommended by many manufacturers.

View Full Version: DEADLY COST OF LOW-FAT DIETING

Title: DEADLY COST OF LOW-FAT DIETING

TheUnhivedMind - July 12, 2011 06:26 PM (GMT)

DEADLY COST OF LOW-FAT DIETING

Monday July 11 2011 by Jo Willey Health Correspondent
http://www.express.co.uk/posts/view/258048...low-fat-dieting

MILLIONS of Britons are putting themselves at risk of heart disease and cancer with obsessive diets.

Doctors warned last night that continued calorie counting was a health time-bomb.

Cutting out nutrient-rich foods in a misguided attempt to lose weight could have “alarming” long-term consequences.

And with an estimated 12million Britons currently on diets it could prove devastating for the nation’s health, placing massive burdens on the NHS. It has long been known that an unhealthy diet can lead to a host of deadly conditions such as heart disease, diabetes, Alzheimer’s and cancer.

But a low-fat diet that lacks vital vitamins and minerals can also lead to long-term problems. A report found that many Britons have a dangerous attitude to food, being concerned mainly with cutting their intake of fat and calories rather than thinking about what they need to eat to stay healthy.

Experts are now calling on people to “re-learn” what good nutrition tastes like in a bid to stave off health problems for future generations.

Dietician Dr Frankie Phillips, said: “It would seem that despite all the recent education campaigns on healthy eating, the reality is our daily diets are still out of balance nutritionally at times, resulting in deficiencies in certain areas for some people.

“Whether this is because we are obsessed with counting calories, are struggling to afford to eat healthily or lack the time to think about what we are eating, if we continue in this way, it will seriously impact on our health both in the short term and in the future.”

The Seven Seas Nutrition Aware report – developed by nutrition experts and the Future Foundation think-tank – reveals that the modern obsession with dieting and weight loss is taking priority over healthy eating.

Nearly four in 10 people do not eat fruit and vegetables every day and only 26 per cent of Britons look for specific nutrients in their food.

More than a fifth of us claim to have started a diet at least once a month in the past year.

Some 23 per cent admit they buy their evening meal based on its low calorie count alone, irrelevant of whether it is nutritionally balanced.

At the other extreme, those who binge on sweets and junk food are also a cause for concern. The survey of 2,000 people found that nearly two-thirds eat sweets and chocolates once a week, with a third admitting they have them at least three or four times a week.

More than half admit they regularly buy foods they know are not good for them, with 38 per cent lured by price offers.

Dr Phillips, who contributed to the report, said: “While appropriate calorie and fat consumption is important, too much focus on this could be detrimental to adequate vitamin and mineral intake, which could lead to health issues in the future.”

The recommended daily calorie count is 2,000 for women and 2,500 for men.

Young people are most at risk of poor nutrition, sparking fears for their long-term health. Only a quarter of 16-24 year olds eat fruit or vegetables daily, compared with nearly three-quarters of over-65s.

Nutritionist Emma Derbyshire, of Manchester Metropolitan University who also contributed to the report, said: “It would seem that we are still struggling to grasp the concept of ‘good nutrition’ and the reason why we eat food in the first place. Though it is important to acknowledge calorie intake it must not come at the expense of eating a balanced and varied diet, low in saturated fat but also rich in vitamins, minerals and essential fatty acids.

“Often processed, low-calorie food can contain high levels of sugar and additives and so may not be as healthy as people think.”

View Full Version: HUGE RISE OF STATINS SHOWS SHOCK TOLL ON NATION'S

Title: HUGE RISE OF STATINS SHOWS SHOCK TOLL ON NATION'S
Description: *HEALTH*

TheUnhivedMind - July 5, 2011 04:44 PM (GMT)

Notice the same old nonsense of 'the benefits outweigh the disadvantages' that old chestnut is pounded around any time something is harmful. Remember they're dishing out these drugs to people who just do not need to alter their cholesterol levels. There is absolutely no need to alter cholesterol levels there is no scientific study of worth on the subject for a need to push these Liver and Spleen poisons which will then ruin your Kidneys and well its a host of symptoms then on. Keep well away from these inquisition drugs. They have the cheek to claim these poisons are saving lives? Theres more deaths and chronic disease now than there ever was. Theres more Heart disease today than there ever was with all the saturated fat eating of old. Wake up people its all a scam whilst they feed you vegetable oils which give you Heart disease and damage your arteries the same for the radiation levels in the last twenty five years since Chernobyl.

HUGE RISE OF STATINS SHOWS SHOCK TOLL ON NATION'S HEALTH

Statins are saving lives

Tuesday July 5,2011
http://www.express.co.uk/posts/view/256862...nation-s-health

CHOLESTEROL-busting statins make up a fifth of all heart medicines prescribed each year in England.

They are being dished out at the rate of more than a million prescriptions a week.

Shocking statistics from the British Heart Foundation (BHF) reveal that **266 million cardiovascular drug prescriptions are handed out each year.**

This is a huge increase on 30 years ago and shows the true toll the nation's harmful habits such as

gorging on junk food, smoking and boozing is having on long-term health.

In 1981 less than one per cent of prescriptions for heart and circulatory disease was for statins.

About seven million Britons take them to reduce artery-clogging “bad” cholesterol.

Prof Peter Weissberg, of the BHF said: “They’ve changed the face of heart disease treatment for the better and prevented many heart attacks and strokes.

“The benefits far outweigh any disadvantages.”

Miranda Kerr reveals her unusual supermodel beauty secrets: Tahitian Noni juice and **spoonfuls of coconut oil**

Last updated at 4:10 PM on 5th July 2011
http://www.dailymail.co.uk/tvshowbiz/artic...oconut-oil.html

Miranda Kerr has revealed her unusual health and beauty secrets in new interview.

The Victoria's Secret, who gave birth to son, Flynn, six months ago, credits Tahitian Noni Juice, a drink made from the noni plant, and coconut oil for her supermodel glow.

The obscure noni juice derives from the fruit of the Morinda citrifolia tree found in South-east Asia.

She tells Australia's Cosmopolitan magazine: 'I've been drinking it since I was 14, and when I've got a long day ahead of me, it's the one thing I can't live without.'

Manufactures claim the liquid 'supports your immune system, delivers superior antioxidants, increases energy, and allows greater physical performance levels.'

Bottles of the drink are not exactly cheap, retailing at around $38 for a litre of juice.

Kerr also preaches the benefits of coconut oil, which is claimed to benefit everything from skin and hair to weight loss.

She said: 'I personally take four tablespoons of coconut oil per day, either on my salads, in my cooking or in my cups of green tea.

'I will not go a day without coconut oil.'

The health-concious 5' 9" star put the results of her lifestyle on show on Saturday as she left the gym in Los Angeles.

She stopped by a health shop to pick up a freshly squeezed green juice.

Dressed in a pair of black Nike workout leggings and matching sports vest, it was clear to see her active lifestyle and healthy diet have most definitely paid off.

Title: High Doses of Cholesterol Drugs Raise Risk of
Description: *Diabetes, Researcher Find [SPLEEN]*

TheUnhivedMind - June 22, 2011 05:54 PM (GMT)

High Doses of Cholesterol Drugs Raise Risk of Diabetes, Researchers Find

By Michelle Fay Cortez - Jun 22, 2011
http://www.bloomberg.com/news/2011-06-22/h...chers-find.html

People who take high doses of cholesterol-lowering drugs such as Pfizer Inc. (PFE)'s Lipitor and AstraZeneca Plc (AZN)'s Crestor have a greater risk of developing diabetes and a lower risk of heart complications than those who take smaller amounts of the medicines, researchers said.

The finding supports work from the same researchers published last year showing patients taking the drugs known as statins were more likely to develop diabetes than those given a placebo. The risk of diabetes rising in parallel with the amount of medicine taken by patients strengthens the association, the researchers said.

The researchers analyzed five earlier trials, involving 32,752 patients, to tease out the effect of the drug dose. Those getting intensive treatment were 12 percent more likely to be diagnosed with diabetes, the study found. Patients also were 16 percent less likely to have a heart attack, stroke or surgery to clear their arteries or to die from cardiovascular disease during a five-year period than those given a smaller amount, according to the research.

"Clinicians should be vigilant for the development of diabetes in patients receiving intensive statin therapy," said the investigators, led by David Preiss, a research fellow at the University of Glasgow. "It is important to quantify any potential long-term risks to enable physicians and patients to make informed choices," they said.

The study appears in today's Journal of the American Medical Association.

View Full Version: Why eating 'light' crisps could make you gain MORE

Title: Why eating 'light' crisps could make you gain MORE
Description: *weight than opting for full-fat varietie*

TheUnhivedMind - June 22, 2011 01:48 AM (GMT)

Why eating 'light' crisps could make you gain MORE weight than opting for full-fat varieties

Last updated at 12:53 PM on 21st June 2011
http://www.dailymail.co.uk/health/article-...at-variety.html

Dieters who try to cut their calorie consumption by picking low-fat versions of their favourite snacks should be wary, scientists say.

They found that opting for 'light' crisps could encourage you to gain more weight by increasing hunger pangs.

Researchers at Purdue University in Indiana studied the effect of synthetic fat substitutes by comparing high-calorie Pringles crisps with low-calorie Pringles Light crisps.

They said their surprising results challenged the conventional wisdom that foods made with fat substitutes aided weight loss.

Lead author Dr Susan E. Swithers, said: 'Our research showed that fat substitutes can interfere with the body's ability to regulate food intake, which can lead to inefficient use of calories and weight gain.'

The team put two groups of rats on separate high and low-fat diets. They then fed half of each group normal Pringles and offered the other half a mix of normal and low-fat crisps.

The Pringles Light chips, which are available in the U.S but not the UK, are made with

olestra - a synthetic fat substitute that has zero calories and passes through the body undigested.

The team found that those on the high-fat diet gained more weight and developed more fatty tissue if they ate the low-fat crisps.

They also didn't lose the extra weight even after the potato chips were removed from their diet.

'Based on this data, a diet that is low in fat and calories might be a better strategy for weight loss than using fat substitutes,' Dr Swithers said.

Food with a sweet or fatty taste usually indicates a large number of calories, and the taste triggers various responses by the body, including salivation and the release of feel-good hormones.

Researchers studied the effect of synthetic fat substitutes by comparing high-calorie Pringles crisps with low-calorie Pringles Light crisps

Fat substitutes can interfere with that relationship when the body expects to receive a large burst of calories but is fooled by a fat substitute.

However, there is good news for those who watch what they eat. The rats who were fed a low-fat diet didn't experience any significant weight gain despite eating both normal and light crisps.

Dr Swithers said previous studies found saccharin and other artificial sweeteners found in diet drinks can also promote weight gain and increase body fat.

Dieters should therefore not turn to artificial means to lower calories.

'Unfortunately, there is no silver bullet,' Dr Swithers said.

'Eating food which is naturally low in fat and calories may be a better route than relying on fat substitutes or artificial sweeteners.'

The study was published by the American Psychological Association in the journal Behavioral Neuroscience.

View Full Version: Propaganda against Cholesterol highlighing their

Title: Propaganda against Cholesterol highlighing their
Description: *own nonsense.*

TheUnhivedMind - June 9, 2011 03:43 PM (GMT)

First of all its not been proven that cholesterol raises Heart attacks in fact its known that a lack of cholesterol causes Heart attacks. Now please use logic hear and see how illogic all this nonsense is below. Note how people are putting weight on and this is because they're being scared of the fats your body really needs for fuel. This then forces people onto both carbs and vegetable oils and instead of meats people have soy. The carbs will put weight on you if you don't burn off the excess not used as fuel. The soy and vegetable oils will destroy the Spleen and Thyroid leaving you much unhealthier and on drugs for life. So which sounds better? The meat, cholesterol and saturated fat or the poisons these swines promote today? So as you can see the you're much better off on the old diets. Theres far more Heart disease today than ever yet you're supposed to be doing more healthier things. Its all nonsense. Please remember that oils like Rapeseed actually attack your Heart whilst drugs like statins attack your brain all of course attacking other regions. Remember its all about the amount of Vitamin C in the body along with Vitamin E both tocotreniols and tocopherols along with of course the amino acid Lysine. If levels of these are low then you're in trouble.

QUOTE

Nuclear Industry Will Conduct Post-Fukushima U.S. Safety Review

By Simon Lomax - Jun 9, 2011
http://www.bloomberg.com/news/2011-06-08/h...ls-in-u-k-.html

Lower cholesterol and blood pressure levels helped cut the risk of having a heart attack in the U.K. by 74 percent over two decades, **though rising obesity rates may undermine that progress**, researchers said.

A decline in smoking rates also contributed to the lower risk, according to a study of almost 10,000 civil servants. The findings of the researchers from University College London Medical School were published today in the European Heart Journal.

The reduction in heart attacks would have been even greater if the study participants hadn't also gotten fatter, the researchers found. Between 1985 and 2004, a measure of obesity known as the body mass index rose steadily, and higher obesity rates might have led to an increase in heart attacks if not for the changes in cholesterol, blood pressure and smoking, according to the study.

"Continued increases in BMI may reduce further, and even reverse, the decline in the incidence of heart attacks in the future," said Sarah Hardoon, a senior research associate at UCL who led the study, in a statement. "The rising BMI in the U.K. and in other countries needs urgent attention."

Heart disease remains the world's biggest killer, causing 17.1 million deaths in 2004, the World Health Organization estimates. Behaviors such as lack of exercise, poor diet and smoking account for 80 percent of cardiovascular disease, according to the Geneva-based WHO.

Obesity Rates

Worldwide obesity rates have more than doubled since 1980, and about 1.5 billion people were overweight in 2008, according to the WHO. About 23 percent of the heart disease burden is because of obesity, the WHO said.

Cholesterol is a fatty substance both made by the body and found in some foods. Too much cholesterol in the blood can cause plaque to build up in arteries, blocking the blood supply to the heart and leading to a heart attack.

The greatest single impact on the decline in heart attacks came from lower levels of so-called bad cholesterol, the U.K. study found. That may reflect greater use of a class of cholesterol-lowering medicines as well as changes in diet, the researchers said.

Levels of so-called good cholesterol, which removes bad cholesterol from the blood stream, rose among participants in the U.K. study, further helping to prevent heart attacks.

Cholesterol levels, blood pressure, smoking and diet accounted for more than half of the 74 percent decline, and more research is needed to determine the other factors at work, the researchers said.

The researchers looked at data from more than 9,450 men and women participating in the Whitehall II study, so called because those recruited worked at U.K. government offices in and around Whitehall in London. The study was funded by grants from organizations including the U.K. Medical Research Council, the British Heart Foundation and the U.K. Department of Health.

View Full Version: EATING BUTTER AND CHEESE ‘IS NOT HARMFUL’

Title: EATING BUTTER AND CHEESE ‘IS NOT HARMFUL’

TheUnhivedMind - May 20, 2011 05:54 PM (GMT)

Just make sure that its real butter and cheese and unprocessed crap. Much of the butter sold now in the poison warehouses called supermarkets is mixed with highly dangerous vegetable oils. This is the real problem folks, its not the old foods its the new poisonous forms purposely created and peddled to kill you.

QUOTE

EATING BUTTER AND CHEESE ‘IS NOT HARMFUL’

The scientists concluded that nutrients in dairy food counteract the harmful effects of the saturate

Friday May 20,2011
By Allister Hagger
http://express.co.uk/posts/view/247695/Eat...is-not-harmful-

SPREAD the butter a little thicker on your toast this morning. And if you fancy a tasty hunk of cheese for lunch, go right ahead – there’s no evidence they’ll be bad for your heart, according to the latest research.

Scientists behind the survey dismissed the long-held belief that the saturated fat in dairy food increases the danger of a heart attack.

They studied thousands of middle-aged people and found that even those who scoffed more than a pint of milk or a pound of cheese a day did not seem to increase their risk.

And they concluded that nutrients in dairy food counteract the harmful effects of the saturated fat.

“Things like milk and cheese are very complex substances,” said Stella Aslibekyan of Brown University, Rhode Island, where the research was carried out.

“We looked at heart attack risk and dairy products and then looked at separate components of those dairy products, including fats, and it turns out that the results are null. Perhaps the evidence is not there.”

Her team emphasised that they do not believe the saturated fats in dairy products are harmless.

But they suggested beneficial chemicals such as calcium, vitamin D, potassium and magnesium may protect against heart disease for all but those who eat the largest amounts.

Researcher Dr Ana Baylin likened the nutritional complexity of dairy products to that of eggs. Consumers used to worry about eggs' cholesterol content, but they are now viewed in a more complex way because they, too, have seemingly protective nutrients.

She said: "The message is that it is important to look at the net effect of whole foods and dietary patterns and not only isolated nutrients."

The researchers – whose findings are published online in the journal Nutrition, Metabolism and Cardiovascular Diseases – analysed data on 3,630 Costa Rican men and women who took part in a health study.

They found that the dairy intake of people who had heart attacks was not statistically different to the intake of people who did not.

After studying how much dairy food they ate, there was also no significant link between consumption and heart attack risk, even among the greediest eaters who got through an average of 593 grams a day. The researchers made allowances for factors such as smoking, drinking and physical activity, but still found no significant connection between dairy intake and the risk of a heart attack.

View Full Version: Cooked tomatoes 'as good as statins' for battling

Title: Cooked tomatoes 'as good as statins' for battling
Description: *cholesterol*

TheUnhivedMind - May 20, 2011 05:17 PM (GMT)

Cooked tomatoes 'as good as statins' for battling cholesterol

By Daily Mail Reporter
Last updated at 11:40 AM on 20th May 2011
http://www.dailymail.co.uk/health/article-...holesterol.html

They are common ingredients found in millions of kitchen cupboards.

But pasta sauces and pizza toppings could add much more than a tasty tomato flavour to a family's favourite meals.

Scientists said that cooked tomatoes can have the same benefits as statins for patients battling against high cholesterol levels or high blood pressure.

Healthy: Chemicals found in cooked tomatoes could be effective as statins in fighting cholesterol

They could be an ‘effective alternative’ to statins, the class of drugs commonly prescribed for these conditions which can lead to heart problems, according to a study.

And just two ounces of tomato paste or a pint of juice a day could be enough to help many patients.

The secret lies in high levels of the compound lycopene which gives ripe tomatoes their bright red colour. This powerful anti-oxidant is essential for good health as it helps lower the risk of heart attacks and strokes.

Cooked tomatoes are best as tests showed the body can absorb more lycopene from these than raw fruit.

Experts in Australia analysed the results of 14 international studies into the benefits of lycopene over the past 55 years.

They concluded that it could provide a natural defence to raised levels of so-called ‘bad cholesterol’ – or low-density lipoprotein – in the blood.

The effect was comparable to small doses of statins which are used to treat many of the

2.5million-plus Britons with high cholesterol or blood pressure

GOAT'S MILK, THE SUPERFOOD THAT COULD FIGHT A HOST OF DISEASES

GOAT'S milk is the latest 'superfood' rich in nutrients to be lauded by scientists.

They say it boosts helpful bacteria in the gut and iron levels as well as fighting bone disease, heart disease and brain diseases such as Parkinson's and Alzheimer's.

Goat's milk also has the advantage of being tolerated by people who are allergic to cow's milk.

It can be beneficial as an ingredient in cheese as well as in a drink and joins the list of healthy 'functional foods' including asparagus, olive oil, cranberries and broccoli.

Researchers in Spain found that regular helpings of goat's milk were particularly beneficial to those with iron deficiency but they recommended regular consumption for everyone.

They said it was much more like human milk than cow's milk, with the same kind of healthy properties which breast-fed babies get from their mothers.

And a high content of zinc and selenium combats illnesses such as Alzheimer's and Parkinson's disease,

'Do you take milk with your tea, vicar?'

researchers told International Dairy Journal. Professor Margarita Sanchez Campos, who led the research, said: 'The regular consumption of goat's milk should be promoted.'

These conditions can be a factor in cardiovascular disease, the country's biggest killer.

One of the study's authors, Dr Karin Ried, of the University of Adelaide, said tomatoes have particularly high levels of lycopene.

In the journal Maturitas, she added half a litre of tomato juice or 50 grams of tomato paste daily 'would provide protection against heart disease'.

Eating just one tomato a day would not be enough. Dr Ried said: 'I would really recommend looking at tomato paste. It is very rich in lycopene and it is not difficult to get 50 grams a day in pasta or on a pizza or as a drink. Our study suggests that if more than 25 milligrams of lycopene is taken daily, it can reduce "bad" cholesterol by up to 10 per cent.

‘That’s comparable to the effect of low doses of medication commonly prescribed but without side-effects, which can include muscle pain and weakness and nerve damage.’

Lycopene is also found in watermelon, guava, papaya, pink grapefruit, apricots and rosehip but in lower concentrations.

Title: INQUISITION AGAINST 55YR OLD+ CONTINUES

TheUnhivedMind - May 5, 2011 04:05 PM (GMT)

Study calls for all over 55 to be offered heart drugs

By Dominic Hughes
5 May 2011 Last updated at 11:04
http://www.bbc.co.uk/news/health-13284032

All those over 55 should be offered drugs to lower cholesterol and blood pressure, according to a new study.

The report says that when assessing the risk of heart problems, offering treatment to all over-55s had the same results as testing for cholesterol or blood pressure problems.

The authors also argue it would be more simpler and cost effective.

But the Department of Health says the focus of the study is too narrow and ignores other health problems.

Writing in the open access journal PLoS ONE the authors, from the Wolfson Institute at Barts and the London Medical School, said age was by far the biggest factor in assessing someone's risk of cardiovascular disease such as heart attack or stroke.

They compared the effects of two screening programmes on a theoretical population of 500,000 people.

The first approach used screening just by age, where, at the age of 55, people would be offered preventive treatment, regardless of whether they were at risk.

The second approach used existing screening methods, based on age and sex, and whether someone was a smoker or has high blood pressure or cholesterol.

They found that both approaches had an 84% detection rate, but that offering everyone preventive treatment at 55 would be more cost effective.

The two methods also had a broadly similar false-positive rate - in other words, using age alone would diagnose 24% of people as being at risk, when in fact they would not go on to develop heart problems.

Existing methods of screening identified 21% of false-positives.

If screening by age alone was introduced, the authors believe it could prevent as many as 100,000 heart attacks and strokes each year in England and Wales alone.

Professor Sir Nicholas Wald is the lead author of the report and Director of the Wolfson Institute.

He said: "This study shows that age screening for future cardiovascular disease is simpler than current assessments, with a similar screening performance and cost effectiveness. It also avoids the need for blood tests and medical examinations.

"With age screening, all individuals above a specified age would be offered preventive treatment. Everyone would benefit because, for blood pressure and cholesterol, the lower the better.

"The policy of selecting people above a certain age is, in effect, selecting people at high risk. It recognises that age is by far the most important determinant of that risk with other factors adding little extra prognostic information.

"Prevention is better than measurement. Identifying people at high risk of cardiovascular disease needs to be greatly simplified, enabling people to obtain easy access to preventive treatment from nurses and pharmacists as well as from doctors."

Professor Nicholas Wald, director of the Wolfson Institute, and GP Dr Rosemary Leonard, debate using age as an indicator to start taking statins
Other factors

But the British Heart Foundation said other risk factors in addition to age needed to be taken into account when it came to assessing the future risk of heart and circulatory problems.

Natasha Stewart, senior cardiac nurse at the British Heart Foundation, said the research showed similar results to other more detailed risk assessments in an older population.

"But vitally it would miss younger people in higher risk groups such as those with a family history of heart disease, people of South Asian origin and people with diabetes.

"Because this model is cheaper it may be useful for a widespread screening programme. But it's essential that we continue full risk assessments for younger people who may be at significant risk of getting heart and circulatory disease.

"Recognising and treating other risk factors such as high cholesterol and high blood pressure in people aged 40 to 55 could prevent them from developing heart and circulatory disease in the first place, which is the best outcome for them and makes economic sense for the NHS too."

A statement from the Department of Health also sounded a note of caution.

"This study looked at the risk of cardio-vascular disease alone - a narrower focus than the NHS Health Check programme, which also identifies those at risk of diabetes and chronic kidney disease.

"That's why we start risk assessment at age 40. Blood pressure, cholesterol, height, weight and whether people smoke are all considered. This group of simple measurements, along with age, sex and ethnicity, are used to assess risk.

"The NHS Health Check programme is based on evidence of how to measure and tackle risk - and underpinned by modelling that demonstrates it is clinically and cost effective.

"However, we agree that we must focus on prevention. That is why we are putting in place a public health service to give local people the money and the power to improve our nation's health.

"And as part of Change4life we are encouraging people to make simple changes, such as eating more fruit and vegetables and being more active."

More Saturated Fat Attacks

Written by Mary Enig, PhD
Tuesday, June 23 2009 18:12
http://www.westonaprice.org/know-your-fats...ted-fat-attacks

Butter consumption has been rising over the last few years—not by leaps and bounds, but steadily upward—both in the U.S. and in Europe. This shift in consumption patterns may explain a resurgence of anti-saturated fat messages in the U.S. and overseas.

Britain launched a “health” campaign in February of 2009 to “raise awareness of the health risks of eating too much saturated fat,” and lamenting the fact that “the UK is currently eating 20% more saturated fat than UK Government recommendations.”

The highly coordinated campaign includes a 40-second TV advertisement in which a "jug of saturated fat is poured down the sink, overloading and blocking a kitchen pipe to vividly bring to life the message that too much saturated fat is bad for your heart.” Print ads encourage Britons to cut the fat off their meat, switch to lower-fat dairy products and use vegetable oils instead of butter when cooking.

In New Zealand, newspaper articles have urged the population to eat less bacon and sausage, avoid butter and pastries containing butter, and take children off of full-fat milk after the age of two “to avoid clogging their arteries.”
In the U.S.

As Americans are increasingly turning again to real food, newspaper articles have appeared praising the virtues of real butter, fatty meats and lard. A breakthrough was an article entitled “Dieting? Don’t fear the fat,” by Allison Boomer, published in the Boston Globe (January 7, 2009). Noting that fats provide satiety she writes, “You might feel quite satisfied, for instance, if you crumble two slices of crisp bacon and one ounce

of cheese on your salad or eat that delectable golden skin on your broiled chicken. No one is advising you to eat mountains of fries or other foods made with commercially processed fats. The suggestion is a judicious amount (about 1 tablespoon per meal) of naturally occurring fats. Think of butter, cheese, chicken or duck fat, even well-marbled steaks, as a taste-enhancing complement to a meal." Five years ago, no major newspaper would have published anything along the lines of this common-sense advice. Boomer's article is a sign that the walls of the lowfat dungeon are crumbling.

Thus, in the U.S., the anti-saturated fat campaign has become more subtle, consisting not of blatant propaganda - the kind of finger wagging food Puritanism that is increasingly turning us off- but of spin-doctored reports on scientific studies.
Saturated Fat and the Liver

One example is a study entitled "Saturated Fatty Acids Promote Endoplasmic Reticulum Stress and Liver Injury in Rats with Hepatic Steatosis," published in Endocrinology (2006 147;(2):943-951).

In this study, markers for liver function worsened in rats on a diet high in sucrose (68 percent sucrose, 12 percent corn oil and 20 percent casein) or high in lard (45 percent lard oil, 35 percent corn starch and 20 percent casein) compared to a high starch diet (68 percent corn starch, 12 percent corn oil and 20 percent casein) or a high polyunsaturated diet (35 percent corn starch, 45 percent corn oil and 20 percent casein). The lard oil diet was described as high in saturated fat, hence the title of the study, which fingers saturated fatty acids. The title contains no mention of the similar adverse effects from the high sucrose diet; but even worse is the characterization of lard oil as high in saturated fat. The definition of lard oil is "oil consisting chiefly of olein that is expressed from lard." Olein is a glyderide of oleic acid; that is, oleic acid joined to a glycerol molecule. Thus the diet described as high in saturated fatty acids was actually high in monounsaturated fatty acids! (None of the diets could be called normal diets.)

It would be surprising if saturated fats caused liver problems in experiments like these because for sixty years, research has shown that saturated fats protect the liver. A recent study, published in the Journal of Nutrition (145:904-912, April, 2004) found that saturated fat from beef tallow reduced alcoholic liver toxicity in rats whereas corn oil increased markers of liver toxicity. Moral: If you drink, eat plenty of butter and fatty meats.
Saturated Fats in Pregnancy Diet

More spin doctoring comes with a November, 2008 study published in the Journal of Clinical Investigation (doi:10.1172/JCI32661) which compared the results of two diets fed to pregnant monkeys. One group got a "healthy" diet of fruits, vegetables and 15 percent fat. The other group got a high-calorie junk food diet with 35 percent of calories as fat, and which, according to a news report, included potato chips, peanut butter and

chocolate. (A description of the diet does not appear in the scientific report.) In the latter group, fatty liver disease developed in the fetuses that were sacrificed for testing, and the offspring allowed to be born became obese.

The obvious conclusion of this study is that a junk diet, high in sugar and processed vegetable oils, during pregnancy will adversely affect the offspring. But according to a public statement by Professor Jacob Friedman, one of co-authors, the study “implicates the saturated fat in the diet as the culprit.” Yet there was twice the level of unsaturated fat as saturated fat in the junk food diet. The study was funded by grants from the National Institutes of Health, which is firmly wedded to the hypothesis that saturated fats are the cause of chronic disease. Obviously, Dr. Friedman has funding for future studies in mind.
Blood Vessel Inflammation

Another saturated fat attack comes from a February, 2009 study published in the American Heart Association journal Circulation Research entitled "Proinflammatory Phenotype of Pervascular Adipocytes: Influence of High-Fat Feeding.” The researchers found more markers of vascular inflammation in mice placed on a "high- fat Western diet.” But nowhere in the article or the accompanying press release do the authors disclose the type of fat fed to the mice.

After an email query, Neil Weintraub, the principal study author, provided us with the feeding formula they used—the fat used was indeed an animal fat, what the industry calls anhydrous milk fat; that is, butterfat with most of the moisture removed. The other main components of the formula were casein (20 percent by weight), sucrose (34 percent by weight) and corn starch (15 percent by weight) - all problematic ingredients that could have contributed to inflammattion. As there was no control group fed the same formula but with polyunsaturated oil instead of anhydrous milk fat, the researchers could make no comparison of the effects of mostly saturated versus mostly polyunsaturated fatty acids.

And anhydrous milk fat may not have the same fatty acid profile as butter. The industry has figured out how to add polyunsaturated fatty acids to milk fat through enzymatic interesterification. Weintraub believes that his results prove that “high-fat diets” can predispose individuals to heart disease even if they do not have high cholesterol levels. “. . . many patients who consume high fat diets do not exhibit abnormal lipid profiles but still develop atherosclerosis nonetheless. These new findings suggest a direct link between poor dietary habits and inflammation of blood vessels. . .”

The study was again funded by the National Institutes of Health, which preaches that “poor dietary habits” mean consumption of foods like meat, butter and cheese, high in saturated fat.
Watching Closely

Why would the industry be concerned about a small group of people returning to butter, lard and other real foods? Because even small changes in consumption patterns can wreak havoc in an industry geared to foods based on vegetable oils. And the industry knows that small trends soon become big trends.

And the industry is watching carefully. A February, 2009 article published in the Journal of the American Dietetic Association (109(2):288- 96) entitled “Americans’ awareness, knowledge, and behaviors regarding fats: 2006-2007,” looked at consumer awareness and understanding of trans and other fats. The researchers found that during the study period awareness of trans fats had increased to the same level as awareness of saturated fat (92 and 93 percent respectively). But knowledge of food sources of trans fats remained low. Only 21 percent could name three food sources of trans fats in 2007, compared to 30 percent who could name three food sources of saturated fat.

Of course the industry would like for consumers to remain ignorant about which foods contain trans fats. Saturated fats are likely to be highly visible as butter, cream or fat on meat, whereas trans fats are hidden in the batter, dough and crust of chicken nuggets, cookies, crackers, chips and other junk foods. The current campaign to warn the public about trans fats always mentions saturated fats as a threat in the same breath, and since consumers recognize saturated fat much more easily than trans fat, the warnings about unhealthy trans fats often result in avoidance of healthy saturated fats.

Likewise, articles implicating “high-fat diets,” such as the one appearing in Circulation Research, also have the effect of scaring people away from visible butter and meat fats while encouraging the continued consumption of invisible fats and oils in processed and fried foods. And many people will assume that liquid oils are fine - after all, they are not usually referred to as fats. Since people know what saturated fats do to the pipes under the kitchen sink, they are likely to fall for the simplistic argument that saturated fats do the same thing in the human body—never mind the fact that your body is at least twenty-five degrees warmer than those fat-clogged pipes.

The vegetable oil industry and its cohorts in the scientific community choose their words and images carefully!

This article appeared in Wise Traditions in Food, Farming and the Healing Arts, the quarterly journal of the Weston A. Price Foundation, Summer 2009.

Title: More Good News on Coconut Oil

TheUnhivedMind - May 1, 2011 11:52 PM (GMT)

More Good News on Coconut Oil
Written by Mary G. Enig, PhD
Monday, December 18 2006 14:20

One of the most serious and intractible medical problems facing doctors today is that of antibiotic-resistant infectious microorganisms, the so-called "superbugs." One example is MRSA (methicillin-resistant Staphylococcus aureus), now a common source of blood poisoning and infection in hospitals (see sidebar below). Other exampless of antibiotic-resistant infectious agents include Bacillus anthracis Sterne, virulent Escherichia coli, Klebsiela pneumoniae, Helicobacter pylori, and Mycobacterium terrae, viruses with lipid membranes, and a number of invasive fungi.

This problem has led to interest in researching the use of natural products to enhance the treatment of infectious disease, such as coconut oil and other oils rich in lauric acid as well as herbal remedies like originum oil, substances traditionally recognized for decades for their healing properties. While there have been many testimonies--so-called "anecdotes"--about the effectiveness of such natural treatments, until recently no published studies were available to doctors that would allow them to justify their use of these protocols.

Fortunately coconut oil and other lauric oils, as well as oregano oil, have recently been the object of study in the Georgetown University laboratory of Dr. Harry Preuss in the United States and this research has resulted in several published peer reviewed papers appearing in toxicology journals in 2005.

The antimicrobial properties of both volatile aromatic oils such as originum (oregano) oil and medium chain fatty acids such as lauric acid and its derivative monolaurin from coconut oil have shown promise in these studies. As noted by these researchers, origanum oil, used as a food-flavoring agent, possesses a broad spectrum of antimicrobial activity due, at least in part, to its high content of phenolic derivatives such

as carvacrol and thymol. Also, lauric acid, which is present in heavy concentrations in coconut oil, forms monolaurin in the animal body and this derivative of lauric acid can inhibit the growth of many pathogenic microorganisms.

Part of the research focused on Staphylococcus aureus. In vitro studies were performed on two strains of Staphylococcus aureus and this was followed by in vivo studies in mice. The effects of monolaurin and originum when used in combination were better than the most potent antibiotic and this research showed that these safe antimicrobial agents could be useful for prevention and therapy of Staphylococcus aureus and numerous other infections.

It is now clear and scientifically validated that the inclusion of coconut oil in the diet could and should be utilized for its preventive and healing properties.
Resistant pathogens

Staphylococcus aureus (colloquially known as "Staph aureus") is one of the major resistant pathogens. Found on the mucous membranes and the skin of around a third of the population, it is extremely adaptable to antibiotic pressure. It was the first bacterium in which penicillin resistance was found--in 1947, just four years after the drug started being mass-produced. Methicillin was then the antibiotic of choice. MRSA (methicillin-resistant Staphylococcus aureus) was first detected in Britain in 1961 and is now "quite common" in hospitals. MRSA was responsible for 37 percent of fatal cases of blood poisoning in the UK in 1999, up from 4 percent in 1991. Half of all S. aureus infections in the US are resistant to penicillin, methicillin, tetracycline and erythromycin.

This left vancomycin as the only effective agent available at the time. However, VRSA (Vancomycin-resistant Staphylococcus aureus) was first identified in Japan in 1997, and has since been found in hospitals in England, France and the US. VRSA is also termed GISA (glycopeptide intermediate Staphylococcus aureus) or VISA (vancomycin insensitive Staphylococcus aureus), indicating resistance to all glycopeptide antibiotics.

A new class of antibiotics, oxazolidinones, became available in the 1990s, and the first commercially available oxazolidinone, linezolid, is comparable to vancomycin in effectiveness against MRSA. Linezolid-resistance in Staphylococcus aureus was reported in 2003.

Enterococcus faecium is another superbug found in hospitals. Penicillin-Resistant Enterococcus was seen in 1983, Vancomycin-Resistant Enterococcus (VRE) in 1987, and Linezolid-Resistant Enterococcus (LRE) in the late 1990s.

Penicillin-resistant pneumonia (or pneumococcus, caused by Streptococcus pneumoniae) was first detected in 1967, as was penicillin-resistant gonorrhea. Resistance to penicillin substitutes is also known beyond S. aureus. By 1993 Escherichia coli was resistant to five fluoroquinolone variants. Mycobacterium

tuberculosis is commonly resistant to isoniazid and rifampin and sometimes universally resistant to the common treatments. Other pathogens showing some resistance include Salmonella, Campylobacter, and Streptococci.

In November, 2004, the Centers for Disease Control and Prevention (CDC) reported an increasing number of Acinetobacter baumannii bloodstream infections in patients at military medical facilities in which service members injured in the Iraq/Kuwait region during military operations in Iraq and Afghanastan were treated. Most of these showed multidrug resistance (MRAB), with a few isolates resistant to all drugs tested (http://en.wikipedia.org/wiki/Antibiotic_resistance).

TheUnhivedMind - May 1, 2011 11:51 PM (GMT)

Some Additives in Vegetable Oils

Written by Mary Enig, PhD
Friday, April 03 2009 09:28
http://www.westonaprice.org/know-your-fats...-vegetable-oils

We often hear people say that they consume vegetable oils and avoid animal fats because “animal fats are full of pesticides.” Some animal fats do test high in pesticides, notably butterfat in conventional milk, cheese and ice cream and certain types of seafood, especially catfish, lobster and mollusks. However in a recent survey, soy bean oil tested almost as high in DDT, TDE and DDE as milk fat. (Conventionally grown potatoes, sweet potatoes and carrots also tested high; fish contained levels four times greater than those in butterfat.1)

By now you know that consumption of vegetable oils is associated with many health problems, from cancer and heart disease to growth problems and learning disabilities in children. The answer to the problem of pesticides in animal fats is not to replace them with vegetable oils but to avoid commercial versions of these animal foods and choose pasture-raised, or at least organically raised, versions instead. And, as we have pointed out in these pages, vitamin A from animal fats and organ meats provides powerful protection against dioxins.2
Hexane

One thing you will not find in animal fats like butter, egg yolks and meat fat is hexane. This food-grade gasoline is the dominant solvent used in oilseed extraction throughout the world. It is very volatile, flammable and explosive—causing many explosions and fires in vegetable oil plants, and even a few in fast food fryers.

The EPA now categorizes hexane as a HAP (hazardous air pollutant), included on the list of 189 toxic chemicals. Inhalation of hexane can damage the nervous system,

leading to numbness in the hands and feet, followed by weakness in the feet and lower legs. Paralysis may develop with continued exposure. Most at risk are those working in closed industrial facilities with hexane- containing solvents and glues. At very high levels of hexane in the air, signs of damage to sperm-forming cells in male rats occur.3

But the big question for the average consumer concerns the effect of hexane when it is ingested. Government and industry have tended to gloss over potential problems. “Because cooking oils are processed with solvents containing hexane, very small amounts may be present in these products. However, the amounts in cooking oil are too low to have any effect on people.”4

As for whether hexane causes cancer, of- ficial statements show a similar lack of concern: “There is no evidence that exposure to hexane increases the risk of cancer in people. No reliable information is available on whether hexane causes cancer in animals.”5 This is because very few studies have been carried out to determine the carcinogenicity of hexane. One of the few did find an increase in liver cancer in female mice after exposure for two years; no increase was found in male mice or in rats of either sex.6

And there may be other adverse effects. According to the Material Safety Data Sheet for Hexane, the substance is “Harmful or fatal if swallowed.” Ingestion may produce abdominal pain, nausea and symptoms that parallel those of inhalation, including “lightheadedness, nausea, headache and blurred vision. Greater exposure may cause muscle weakness, numbness of the extremities, unconsciousness and death.” Interestingly, one fact sheet on hexane lists high blood sugar as a toxic effect.7 Gastroparesis (literally, paralysis of the stomach, in which the stomach cannot churn and digest food) is another reported effect.8

In 1997, researchers using a new technology found higher-than-expected levels of pentane, hexane, heptanes, octane and benzene derivatives in all six hexane-extracted samples of cooking oils tested.9 This means that humans may be ingesting greater amounts of these petroleum derivatives than previously thought.

And it means that animals are ingesting higher levels also. Hexane levels in solvent-processed vegetable oil residue used for animal feed can run as high as 0.5 percent, enough to create a known mild toxicity that precludes the use of solvent-extracted meal in a number of markets, such as pig feeding. (It kills baby pigs, whose digestive tracts are similar to those of humans.)10

Those consuming solvent-extracted commercial vegetable oils every day—and that includes all fried food like French fries and Chicken McNuggets, commercial salad dressings, and cooking oils—are subjecting themselves to longterm chronic exposure, the effects of which are anybody’s guess.
Antioxidants

Because processing of fragile vegetable oils creates free radicals and other highly reactive breakdown chemicals, these products require the addition of potent antioxidants like BHT, BHA and—the latest entry—TBHQ. A list of adverse effects from these substances includes cancer in various sites, liver toxicity, kidney and bladder toxicity, depression of thyroid function, and changes in behavior.11 TBHQ, in particular, makes test animals susceptible to stomach tumors and causes damage to DNA.12

An internet search reveals reports of behavior changes in children, including decreased concentration and learning ability and “screaming fits, teary, really temperamental, like world war three, and waking at night,” on exposure to unlabeled BHA and TBHQ.13 These additives are also found in commercial lard and beef tallow, so purchase these from a farmer you know and trust! The presence of hexane and powerful antioxidants provides yet more reasons to avoid vegetable oils and products made with them.

An Example of Junk Science

Written by Mary G. Enig, PhD
Saturday, June 24 2006 14:24
http://www.westonaprice.org/know-your-fats...of-junk-science

While the establishment is finally recognizing the dangers of trans fatty acids, conventional dietary gurus continue to warn the public about the alleged dangers of saturated fats. In this article, we will look at a study published in 1997 in the American Journal of Cardiology (79:350-354) used to justify avoidance of red meat and butterfat, the two main sources of saturated fatty acids in the Western diet.

Arthur Agatston, author of the best-selling South Beach Diet refers to this research when he states: "The major problem I have with the Atkins Diet is the liberal intake of saturated fats. There is evidence now that immediately following a meal of saturated fats, there is dysfunction in the arteries, including those that supply the heart muscle with blood. As a result, the lining of the arteries (the endothelium) is predisposed to constriction and clotting. Imagine: Under the right (or rather, wrong) circumstances, eating a meal that's high in saturated fat can trigger a heart attack! In addition, after a high-fat meal certain elements in the blood called remnant particles, persist for longer than is healthy. These particles contribute to the buildup of plaque in the vessel wall." Agatston recommends consuming polyunsaturated and monounsaturated vegetable oils, including tub spreads, rather than animal fats like butter.

In the study, carried out by Robert A. Vogel and his team at the University of Maryland School of Medicine, ten volunteers were tested for "endothelial function" by measuring the diameter change in the brachial artery using ultrasound after a high-fat and a lowfat meal, each of 900 calories.(The endothelium is the lining of the arteries.) The high-fat meal contained 50 grams of fat and the lowfat meal contained--according to the authors--0 grams of fat. (Actually, no food is completely devoid of fat, even skim milk.)

"Flow-mediated vascularity" did decrease more in the high-fat group compared to the lowfat group. Interestingly, LDL-cholesterol declined slightly for both groups but in the lowfat
group, the so-called good HDL-cholesterol also declined, whereas it remained stable in the high-fat group. Blood pressure declined in the high-fat group, but rose in the lowfat group. Most significantly, blood glucose rose in the lowfat group, but declined slightly and then returned to baseline in the high-fat group.

For years we have been hearing that high-fat foods raise so-called bad LDL-cholesterol and blood pressure and therefore contribute to heart disease. But since that didn't happen in this study, the authors have declared that an inherently subjective measurement of "endothelial function" is a better marker for heart disease.

But was it saturated fat that caused the decline in endothelial function? The high-fat meal consisted of an egg McMuffin, sausage McMuffin, two hash brown patties and a noncaffeinated beverage. The lowfat meal consisted of Frosted Flakes, skimmed milk and orange juice. According to the authors, the high fat meal contained 50 grams of fat, of which 14 were saturated fat. So only 28 percent of the fat in the high-fat meal was saturated. The rest was a combination of trans fats, monounsaturated and polyunsaturated fat, any one of which, or all together are the likely culprits in the decline in endothelial function. But Agatston (along with the study authors) blames the adverse effects on saturated fats!

The lowfat meal that won the endothelial-function contest is obviously a terrible meal--extremely high in sugar and devoid of nutrients. Yet it does have one thing going for it--it is unlikely that Frosted Flakes, skim milk or orange juice contain MSG, whereas the high-fat meal certainly contained MSG in the sausage and hash browns. If the bread contained soy, which it probably did, this would be another source of MSG. The presence of MSG in the high-fat meal provides a likely explanation for the decline in endothelial function.

The subjects in this study ate junk food and the research itself can only be described as junk. The study was designed so poorly that no conclusions can be drawn from it. In order to test the effects of saturated fat on endothelial function, the researchers should have provided two identical meals of simple whole foods, except for the addition of a mostly saturated fat such as suet or coconut oil to one of the meals. Then, to compare the effects of the various fats with saturated fat, the researchers should have repeated the experiment adding a mostly monounsaturated fat, such as olive oil, to one of the meals, a high-trans fat such as vegetable shortening and finally a polyunsaturated fat such as corn oil.

To correlate their findings--temporary decline in endothelial function--with long-term effects such as heart disease, the authors should have been able to cite numerous

studies; but they cite only one, which postulates a chronic decline in endothelial function with atherosclerosis. They provide no evidence that the temporary decline in endothelial function observed in this study is associated with atherosclerosis in the long term or can "trigger a heart attack."

As it becomes more and more obvious that cholesterol levels have little predictive value for heart disease--and that saturated fats in fact have little or no effect on cholesterol levels anyway--researchers are searching for other ways to demonize saturated fats. The study carried out by Vogel and his team can only be characterized as "garbage in, garbage out," a "grasping-at-straws" attempt to stem the change in consumer eating habits towards real, whole foods.

Title: A Response to the National Association of Margarin
Description: *Manufacturers [POISONERS]*

TheUnhivedMind - May 1, 2011 11:49 PM (GMT)

A Response to the National Association of Margarine Manufacturers

Written by Mary Enig
http://www.westonaprice.org/know-your-fats...ne-manufactures

In July, the Weston A. Price Foundation received a letter from the National Association of Margarine Manufacturers (NAMM), which takes issue with statements about margarine on our website, www.westonaprice.org. Richard Cristol, president of the organization, specifically singles out a statement in the article “Cholesterol: Friend or Foe?” by Natasha Campbell-McBride, MD: “Skin cancer, blamed on sunshine, is not caused by the sun. It is caused by trans fats from vegetable oils and margarine and other toxins stored in the skin. In addition, some of the sunscreens that people use contain chemicals that have been proven to cause skin cancer.”
Margarine and Cancer

It was my work for my doctorate that first uncovered the link between trans fats and cancer. In studies with rats, I was able to show that trans fats interfere with the cytochrome 450 enzyme system.1 This enzyme system plays many roles, one of which is to help our body detoxify and get rid of carcinogens. I was later able to show, using the same government data available to the Senate Select Committee on Dietary Goals (the McGovern Committee), that consumption of margarine and vegetable oils is associated with more cancer, not less, as the Committee claimed in its final report, and that consumption of traditional fats like butter was associated with less cancer.2

Early studies on fat consumption patterns are useless for shedding light on the butter versus margarine debate because scientists were using databases that did not list trans fats; often trans fats were labeled as saturated fats in these databases. 3 When they found a relationship between saturated fat consumption and cancer, traditional fats like

butter, tallow and coconut oil got the blame. In reality these mostly saturated fats were tarred with the black brush of trans fats found in margarines and shortenings.

Numerous studies have shown that exposure to sunlight can help protect us against many kinds of cancers,4 and that vitamin D deficiency is associated with increased risks of deadly cancers.5 There is still much debate over the role of sunlight and melanoma—in fact just such a debate was published in the July 22, 2008 issue of the British Medical Journal, with evidence presented supporting both sides of the debate.6 Thus Dr. Campbell-McBride is not alone in her opinion that sunlight does not contribute to malignant skin cancer.

As for the generally non-malignant type of skin lesions referred to as basal cell and squamus cell carcinomas, these we know are associated with exposure to sunlight, but there are other factors involved. These lesions occur when “DNA repair of ultraviolet light damage is impaired.”7 Trans fats are a likely dietary factor that would impair DNA repair of ultraviolet light damage. Once trans fats are built into the cell membranes of the skin, many reactions cannot take place, including those involved in DNA repair.

The letter from NAMM also states that “Margarine has never been shown to increase the risk of cancer.” Until recently, the margarines that people used most certainly did increase the risk of cancer because they contained significant amounts of trans fats.

Given the great controversy over trans fats, it is a remarkable fact that very few studies have been carried out specifically comparing cancer rates in margarine eaters versus butter eaters. Often all fats are lumped together in epidemiological or case control studies—margarine with butter, lard and other fats.8 One study divided participants into four dietary patterns: “healthy” (vegetables, fruit, yogurt, sea products and olive oil); “Western” (potatoes, pizzas and pies, sandwiches, sweets, cakes, cheese, cereal products, processed meat, eggs and butter); “drinker” (sandwiches, snacks, processed meat and alcoholic beverages); and “meat eaters” (meat, poultry and margarine).9 Studies so poorly designed tell us absolutely nothing about the relative risks of margarine versus butter. In this study, those on the “Western” diet had a higher risk of colorectal cancer, which allows the researchers to blame butter and exonerate margarine. But the “Western” diet was certainly higher in trans fats from pizzas, pies, sandwiches (mayonnaise and bread), sweets and cakes.

An exception to the lack of useful results from research on butter and margarine is a study by Japanese researchers published in Cancer Detection and Prevention, 1994.10 Rats with mammary tumors induced by a carcinogen were alternately fed butter and margarine. Margarine caused an increase in both the incidence and the number of mammary tumors, and this increase was dose dependent. On the other hand, butter did not show any tumorenhancing effects.
Trans Fats in Margarine

NAMM argues that “Margarine is no longer high in trans fat.” A quick perusal at the grocery store reveals that the average margarine—yes, there is still plenty of margarine for sale at grocery stores—contains 2-2.5 grams trans fats per 11 grams of fat, so 18-23 percent of the fat in margarine is trans fat.

And the new “low-trans” spreads are not completely free of trans fats. New labeling laws allow “contains 0 grams trans fat” on the label when the product contains less than .5 grams trans fat per serving containing 11 grams of fat, which means that it can contain up to 5 percent trans and still carry this deceptive label. Remember that government scientists have declared trans fats to be unsafe at any level.

And there are hidden sources of trans fat. Mono- and di-glycerides do not have to be listed as fats. Yet they are fats—just like triglycerides. And they are always partially hydrogenated. Also, many of the liquid oils used in margarines and spreads are deodorized, a brush hydrogenation process that creates small amounts of trans fats.

Soft spreads labeled “no trans” are based on liquid vegetable oils, which are always full of dangerous free radicals, known to cause cancer. Other ingredients in soft spreads include the preservative EDTA, citric acid (a source of MSG), artificial flavors and crushed soybeans.
Saturated Fat

The margarine industry promotes margarine as better than butter because “Today’s typical margarine has 2 grams or less of saturated fat compared to 7 grams of saturated fat in butter, and most margarine products are significantly lower in calories than butter.” The implication is that saturated fats are bad, a claim that is totally untrue; however, this claim has served to demonize the competition and convince the general population to abandon traditional healthy fats. As shown in the chart below, saturated fats have the opposite effects of trans fats, and these effects are beneficial, whereas the effects of trans fats are harmful.

As for calories, butter and hard margarines are identical at 108 calories per tablespoon; soft margarines have 100 calories per tablespoon because they contain more water. A savings of eight calories per tablespoon is hardly worth the risk of eating a manufactured soft spread rather than a natural fat like butter!
Website Information

The NAMM letter castigates us for “inaccurate” and “misleading” information on our website. “[A]nyone who believes this nonsense may be lead [sic] to substitute products for margarine that are very high in saturated fat, thus increasing their risk of heart disease.” Yes, our information is designed to lead people to use butter instead of margarine; we have provided a wealth of scientific information to show that butter is an especially healthy food and that replacing margarine with butter lowers the risk of heart disease.

Speaking of misleading websites, let's have a look at www.margarine. org, the website of the National Association of Margarine Manufacturers. There we find all the inaccurate, misleading and unscientific misinformation that the vegetable oil industry has promulgated over the last fifty years. The crime of saturated fat, according to the website, is that in certain studies, saturated fat temporarily raises the so-called bad cholesterol. This is a surrogate endpoint, and a totally meaningless one. Margarine eaters have more heart disease than butter eaters11 and epidemiological data show that heart disease is lower in countries where saturated fat consumption is high, as shown in the graphs below.

Mr. Cristol is concerned that the information on our website "is significantly damaging to an industry that has worked diligently to deliver healthy products to the consumer." The truth is, margarines and spreads are not healthy; people need to stop eating them and return to real, whole foods.
Partners in Crime

Next Mr. Cristol admonishes us to visit the websites of the FDA, the American Heart Association and the National Heart, Lung and Blood Association. These organizations have been partners in crime with the vegetable oil industry for many years. Promotion of margarine over butter is a national policy, thanks to the backroom manipulations of the industry's lobbying organization, the Institute for Shortening and Edible Oils. This story is told in detail in my article "The Oiling of America," posted at www.westonaprice. org

Mr. Cristol tells us that he will be monitoring our site to see that we remove any "false, misleading and pejorative" postings. We wonder whether the NAMM has any plans to remove the false, misleading and pejorative postings about butter on its own website.

Fortunately, it is no crime to tell the truth, as we have always done at the Weston A. Price Foundation. We will continue to inform the public about the health benefits of traditional fats and of dangers of highly processed foods like margarine and spreads. They are not fit to be consumed by man or beast.

TheUnhivedMind - May 1, 2011 11:49 PM (GMT)

Saturated Fats and the Lungs

Written by Mary G. Enig, PhD
Friday, June 30 2000 14:34
http://www.westonaprice.org/know-your-fats...s-and-the-lungs

Yes fat? No fat? High fat? Low fat? Wrong questions! A better question would be, how much of what kind of fat and why? Yes, we need added fat in our diets or we lose the synergistic effects from the natural fats in our foods. Such fats provide us with appropriate satiety signals; they ensure absorption of important fat-soluble vitamins, phytonutrients and important minerals; and they provide the raw material for skin health, hormone production and adequate energy storage.

The use of lowfat diets is increasingly recognized as counter productive. Without good quality fat in the diet to promote proper satiety signals, we tend to overeat those foods that are readily available. And since "readily available" foods are either high in simple carbohydrates or partially hydrogenated fats and oils or both, and since these foods promote insulin resistance, it is easy to head in the direction of obesity.

Saturated fats have gotten a bad rap. For 30 to 40 years, they have borne the brunt of an anti-fat campaign. This campaign was promoted by individuals in the fats and oils part of the food industry who had great influence over government agencies, consumer groups and the media.

Recommendations about fat in the diet made by government agencies such as the USDA, the FDA, the National Heart, Lung and Blood Institute, organizations such as the American Heart Association and consumer activist groups such as Center for Science in the Public Interest invariably paint saturated fat as the one bad actor in the diet that needs to be fired from the scene.

The spokespersons from these organizations don't understand the effects of the saturated fatty acids found in the diet and they don't understand how much and where saturated fatty acids are normally found in the human body. Everything these organizations report about fat is based on what they perceive to be the effects of saturated fatty acids on serum cholesterol levels.

So when a particular fat raises the level of the body's repair substance, which is what cholesterol is, the question that really should be asked is whether this is good because the body will now get the repair substance it needs, or whether it could be bad if getting more of the repair substance triggers the need for repair. The former makes sense, the latter does not. A well-known New York pathologist, Meyer Texon, MD, noted that accusing fat and cholesterol of causing the injury that led to the atheroma is akin to accusing the white blood cells of causing infection; they are both there to help repair.

We need natural saturated fat in our diets. The important phospholipids that form the membranes in all of our cells are made of mostly (half or more) saturated fatty acids. This is especially true for parts of our brains where more than 80 percent of the phospholipids carry half of their fatty acids as saturated fatty acids.

When it comes to our lungs, the very important phospholipid class called lung surfactant is a special phospholipid with 100 percent saturated fatty acids. It is called dipalmitoyl phosphatidylcholine and there are two saturated palmitic acid molecules attached to it. When people consume a lot of partially hydrogenated fats and oils, the trans fatty acids are put into the phospholipids where the body normally wants to have saturated fatty acids and the lungs may not work effectively. Some research has suggested that trans fatty acids are causing asthma in children.

Recent research shows that having enough saturated fat prevents stroke; and to protect our kidneys from disease, research shows we need certain kinds of saturated fatty acids, which are found only in the natural fats such as animal fats and coconut and palm kernel oils.

Saturated Fats and the Kidneys

Written by Mary G. Enig, PhD
Saturday, September 30 2000 14:31
http://www.westonaprice.org/know-your-fats...and-the-kidneys

Read this article in: Danish

One of the body's most important organs is the kidney. Properly functioning kidneys are essential for maintaining proper blood volume and composition; for filtering and excreting or saving various chemical metabolites; and for helping to maintain proper blood pressure. Hypertension (high blood pressure) is known to result from improperly functioning kidneys. Research carried out during the last few years indicates that both saturated fat and cholesterol play important roles in maintaining kidney function, as do the omega-3 fatty acids.

The kidneys need stable fats both for their cushioning and as their energy source. We know that the kidney fat normally has a higher concentration of the important saturated fatty acids than are found in any of the other fat depots. These saturated fatty acids are myristic acid (the 14-carbon saturate), palmitic acid (the 16-carbon saturate), and stearic acid (the 18-carbon saturate). When we consume various polyunsaturated fatty acids in large amounts, they are incorporated into kidney tissues, usually at the expense of oleic acid, because the normal high level of saturated fatty acids in the kidney fat does not change.1

A species of rat known to be prone to strokes and to spontaneously develop hypertension (high blood pressure) has been used to evaluate effects of different lipids such as plant sterols or cholesterol, and also fatty acids such as omega-3 or omega-6 fatty acids in the finely tuned functions of the kidney. These animals are very sensitive to dietary cholesterol manipulations and a deficiency of cholesterol in their membranes

makes their membranes weak and fragile. When plant sterols found in vegetable oils are substituted for cholesterol in their diets, these animals have a shortened life span.2 Also, these animals are reported to need a proper omega-6 to omega-3 ratio in the kidney phospholipids. It was further reported that feeding oils high in omega-6 fatty acids without omega-3 fatty acids resulted in renal injury, and that feeding oils rich in the omega-3 fatty acids such as fish oil, perilla oil, and flaxseed oil prolonged the survival time of this animal.3

The omega-3 fatty acids are recognized as being important, and the conversion of the flax oil-type omega-3 fatty acid (alpha-linolenic acid) to the fish oil-type omega-3 fatty acids (EPA and DHA) is enhanced when the diet contains saturated fat such as coconut oil. This conversion is hindered when there is extra omega-6 oils in the diet.4 Injury to the kidney from immune dysfunction (IgA nephropathy) responds to omega-3 fats (both flax oil-type omega-3 and fish oil-type omega-3).5 As noted, adding the saturated fats, especially coconut oil, improves the body's use of omega-3 fatty acids.

Another reason that coconut oil enhances kidney function is because it supplies myristic acid, the 14-carbon saturated fatty acid.6 Myristic acid is involved in the signalling from cell membrane receptors through G proteins and their attachment to membranes. These signalling proteins require a lipid such as myristic acid to be added to one end of the protein, a process called myristolation.7

Thus, the fats that we recommend for general good health, namely various saturated animal fats and tropical oils, along with a supplement of flax oil, are also specifically helpful for kidney function. Products containing high omega-6 oils and trans fatty acids should be avoided.

A New Look at Coconut Oil

Written by Mary G. Enig, PhD
Saturday, January 01 2000 14:37
http://www.westonaprice.org/know-your-fats...-at-coconut-oil

Health and Nutritional Benefits from Coconut Oil: An Important Functional Food for the 21st Century

Presented at the AVOC Lauric Oils Symposium, Ho Chi Min City, Vietnam, 25 April 1996
Abstract

Coconut oil has a unique role in the diet as an important physiologically functional food. The health and nutritional benefits that can be derived from consuming coconut oil have been recognized in many parts of the world for centuries. Although the advantage of regular consumption of coconut oil has been underappreciated by the consumer and producer alike for the recent two or three decades, its unique benefits should be compelling for the health minded consumer of today. A review of the diet/heart disease literature relevant to coconut oil clearly indicates that coconut oil is at worst neutral with respect to atherogenicity of fats and oils and, in fact, is likely to be a beneficial oil for prevention and treatment of some heart disease. Additionally, coconut oil provides a source of antimicrobial lipid for individuals with compromised immune systems and is a nonpromoting fat with respect to chemical carcinogenesis.
I. Introduction

Mr. Chairman and members of the ASEAN Vegetable Oils Club, I would like to thank you for inviting me to participate in this Lauric Oils Symposium. I am pleased to have the opportunity to review with you some information that I hope will help redress some of the anti-tropical oils rhetoric that has been so troublesome to your industry.

I will be covering two important areas in my presentation. In the first part, I would like to

review the history of the major health challenge facing coconut oil today. This challenge is based on a supposed negative role played by saturated fat in heart disease. I hope to dispel any acceptance of this notion with the information I will present to you today. I will show you how both animal studies and human studies have exonerated coconut oil of causing the problem.

In the second part of my talk I will suggest some new directions where important positive health benefits are seen for coconut oil. These benefits stem from coconut oil's use as a food with major antimicrobial and anticancer benefits. I will present to you some of the rationale for this effect and some of the supporting literature.

The health and nutritional benefits derived from coconut oil are unique and compelling. Although the baker and food processor have recognized the functional advantages of coconut oil in their industries, over most competing oils, for many years, I believe these benefits are underappreciated today by both the producer and the consumer. It is time to educate and reeducate all t hose who harbor this misinformation.

Historically, coconuts and their extracted oil have served man as important foods for thousands of years. The use of coconut oil as a shortening was advertised in the United States in popular cookbooks at the end of the 19th century. Both the health-promoting attributes of coconut oil and those functional properties useful to the homemaker were recognized 100 years ago. These same attributes, in addition to some newly discovered ones, should be of great interest to both the producing countries as well as the consuming countries.
II. Origins of the Diet/Heart Hypothesis

Although popular literature of epidemiological studies usually attribute an increased risk of coronary heart disease (CHD) to elevated levels of serum cholesterol, which in turn are thought to derive from a dietary intake of saturated fats and cholesterol. But, saturated fats may be considered a major culprit for CHD only if the links between serum cholesterol and CHD, and between saturated fat and serum cholesterol are each firmly established. Decades of large-scale tests and conclusions therefrom have purported to establish the first link. In fact, this relationship has reached the level of dogma. Through the years metabolic ward and animal studies have claimed that dietary saturated fats increase serum cholesterol levels, thereby supposedly establishing the second link. But the scientific basis for these relationships has now been challenged as resulting from large-scale misinterpretation and misrepresentation of the data. (Enig 1991, Mann 1991, Smith 1991, Ravnskov 1995)

Ancel Keys is largely responsible for starting the anti-saturated fat agenda in the United States. From 1953 to 1957 Keys made a series of statements regarding the atherogenicity of fats. These pronouncements were:
"All fats raise serum cholesterol; Nearly half of total fat comes from vegetable fats and oils; No difference between animal and vegetable fats in effect on CHD (1953); Type of

fat makes no difference; Need to reduce margarine and shortening (1956); All fats are comparable; Saturated fats raise and polyunsaturated fats lower serum cholesterol; Hydrogenated vegetable fats are the problem; Animal fats are the problem (1957-1959)."

As can be seen, his findings were inconsistent.
What was the role of the edible oil industry in promoting the diet/heart hypothesis?

It is important to realize that at that time (1960s) the edible oil industry in the United States seized the opportunity to promote its polyunsaturates. The industry did this by developing a health issue focusing on Key's anti-saturated fat bias. With the help of the edible oil industry lobbying in the United States, federal government dietary goals and guidelines were adopted incorporating this mistaken idea that consumption of saturated fat was causing heart disease. This anti-saturated fat issue became the agenda of government and private agencies in the US and to an extent in other parts of the world. This is the agenda that has had such a devastating effect on the coconut industry for the past decade. Throughout the 1960s, the 1970s, the 1980s, and the 1990s, the anti-saturated fat rhetoric increased in intensity.
What are some of the contradictions to the hypothesis blaming saturated fat?

Recently, an editorial by Harvard's Walter Willett, M.D. in the American Journal of Public Health (1990) acknowledged that even though
"the focus of dietary recommendations is usually a reduction of saturated fat intake, no relation between saturated fat intake and risk of CHD was observed in the most informative prospective study to date."

Another editorial, this time by Framingham's William P. Castelli in the Archives of Internal Medicine (1992), declared for the record that
"...in Framingham, Mass, the more saturated fat one ate, the more cholesterol one ate, the more calories one ate, the lower the person's serum cholesterol... the opposite of what the equations provided by Hegsted at al (1965) and Keys et al (1957) would predict..."

Castelli further admitted that
"...In Framingham, for example, we found that the people who ate the most cholesterol, ate the most saturated fat, ate the most calories, weighed the least, and were the most physically active."
III. Coconut Oil and the Diet/Heart Hypothesis

For the past several decades you have heard about animal and human studies feeding coconut oil that purportedly showed increased indices for cardiovascular risk. Blackburn et al (1988) have reviewed the published literature of coconut oil's effect on serum cholesterol and atherogenesis and have concluded that when ...[coconut oil is] fed physiologically with other fats or adequately supplemented with linoleic acid, coconut oil

is a neutral fat in terms of atherogenicity. After reviewing this same literature, Kurup and Rajmohan (1995) conducted a study on 64 volunteers and found ...no statistically significant alteration in the serum total cholesterol, HDL cholesterol, LDL cholesterol, HDL cholesterol/total cholesterol ratio and LDL cholesterol/HDL cholesterol ratio of triglycerides from the baseline values... A beneficial effect of adding the coconut kernel to the diet was noted by these researchers.
How did coconut oil get such a negative reputation?

The question then is, how did coconut oil get such a negative reputation? The answer quite simply is, initially, the significance of those changes that occurred during animal feeding studies were misunderstood. The wrong interpretation was then repeated until ultimately the misinformation and disinformation took on a life of its own.

The problems for coconut oil started four decades ago when researchers fed animals hydrogenated coconut oil that was purposefully altered to make it completely devoid of any essential fatty acids. The hydrogenated coconut oil was selected instead of hydrogenated cottonseed, corn or soybean oil because it was a soft enough fat for blending into diets due to the presence of the lower melting medium chain saturated fatty acids. The same functionality could not be obtained from the cottonseed, corn or soybean oils if they were made totally saturated, since all their fatty acids were long chain and high melting and could not be easily blended nor were they as readily digestible.

The animals fed the hydrogenated coconut oil (as the only fat source) naturally became essential fatty acid deficient; their serum cholesterol levels increased. Diets that cause an essential fatty acid deficiency always produce an increase in serum cholesterol levels as well as an increase in the atherosclerotic indices. The same effect has also been seen when other essential fatty acid deficient, highly hydrogenated oils such as cottonseed, soybean, or corn oils have been fed; so it is clearly a function of the hydrogenated product, either because the oil is essential fatty acid (EFA) deficient or because of trans fatty acids (TFA).
What about the studies where animals were fed with unprocessed coconut oil?

Hostmark et al (1980) compared the effects of diets containing 10% coconut fat and 10% sunflower oil on lipoprotein distribution in male Wistar rats. Coconut oil feeding produced significantly lower levels ($p=<0.05$) of pre-beta lipoproteins (VLDL) and significantly higher ($p=<0.01$) alpha-lipoproteins (HDL) relative to sunflower oil feeding.

Awad (1981) compared the effects of diets containing 14% coconut oil, 14% safflower oil or a 5% "control" (mostly soybean) oil on accumulation of cholesterol in tissues in male Wistar rats. The synthetic diets had 2% added corn oil with a total fat of 16% Total tissue cholesterol accumulation for animals on the safflower diet was six times greater than for animals fed the coconut oil, and twice that of the animals fed the control oil.

A conclusion that can be drawn from some of this animal research is that feeding hydrogenated coconut oil devoid of essential fatty acids (EFA) in a diet otherwise devoid of EFA leads to EFA deficiency and potentiates the formation of atherosclerosis markers. It is of note that animals fed regular coconut oil have less cholesterol deposited in their livers and other parts of their bodies.
What about the studies where coconut oil is part of the normal diet of human beings?

Kaunitz and Dayrit (1992) have reviewed some of the epidemiological and experimental data regarding coconut-eating groups and noted that the available population studies show that dietary coconut oil does not lead to high serum cholesterol nor to high coronary heart disease mortality or morbidity. They noted that in 1989 Mendis et al reported undesirable lipid changes when young adult Sri Lankan males were changed from their normal diets by the substitution of corn oil for their customary coconut oil. Although the total serum cholesterol decreased 18.7% from 179.6 to 146.0 mg/dl and the LDL cholesterol decreased 23.8% from 131.6 to 100.3 mg/dl, the HDL cholesterol decreased 41.4% from 43.4 to 25.4 mg/dl (putting the HDL values below the acceptable lower limit) and the LDL/HDL ratio increased 30% from 3.0 to 3.9. These latter two changes would be considered quite undesirable. As noted above, Kurup and Rajmohan (1995) studied the addition of coconut oil alone to previously mixed fat diets and report no significant difference.

Previously, Prior et al (1981) had shown that islanders with high intake of coconut oil showed no evidence of the high saturated fat intake having a harmful effect in these populations. When these groups migrated to New Zealand however, and lowered their intake of coconut oil, their total cholesterol and LDL cholesterol increased, and their HDL cholesterol decreased.
What about the studies where coconut oil was deliberately fed to human beings?

Some of the studies reported thirty and more years ago should have cleared coconut oil of any implication in the development of coronary heart disease (CHD).

For example, when Frantz and Carey (1961) fed an additional 810 kcal/day fat supplement for a whole month to males with high normal serum cholesterol levels, there was no significant difference from the original levels even though the fat supplement was hydrogenated coconut oil.

Halden and Lieb (1961) also showed similar results in a group of hypercholesterolemics when coconut oil was included in their diets. Original serum cholesterol levels were reported as 170 to 370 mg/dl. Straight coconut oil produced a range from 170 to 270 mg/dl. Coconut oil combined with 5% sunflower oil and 5% olive oil produced a range of 140 to 240 mg/dl.

Earlier, Hashim and colleagues (1959) had shown quite clearly that feeding a fat supplement to hypercholesterolemics, where half of the supplement (21% of energy)

was coconut oil (and the other half was safflower oil), resulted in significant reductions in total serum cholesterol. The reductions averaged -29% and ranged from -6.8 to -41.2%.

And even earlier, Ahrens and colleagues (1957) had shown that adding coconut oil to the diet of hypercholesterolemics lowers serum cholesterol from, e.g., 450 mg/dl to 367 mg/dl. This is hardly a cholesterol-raising effect.

Bierenbaum et al (1967) followed 100 young men with documented myocardial infarction for 5 years on diets with fat restricted to 28% of energy. There was no significant difference between the two different fat mixtures (50/50 corn and safflower oils or 50/50 coconut and peanut oils), which were fed as half of the total fat allowance; both diets reduced serum cholesterol. This study clearly showed that 7% of energy as coconut oil was as beneficial to the 50 men who consumed it as for the 50 men who consumed 7% of energy as other oils such as corn oil or safflower. Both groups fared better than the untreated controls.

More recently, Sundram et al (1994) fed whole foods diets to healthy normo-cholesterolemic males, where approximately 30% of energy was fat. Lauric acid (C12:0) and myristic acid (C14:0) from coconut oil supplied approximately 5% of energy. Relative to the baseline measurements of the subjects prior to the experimental diet, this lauric and myristic acid-rich diet showed an increase in total serum cholesterol from 166.7 to 170.0 mg/dl (+1.9%), a decrease in low density lipoprotein cholesterol (LDL-C) from 105.2 to 104.4 mg/dl (-0.1%), an increase in high density lipoprotein cholesterol (HDL-C) from 42.9 to 45.6 mg/dl (+6.3%). There was a 2.4% decrease in the LDL-C/HDL-C ratio from 2.45 to 2.39. These findings indicate a favorable alteration in serum lipoprotein balance was achieved when coconut oil was included in a whole food diet at 5% of energy.

Tholstrup et al (1994) report similar results with whole foods diets high in lauric and myristic acids from palm kernel oil. The HDL cholesterol levels increased significantly from baseline values (37.5 to 46.0 mg/dl, $P<0.01$) and the LDL-C/HDL-C ratios decreased from 3.08 to 2.69. The increase in total cholesterol was from 154.7 (baseline) to 170.9 mg/dl on the experimental diet.

Ng et al (1991) fed 75% of the fat ration as coconut oil (24% of energy) to 83 adult normocholesterolemics (61 males and 22 females). Relative to baseline values, the highest values on the experimental diet for total cholesterol was increased 17% (169.6 to 198.4 mg/dl), HDL cholesterol was increased 21.4% (44.3 to 53.8 mg/dl), and the LDL-C/HDL-C ratio was decreased 3.6% (2.51 to 2.42).

When unprocessed coconut oil is added to an otherwise normal diet, there is frequently no change in the serum cholesterol although some studies have shown a decrease in total cholesterol. For example, when Ginsberg et al provided an "Average American"

diet with 2-3 times more myristic acid (C14:0), 4.5 times more lauric acid (C12:0), and 1.2 times more palmitic and stearic acid (C16:0 and C18:0) than their "Mono [unsaturated]" diet and the National Cholesterol Education Program "Step 1" diet, there was no increase in serum cholesterol, and in fact, serum cholesterol levels for this diet group fell approximately 3% from 177.1 mg% to 171.8 mg% during the 22 week feeding trial.

It appears from many of the research reports that the effect coconut oil has on serum cholesterol is the opposite in individuals with low serum cholesterol values and those with high serum values. We see that there may be a raising of serum total cholesterol, LDL cholesterol and especially HDL cholesterol in individuals with low serum cholesterol. On the other hand there is lowering of total cholesterol and LDL cholesterol in hypercholesterolemics as noted above.

Studies that supposedly showed a hypercholesterolemic effect of coconut oil feeding, in fact, usually only showed that coconut oil was not as effective at lowering the serum cholesterol as was the more unsaturated fat being compared. This appears to be in part because coconut oil does not drive cholesterol into the tissues as does the more polyunsaturated fats. The chemical analysis of the atheroma shows that the fatty acids from the cholesterol esters are 74% unsaturated (41% is polyunsaturated) and only 24% are saturated. None of the saturated fatty acids were reported to be lauric acid or myristic acid (Felton et al 1994).
Should coconut oil be used to prevent coronary heart disease?

There is another aspect to the coronary heart disease picture. This is related to the initiation of the atheromas that are reported to be blocking arteries. Recent research is suggestive that there is a causative role for the herpes virus and cytomegalovirus in the initial formation of atherosclerotic plaques and the recloging of arteries after angioplasty. (New York Times 1991) What is so interesting is that the herpes virus and cytomegalovirus are both inhibited by the antimicrobial lipid monolaurin; but monolaurin is not formed in the body unless there is a source of lauric acid in the diet. Thus, ironically enough, one could consider the recommendations to avoid coconut and other lauric oils as contributing to the increased incidence of coronary heart disease.

Perhaps more important than any effect of coconut oil on serum cholesterol is the additional effect of coconut oil on the disease fighting capability of the animal or person consuming the coconut oil.
IV. Coconut Oil and Cancer

Lim-Sylianco (1987) has reviewed 50 years of literature showing anticarcinogenic effects from dietary coconut oil. These animal studies show quite clearly the nonpromotional effect of feeding coconut oil.

In a study by Reddy et al (1984) straight coconut oil was more inhibitory than MCT oil to

induction of colon tumors by azoxymethane. Chemically induced adenocarcinomas differed 10-fold between corn oil (32%) and coconut oil (3%) in the colon. Both olive oil and coconut oil developed the low levels (3%) of the adenocarcinomas in the colon, but in the small intestine animals fed coconut oil did not develop any tumors while 7% of animals fed olive oil did.

Studies by Cohen et al (1986) showed that the nonpromotional effects of coconut oil were also seen in chemically induced breast cancer. In this model, the slight elevation of serum cholesterol in the animals fed coconut oil was protective as the animals fed the more polyunsaturated oil had reduced serum cholesterol and more tumors. The authors noted that "...an overall inverse trend was observed between total serum lipids and tumor incidence for the 4 [high fat] groups."

This is an area that needs to be pursued.
V. Coconut Oil Antimicrobial Benefits

I would now like to review for you some of the rationale for the use of coconut oil as a food that will serve as the raw material to provide potentially useful levels of antimicrobial activity in the individual.

The lauric acid in coconut oil is used by the body to make the same disease-fighting fatty acid derivative monolaurin that babies make from the lauric acid they get from their mothers= milk. The monoglyceride monolaurin is the substance that keeps infants from getting viral or bacterial or protozoal infections. Until just recently, this important benefit has been largely overlooked by the medical and nutrition community.

Recognition of the antimicrobial activity of the monoglyceride of lauric acid (monolaurin) has been reported since 1966. The seminal work can be credited to Jon Kabara. This early research was directed at the virucidal effects because of possible problems related to food preservation. Some of the early work by Hierholzer and Kabara (1982) that showed virucidal effects of monolaurin on enveloped RNA and DNA viruses was done in conjunction with the Center for Disease Control of the US Public Health Service with selected prototypes or recognized representative strains of enveloped human viruses. The envelope of these viruses is a lipid membrane.

Kabara (1978) and others have reported that certain fatty acids (e.g., medium-chain saturates) and their derivatives (e.g., monoglycerides) can have adverse effects on various microorganisms: those microorganisms that are inactivated include bacteria, yeast, fungi, and enveloped viruses.

The medium-chain saturated fatty acids and their derivatives act by disrupting the lipid membranes of the organisms (Isaacs and Thormar 1991) (Isaacs et al 1992). In particular, enveloped viruses are inactivated in both human and bovine milk by added fatty acids (FAs) and monoglycerides (MGs) (Isaacs et al 1991) as well as by

endogenous FAs and MGs (Isaacs et al 1986, 1990, 1991, 1992; Thormar et al 1987).

All three monoesters of lauric acid are shown to be active antimicrobials, i.e., alpha-, alpha'-, and beta-MG. Additionally, it is reported that the antimicrobial effects of the FAs and MGs are additive and total concentration is critical for inactivating viruses (Isaacs and Thormar 1990).

The properties that determine the anti-infective action of lipids are related to their structure; e.g., monoglycerides, free fatty acids. The monoglycerides are active, diglycerides and triglycerides are inactive. Of the saturated fatty acids, lauric acid has greater antiviral activity than either caprylic acid (C-10) or myristic acid (C-14).

The action attributed to monolaurin is that of solubilizing the lipids and phospholipids in the envelope of the virus causing the disintegration of the virus envelope. In effect, it is reported that the fatty acids and monoglycerides produce their killing/inactivating effect by lysing the (lipid bilayer) plasma membrane. However, there is evidence from recent studies that one antimicrobial effect is related to its interference with signal transduction (Projan et al 1994).

Some of the viruses inactivated by these lipids, in addition to HIV, are the measles virus, herpes simplex virus-1 (HSV-1), vesicular stomatitis virus (VSV), visna virus, and cytomegalovirus (CMV). Many of the pathogenic organisms reported to be inactivated by these antimicrobial lipids are those known to be responsible for opportunistic infections in HIV-positive individuals. For example, concurrent infection with cytomegalovirus is recognized as a serious complication for HIV+ individuals (Macallan et al 1993). Thus, it would appear to be important to investigate the practical aspects and the potential benefit of an adjunct nutritional support regimen for HIV-infected individuals, which will utilize those dietary fats that are sources of known anti-viral, anti-microbial, and anti-protozoal monoglycerides and fatty acids such as monolaurin and its precursor lauric acid.

No one in the mainstream nutrition community seems to have recognized the added potential of antimicrobial lipids in the treatment of HIV-infected or AIDS patients. These antimicrobial fatty acids and their derivatives are essentially non-toxic to man; they are produced in vivo by humans when they ingest those commonly available foods that contain adequate levels of medium-chain fatty acids such as lauric acid. According to the published research, lauric acid is one of the best "inactivating" fatty acids, and its monoglyceride is even more effective than the fatty acid alone (Kabara 1978, Sands et al 1978, Fletcher et al 1985, Kabara 1985).

The lipid coated (envelop) viruses are dependent on host lipids for their lipid constituents. The variability of fatty acids in the foods of individuals accounts for the variability of fatty acids in the virus envelop and also explains the variability of glycoprotein expression.

Loss of lauric acid from the American diet

Increasingly, over the past 40 years, the American diet has undergone major changes. Many of these changes involve changes of fats and oils. There has been an increasing supply of the partially hydrogenated trans-containing vegetable oils and a decreasing amount of the lauric acid-containing oils. As a result, there has been an increased consumption of trans fatty acids and linoleic acid and a decrease in the consumption of lauric acid. This type of change in diet has an effect on the fatty acids the body has available for metabolic activities.

VI. Lauric Acid in Foods

The coconut producing countries

Whole coconut as well as extracted coconut oil has been a mainstay in the food supply in many countries in parts of Asia and the Pacific Rim throughout the centuries. Recently though, there has been some replacement of coconut oil by other seed oils. This is unfortunate since the benefits gained from consuming an adequate amount of coconut oil are being lost.

Based on the per capita intake of coconut oil in 1985 as reported by Kaunitz (1992), the per capita daily intake of lauric acid can be approximated. For those major producing countries such as the Philippines, Indonesia, and Sri Lanka, and consuming countries such as Singapore, the daily intakes of lauric acid were approximately 7.3 grams (Philippines), 4.9 grams (Sri Lanka), 4.7 grams (Indonesia), and 2.8 grams (Singapore). In India, intake of lauric acid from coconut oil in the coconut growing areas (e.g., Kerala) range from about 12 to 20 grams per day (Eraly 1995), whereas the average for the rest of the country is less than half a gram. An average high of approximately 68 grams of lauric acid is calculated from the coconut oil intake previously reported by Prior et al (1981) for the Tokelau Islands. Other coconut producing countries may also have intakes of lauric acid in the same range.

The US experience

In the United States today, there is very little lauric acid in most of the foods. During the early part of the 20th Century and up until the late 1950s many people consumed heavy cream and high fat milk. These foods could have provided approximately 3 grams of lauric acid per day to many individuals. In addition, desiccated coconut was a popular food in homemade cakes, pies and cookies, as well as in commercial baked goods, and 1-2 tablespoons of desiccated coconut would have supplied 1-2 grams of lauric acid. Those foods made with the coconut oil based shortenings would have provided additional amounts.

Until two years ago, some of the commercially sold popcorn, at least in movie theaters, had coconut oil as the oil. This means that for those people lucky enough to consume this type of popcorn the possible lauric acid intake was 6 grams or more in a three (3) cup order.

Some infant formulas (but not all) have been good sources of lauric acid for infants. However, in the past 3-4 years there has been reformulation with a loss of a portion of coconut oil in these formulas, and a subsequent lowering of the lauric acid levels.

Only one US manufactured enteral formula contains lauric acid (e.g., Impact7); this is normally used in hospitals for tube feeding; it is reported to be very effective in reversing severe weight loss in AIDS patients, but it is discontinued when the patients leave the hospital because it is not sufficiently palatable for oral use. The more widely promoted enteral formulas (e.g., Ensure7, Nutren7) are not made with lauric oils, and, in fact, many are made with partially hydrogenated oils.

There are currently some candies sold in the US that are made with palm kernel oil, and a few specialty candies made with coconut oil and desiccated coconut. These can supply small amounts of lauric acid.

Cookies such as macaroons, if made with desiccated coconut, are good sources of lauric acid, supplying as much as 6 grams of lauric acid per macaroon (Red Mill). However, these cookies make up a small portion of the cookie market. Most cookies in the United States are no longer made with coconut oil shortenings; however, there was a time when many US cookies (e.g., Pepperidge Farm) were about 25% lauric acid.

Originally, one of the largest manufacturers of cream soups used coconut oil in the formulations. Many popular cracker manufacturers also used coconut oil as a spray coating. These products supplied a small amount of lauric acid on a daily basis for some people.
How much lauric acid is needed?

It is not known exactly how much food made with lauric oils is needed in order to have a protective level of lauric acid in the diet. Infants probably consume between 0.3 and 1 gram per kilogram of body weight if they are fed human milk or an enriched infant formula that contains coconut oil. This amount appears to have always been protective. Adults could probably benefit from the consumption of 10 to 20 grams of lauric acid per day. Growing children probably need about the same amounts as adults.
VII. Recommendations

The coconut oil industry needs to make the case for lauric acid now. It should not wait for the rapeseed industry to promote the argument for including lauric acid because of the increased demand for laurate. In fact lauric acid may prove to be a conditionally essential saturated fatty acid, and the research to establish this fact around the world needs to be vigorously promoted.

Although private sectors need to fight for their commodity through the offices of their trade associations, the various governments of coconut producing countries need to put

pressure on WHO, FAO, and UNDP to recognizes the health importance of coconut oil and the other coconut products. Moreover, those representatives who are going to do the persuading need to believe that their message is scientifically correct -- because it is.

Among the critical foods and nutrition "buzz words" for the 21st Century is the term "functional foods." Clearly coconut oil fits the designation of a very important functional food.

http://www.westonaprice.org/know-your-fats...e-a-phony-issue

"The Soft Science of Dietary Fats," by Gary Taubes, in the March 30, 2001 issue of Science,1 exposes the shenanigans of the 1970s McGovern Senate Committee staff and the follow-on by various government agencies that gave us the anti-fat, anti-cholesterol dietary goals and guidelines. This exposé adds to the material in "The Oiling of America"2 by Enig and Fallon and The Cholesterol Myths3 by Ravnskov. Taken together, these works provide substantial food for thought.

Blood cholesterol levels between 200 and 240 mg/dl are normal. These levels have always been normal. In older women, serum cholesterol levels greatly above these numbers are also quite normal, and in fact they have been shown to be associated with longevity. Since 1984, however, in the United States and other parts of the western world, these normal numbers have been treated as if they were an indication of a disease in progress or a potential for disease in the future.

As a result of some of this misinformation, which was purposefully planted by the leadership of the National Heart, Lung and Blood Institute (NHLBI) in 1984, many hundreds of thousands of people are treated with expensive medications to prevent the development of a non-existent illness. If the medications were only expensive and not life threatening, their use could no doubt be shrugged off as a harmless snake oil pharmaceutical scam; but, in fact, these are thoroughly dangerous medications for both physical and emotional reasons—for physical reasons because their use can lead to serious untreatable diseases such as liver cancer, and for emotional reasons because their use perpetuates the myth that cholesterol is dangerous and evil.

In his book The Cholesterol Myths, Dr. Uffe Ravnskov tells us what happens to an older woman who has normal high serum cholesterol levels. When her blood is tested in a forced cholesterol checkup, the cholesterol myth is used to justify treatment of her nonexistent disease state and she loses her vibrant state of good health.

The official advice to lower serum cholesterol levels has brought about numerous supplements with the attached claim that consuming them will lower cholesterol. This further supports the myth of cholesterol as an undesirable component of body and diet. In fact, the body uses cholesterol to repair and to protect. When improvement to the health of the body brought about by good changes in lifestyle or diet results in a lowering of serum cholesterol, it can be counted as an example of the body no longer needing the extra circulating cholesterol. The repair has been accomplished.

A month after the exposé in Science, the NHLBI responded by lowering its recommended "at risk" cholesterol level and increasing the number of people it wants to put on cholesterol lowering drugs. But there may be hope that the truth will win. Independent thoughtful researchers have continued to point out that there is a real need for correcting the wrong advice given to the public regarding the consumption of dietary fats. New research continues to show that the saturated fats are not a problem, that the trans fatty acids found in partially hydrogenated vegetable fats and oils really are a problem, and that the lack of appropriate balance in the diet of the polyunsaturated omega-3 and omega-6 fatty acids is also a problem. Even the mono-unsaturates have been taken to task by some of the recent research. And lowfat diets are being shown to be counterproductive.

The lesson to be learned from all of this is that the old-fashioned, more saturated fats form the healthy basis of a good quality diet. And a good quality diet can help to produce a state of vibrant good health. Meanwhile, there is no need to worry about your cholesterol levels. This is a phony issue.

Cholesterol and Stroke

Written by Chris Masterjohn

http://www.westonaprice.org/know-your-fats...erol-and-stroke

ARTICLE SUMMARY
Stroke is the leading cause of disability and the third leading cause of death in the United States and most developed countries. There are two types of stroke: ischemic and hemorrhagic. The more common ischemic stroke results from blockage of a blood vessel supplying the brain, whereas the more damaging hemorrhagic stroke results from rupture of such a vessel.
As cholesterol levels increase, the risk of hemorrhagic stroke decreases and the risk of ischemic stroke increases.
Stroke mortality is lowest at cholesterol levels between 180 and 200. Mortality increases substantially below 180 and above 240. Mortality is highest below 160 and above 300.
Although cholesterol itself does not cause stroke, a diet high in polyunsaturated fat and low in antioxidants can make LDL-cholesterol within the blood vulnerable to oxidation. Oxidized LDL can contribute to the development of stroke.
High blood pressure is a far more important contributor to stroke than high or low cholesterol.
Animal fat and fatty fish are associated with a lower risk of stroke. Polyunsaturated fat and carbohydrates are associated with a higher risk of stroke.
Exercise, stress management, proper control of oral or systemic infections, and adequate nutrition can lower the risk of stroke. Important protective nutrients include magnesium, potassium, antioxidants and adequate protein.

Cholesterol is essential to human life. It is a primary constituent of cell membranes, essential to learning and memory, and the fundamental building block of bile acids,

vitamin D, and the steroid hormones.1 Because in most cases the body synthesizes all the cholesterol it needs, however, scientists do not consider it an essential nutrient. Weston Price did not study the cholesterol content of primitive and modern diets, and he wrote his epic work, Nutrition and Physical Degeneration, decades before the medical establishment began measuring blood cholesterol levels and recommending cholesterol- lowering drugs and diets.2

Although Price's work did not directly concern this vital molecule, the medical establishment's campaign against it has nevertheless produced a nutritional paradigm that is antithetical to his findings: the American Heart Association, for example, recommends lowering cholesterol by limiting the consumption of butter, egg yolks, and organ meats – foods that formed the centerpiece of the primitive diets that Price's work esteemed.3

Stroke Then and Now

Stroke is the third leading cause of death in the United States.4 Through the early 1990s, neither epidemiological studies5 nor controlled trials of cholesterol-lowering drugs6 were able to generate any evidence for an association between cholesterol levels and the risk of this disease. Today, however, the scene is very different. Recent news articles have reported that cholesterol-lowering drugs do, in fact, lower the risk of stroke,7 and that women with high cholesterol levels are at risk even if they are otherwise healthy.8 The American Heart Association now lists reducing the risk of stroke as the second most important reason for avoiding cholesterol-rich foods.3

Those who wish to believe in the association may be tempted to dismiss the old research as inferior by virtue of its comparative antiquity; those who wish to deny the association may be tempted to dismiss the new research as the product of an increasingly entrenched command of research dollars wielded by the manufacturers of cholesterol-lowering drugs. The truth lies somewhere between these two extremes. Research over the last two decades has overcome many of the methodological flaws of earlier research and allowed us to recognize that cholesterol levels are indeed related to stroke—increasing the risk of some forms and decreasing the risk of others. Most important, this research has shown that oxidative stress, inflammation, and the health of the cells that line the blood vessel walls are the true causes underlying the efficacy of cholesterol-lowering statins. Careful examination of these findings allows us to assemble a strategy for preventing stroke within the context of a diet rich in traditional whole foods—including those rich in cholesterol.

Different Strokes

Although a given stroke may have more than one hundred potential causes, the vast majority of strokes fall roughly into two categories: hemorrhagic and ischemic. Hemorrhagic stroke occurs when a blood vessel ruptures, causing uncontrolled bleeding into brain tissue. Ischemic stroke occurs when a blockage closes off the flow of blood within a vessel, depriving brain tissue of the oxygen and nutrients it needs to

survive. (In the US, over 90 percent of all strokes are ischemic.) The cell death that results from this deprivation is called an infarction. Severe buildup of atherosclerotic plaque can occasionally narrow a blood vessel sufficiently to produce an ischemic stroke, but it is usually a clot formed at the site of a ruptured plaque that causes such a stroke. Both forms of the disease cause lasting damage to the delicate tissue of the brain. Stroke is therefore not only the third leading cause of death but also the greatest single cause of disability in most developed countries.9

Finding the Correlation

In 1995, researchers pooled together the results of 45 prospective studies investigating the potential link between cholesterol levels and the risk of stroke. Together, these studies examined this relationship in 450,000 people. The risk of stroke declined slightly with increasing cholesterol levels—an effect so small that it could easily have been due to chance.5

Most studies that began in the 1960s and 1970s, before the advent of computed axial tomography (the CAT scan), failed to distinguish between ischemic and hemmhoragic strokes. Many of them were also primarily designed to study heart disease. Since strokes occur at a later age than heart attacks, the average age of the subjects in these studies was too young and the incidence of stroke too low to detect modest associations with risk factors. These two problems obscured the true relationship of cholesterol to stroke.10

The Honolulu Heart Study enrolled over 8,000 Japanese American men between 1965 and 1968, measured their cholesterol levels and recorded which of them died of stroke over the following six years. The men were between the ages of 45 and 68 at the time of enrollment. Although CAT scans were not yet available, the researchers distinguished between ischemic and hemorrhagic strokes using signs and symptoms, findings at surgery or autopsy. As published in a 1980 issue of the journal Stroke, they found no association between serum cholesterol and ischemic stroke and an inverse association between serum cholesterol and hemorrhagic stroke, meaning a higher cholesterol level was associated with a lower risk of hemorrhagic stroke.11

A second report from the Honolulu Heart Study, published in 1994 with a fifteen year follow-up, however, demonstrated a direct association between serum cholesterol and ischemic stroke. The association was only found among subjects with cholesterol levels higher than 213 milligrams per deciliter (mg/dL) and was very small—over the course of ten years, subjects with cholesterol levels under 213 had a 2.5 percent chance of stroke and those with levels over 240 had a 3.2 chance of stroke.12

This report also showed that the incidence of stroke increases with age to a much greater degree than does the incidence of heart disease. In men younger than sixty, the ratio of heart disease to stroke was greater than three; in men older than sixty, it was less than two.12 This pattern made the very meager association of ischemic stroke with

serum cholesterol impossible to detect after only six years of follow-up.
The Multiple Risk Factor Intervention Trial (MR FIT) confirmed the findings of the Honolulu Heart Study in over 350,000 men. Those with cholesterol levels below 160 had three times the risk of hemorrhagic stroke as those with higher levels, while those with levels over 200 had a higher risk of ischemic stroke compared to those with lower levels. Between 200 and 240, the risk increased by only 20 percent. Those with levels above 280, however, had 2.5 times the risk of ischemic stroke as those with the lowest levels.13

The Eastern Stroke and Coronary Heart Disease Collaborative Research Group confirmed these findings in eastern Asian countries as well. The group pooled the results of 18 prospective studies conducted in China and Japan involving nearly 125,000 people. For every 23 point drop in serum cholesterol, the risk of ischemic stroke decreased by 23 percent and the risk of hemorrhagic stroke increased by 27 percent.14
It was then clear that the inability to discover a relationship of cholesterol levels to “stroke” resulted from the two opposing relationships of cholesterol levels to the two different types of stroke. The relationship between diet and stroke was less clear. Conventional wisdom would have had us believe that if high cholesterol levels increased the risk of ischemic stroke, so would a diet rich in total fat, saturated fat, and cholesterol. Conventional wisdom turned out to be very, very wrong.
A Greasy Situation

The authors of the 1980 Honolulu Heart Study report noted that stroke mortality and incidence among Japanese Americans was far lower than that among residents of Japan. They suggested that the difference owed to the substantially higher intakes of fat and protein among Japanese Americans.11 These authors published another report from the same study in 1985, which found an inverse association between ischemic stroke and the dietary intake of total and saturated fat.15

Other authors examined 198 autopsies of fatal stroke within the same study. They dissected small and large blood vessels of the brain and assessed the severity of atherosclerosis within them. Among 104 men who also had heart disease, there was no association between atherosclerosis and any dietary factors. Among the other 94, intake of fish was inversely associated with atherosclerosis of the small arteries and intake of animal protein and total fat was inversely associated with atherosclerosis of the large arteries. Intake of carbohydrates, by contrast, was positively associated with atherosclerosis of the large arteries.16

A decade later, the Framingham Heart Study found similar results among 800 men whom the researchers followed over the course of 19 years. Although there was no association of stroke with polyunsaturated fat consumption, each additional three percent of calories from total fat was associated with a fifteen percent decrease in the risk of ischemic stroke; each additional one percent of calories from monounsaturated

fat was associated with an eleven percent decrease in risk; and each additional one percent of calories from saturated fat was associated with a nine percent decrease in risk.17

In the last decade, some studies have shown no relationship between the intake of animal fat and the risk of ischemic stroke, but most have continued to show that the risk of this disease is inversely associated with the intake of animal fat and fish.18

How Low Can it Go?

Early trials with cholesterol-lowering drugs were less than promising. A 1993 report pooled together the results of 13 trials conducted between 1966 and 1992 involving over 45,000 men. Cholesterol lowering had no effect on the incidence of stroke. There was a general tendency for it to decrease the risk of nonfatal stroke and increase the risk of fatal stroke, but the only trials in which the magnitudes of these differences were strong enough to be distinguished from the effects of chance were those that used the drug clofibrate. Clofibrate belongs to a class of drugs, called fibrates, that increase the excretion of lipids into the bile. Treatment with clofibrate more than doubled the risk of fatal stroke. The only trial that specifically reported the effect of treatment on hemorrhagic stroke used another fibrate called gemfibrozil. Treatment with this drug resulted in five times the risk of fatal hemorrhagic stroke.25

Hemorrhagic stroke is four times as deadly as ischemic stroke,21 and survival of both types is positively associated with cholesterol levels.22 The results of the early trials with cholesterol-lowering drugs may well reflect a tradeoff between hemorrhagic and ischemic stroke as well as a decreased ability to survive either type.

The results of later trials with statin drugs proved very different. A 2004 report that pooled together the results of 120 lipidlowering trials, including 24 using statins, showed that treatment with statins lowered the risk of stroke by 18 percent. Among ten trials that distinguished hemorrhagic from ischemic stroke, treatment with lipid-lowering therapy in general increased the risk of hemorrhagic stroke by 21 percent, whereas statins themselves increased this risk by only 3 percent; neither effect was large enough to be distinguished from the effect of chance.26 Statins are apparently more successful than older cholesterol-lowering drugs because they more effectively reduce the risk of ischemic stroke and less severely aggravate the risk of hemorrhagic stroke.

Some authors have suggested that statins effectively reduce the risk of stroke because they are more than twice as effective at reducing cholesterol levels compared to older drugs. Indeed, the older drugs only reduced cholesterol levels by an average of eight percent. Statins, by contrast, have reduced them by an average of 22 percent.27 Moreover, the reduction of LDL in these trials corresponds to both the reduction in the risk of stroke and the reduction in the degree of atherosclerosis within the arteries of the neck that supply the brain.28

If the key to the success of statins were limited simply to cholesterol reduction, however, we would expect them to not only lower the risk of ischemic stroke to a greater degree than other drugs, but also to raise the risk of hemorrhagic stroke to a greater degree than other drugs. Instead, we find that statins have no effect on the risk of hemorrhagic stroke at all. Clearly, these drugs are affecting the risk of stroke by some means other than lowering cholesterol.

Correlation versus Causation

It is a fundamental principle of science that correlation does not prove causation. The risk of ischemic stroke is higher among people with high cholesterol levels, but this does not in and of itself show that high cholesterol levels cause ischemic stroke. If a drug that lowers cholesterol also lowers the risk of this disease and the reduction in risk is proportionate to the reduction in cholesterol, this provides evidence that high cholesterol causes the disease—as long as the drug only lowers cholesterol. With statins, however, this is not the case.

Statins do not directly inhibit the synthesis of cholesterol. Instead, they inhibit the synthesis of mevalonate (see Figure 1). Cells use mevalonate to synthesize a number of different chemicals, only one of which is cholesterol. The degree of cholesterol reduction is dependent on the degree of mevalonate reduction; it therefore can also act as a marker for the degree of reduction of other products made from mevalonate. Before concluding which of these products underlies the efficacy of statins, we must look beyond statistical correlations and examine more deeply the molecular mechanisms of the disease process.

Cholesterol

Rho Activation

Many steps in the cholesterol synthesis pathway are omitted in the figure for the sake of simplicity. The key regulated enzymes within this pathway are HMG CoA reductase and squalene synthase. The former converts HMG CoA to mevalonate; the latter converts farnesyl pyrophosphate to squalene. The synthesis of squalene is the first step in this pathway that is committed to the synthesis of cholesterol. Statins suppress both the synthesis of cholesterol and the activation of Rho by inhibiting HMG CoA reductase. Inflammation increases cholesterol levels by stimulating HMG CoA reductase; because it also inhibits squalene synthase, however, most of the mevalonate it produces is diverted into other pathways, such as Rho activation. Because they inhibit HMG CoA

reductase, it is possible that magnesium and dietary cholesterol also suppress Rho activation.

Nitric Oxide

One of the many products of mevalonate activates the enzyme Rho. Rho is a stress signal which, in response to inflammation, changes the shape and tension of the protein fibers that form the cell's skeleton.29 Rho also decreases the production of endothelial nitric oxide synthase (eNOS), the enzyme that synthesizes nitric oxide.30 Nitric oxide itself is a gas that dilates blood vessels, relaxing the smooth muscle cells within their walls and increasing the flow of blood. It also decreases the adhesion of white blood cells to the lining of these vessels, the migration of smooth muscle cells to the sites of atherosclerotic lesions and the formation of blood clots, all of which are involved in the disease process that leads to ischemic stroke.31

By inhibiting the activation of Rho,30 statins greatly increase the levels of eNOS and the amount and activity of nitric oxide within the blood vessel lining.32,33 When researchers experimentally induce a stroke in mice with normal cholesterol levels, prior administration of statins greatly increases the flow of blood within the brain and reduces the damage to brain tissue and the neurological deficits that follow. The benefit occurs even when the dose and length of administration is insufficient to reduce cholesterol; in mice that are genetically engineered to lack the eNOS enzyme, by contrast, statins have no effect.34 These drugs clearly protect against stroke in ways that are dependent on eNOS and have nothing to do with cholesterol.

There is also evidence that the inhibition of Rho offers additional protection against stroke in some animal models by increasing the body's ability to dissolve blood clots independently of both eNOS and cholesterol.35

Because both Rho activation and cholesterol synthesis depend on the availability of mevalonate, the ability of a given drug or a given dose of that drug to inhibit one substance is going to correlate with its ability to inhibit the other. These things make it clear that a protective effect of statins—even one that correlates with cholesterol reduction—is not necessarily evidence that cholesterol itself causes stroke.

Is Cholesterol Irrelevant?

It would be a mistake to conclude from these observations that cholesterol is entirely irrelevant to the process that leads to ischemic stroke. Most likely, the level of low-density lipoprotein (LDL) cholesterol is a loose indicator of the level of oxidized LDL, a particle that can, indeed, contribute to the disease process that underlies this form of stroke.

An LDL particle carries cholesterol and triglycerides through the blood within a membrane made of lipid and protein. The membrane consists primarily of many phospholipids interwoven with one large protein molecule; although most of the

cholesterol is contained within the core of the particle, a small amount is also distributed throughout the membrane. The amino acids within the protein and the unsaturated fatty acids within the phospholipids are vulnerable to oxidation; they are also protected by certain vitamins, polyphenols and other antioxidants that are carried within the lipoprotein. When we refer to the oxidation of LDL, we refer primarily to the oxidation of the phospholipids and protein at the surface of the particle rather than the cholesterol within its core.

Oxidation of LDL causes it to accumulate in certain scavenger white blood cells called macrophages—an instrumental event in its accumulation within atherosclerotic plaque.41 Oxidized LDL also suppresses the production of eNOS. Since nitric oxide inhibits the oxidation of LDL, the loss of nitric oxide and the oxidation of LDL could produce a vicious cycle.33 When the level of sugar in the blood rises, it can similarly damage LDL in a process called glycation. Although less powerfully than oxidized LDL, glycated LDL also accumulates in macrophages42 and suppresses the production of eNOS.43

Selectively filtering LDL from the blood of patients with high cholesterol—most of which is oxidized—appears to improve nitric oxide production and blood flow.44 Researchers have unfortunately only tested the effect of this treatment on these parameters in small, uncontrolled trials.

We cannot with any confidence quantify the contribution of oxidized LDL to the development of stroke, but the evidence strongly suggests that it plays some part. The very meager association between cholesterol levels and ischemic stroke probably reflects both the indirect association of cholesterol with chronic inflammation (see sidebar) and the causal contribution of oxidized LDL.

Low Cholesterol and Hemorrhagic Stroke

Whether and how low cholesterol causes the increased risk of hemorrhagic stroke with which it is associated is an open question. Animal experiments have shown that diets high in animal fat and cholesterol reduce the incidence of stroke in rats with high blood pressure.17 In humans, the inverse association between cholesterol levels and hemorrhagic stroke primarily exists among those with diastolic blood pressure above 90 millimeters mercury (mm Hg).13 Cholesterol probably protects against hemorrhage by strengthening and stabilizing the blood vessel walls, especially when these walls need extra strength to withstand the constant onslaught of high blood pressure.

Practical Prevention

Despite the opposing relationships of cholesterol levels to ischemic and hemorrhagic strokes, the distribution of risk is not even across cholesterol levels. In the large MR FIT trial, for example, stroke mortality was lowest between 180 and 200. Mortality substantially increased below 180 and above 240; it was highest below 160 and above 300.13 While it is unlikely that total or LDL cholesterol themselves play a major role in

the development of stroke, oxidation or glycation of that LDL will contribute to the atherosclerotic process and the breakdown of nitric oxide functioning. It therefore may be a sensible precaution to use exercise and, where needed, nutritional supplements to maintain moderate levels of cholesterol and to eat a diet rich in antioxidants to protect that cholesterol from damage.

Magnesium is essential to the regulation of cholesterol synthesis. Like statin drugs, magnesium inhibits the enzyme that produces mevalonate, a precursor to cholesterol. Unlike statins, however, cellular enzymes also use magnesium to increase the production of mevalonate when needed. Supplements with this mineral can lower levels of LDL and raise levels of HDL; since they provide the body with the resources it needs to regulate these levels rather than interfere with the body's physiological processes, they are unlikely to exhibit any of the adverse effects exhibited by statins.39

Diets low in fat or animal products should not be used to lower cholesterol for the prevention of ischemic stroke. The available data clearly indicate that these foods are associated with a decreased risk, not an increased risk, of this type of stroke.17 Since carbohydrate intake is associated with atherosclerosis of the large arteries within the brain,16 eating lower amounts of carbohydrates would be a wiser dietary modification.

Additionally, increasing polyunsaturated fat intake in the DART trial doubled stroke mortality.23 Polyunsaturated fatty acids are vulnerable to oxidation within the body49 and their incorporation into lipoproteins would make those lipoproteins more likely to oxidize. Since there is evidence that fatty fish is protective against stroke,18 however, we should give priority to reducing omega-6 fatty acids from vegetable oils rather than the elongated omega-3 fatty acids from fish. Even among traditional fats, an overemphasis on olive oil, flax oil, chicken fat, or even very large amounts of lard could lead us to consume an excess of polyunsaturated fat. These nourishing foods have their place, but more saturated fats like butter, tallow and coconut oil should form the mainstay of a diet rich in fat.

Exercise, antioxidant-rich foods and proper treatment of chronic oral or systemic infections will help maintain the rich supply of nitric oxide that blood vessels need. Since the amino acid L-arginine is the raw material for nitric oxide production, adequate protein is also important.

Blood pressure is far more critical to the development of stroke than is cholesterol. Exercise, stress management and adequate intake of potassium can be useful in controlling blood pressure. Some individuals may also need to moderate their intake of salt.

Were it true, as many contend, that the consumption of cholesterol-rich animal foods such as butter, egg yolks and organ meats puts one at risk for stroke, we would be forced to make the difficult choice between the diet that builds robust and sturdy bodies

and the diet that allows us to live safely into old age. Thankfully, there is no evidence that these foods will do anything but protect us from stroke. Nutrient-dense animal foods are gifts for which we should all be grateful. They supply the body with the resources it needs both to build itself up during youth and to maintain its integrity into old age.

Sidebars
A Question of Bias

A case control study of 180 subjects published in 1996 showed that LDL-cholesterol had a strong, positive association with ischemic stroke and that HDL-cholesterol had a strong, negative association with ischemic stroke. The authors were surprised to find, however, that saturated fat intake was over 25 percent lower in stroke patients than in controls.19

Case control studies are conducted retrospectively—that is, after the endpoints or results one is trying to learn about have already occurred. For this reason, they are subject to a number of biases to which prospective studies are not. The authors of this report suggested that the inverse association of stroke with the intake of saturated fat resulted from one of these biases: patients who have a history of high cholesterol and triglycerides would be counseled to avoid saturated fat. Therefore, they argued, the low intake of saturated fat would not have caused the disease; rather, the disease would have caused the low intake of saturated fat.

To support this proposition, they examined the medical records of a subset of their subjects to see whether a prior diagnosis of high lipid levels was associated with a low intake of saturated fat during the time of the study. Indeed, this was the case. They produced no evidence, however, that the diet followed rather than preceded the diagnosis. If it is true that the patients only followed a low-fat diet after being diagnosed with high lipid levels, it leaves open the question of why the diet did not lower their lipid levels or their risk of stroke. The suggestion that the low intake of saturated fat was caused by the disease rather than the disease by the low intake of saturated fat may have been easier to reconcile with the researchers' presuppositions, but it is more difficult to reconcile with the consistent evidence from prospective studies that total fat and animal fat consumption is inversely associated with the incidence of stroke.
Take Your Pick

In his book Eat to Live, Dr. Joel Fuhrman argues that avoiding animal foods is an important strategy for stroke prevention. Although low cholesterol levels increase the risk of hemorrhagic stroke, this type only represents eight percent of the total; since the vast majority of strokes are of ischemic origin, he maintains, eating a cholesterol-lowering diet will lower the risk of stroke.20

This point of view suffers from three fundamental flaws: first, the data indicates that the

rate of hemorrhagic stroke is low in western countries because our cholesterol levels tend to be high; second, hemorrhagic strokes are far more dangerous than ischemic strokes; and third, as already shown, animal foods are associated with a decrease—not an increase—in the risk of ischemic stroke.

Among Japanese American men living in Hawaii, whose intakes of animal fat and protein are lower than those of mainland Americans but higher than those of men living in Japan, hemorrhagic stroke constitutes 25 percent of all strokes.11 In China and Japan, where serum cholesterol levels correspond to the bottom two thirds of the range of western levels, hemorrhagic stroke constitutes 42 percent of all strokes. The authors of a collaborative research project pooling the results of 18 studies conducted in this region found that as cholesterol levels increased, hemorrhagic stroke constituted a lower proportion of total strokes; as cholesterol levels decreased, hemorrhagic stroke constituted a higher proportion of total strokes.14 Although the risk of hemorrhagic stroke may be low in the United States, the rates of this more dangerous type of stroke would almost certainly be higher if we vigorously maintained low cholesterol levels by eating vegan or semi-vegan diets.

Hemorrhagic stroke is much more dangerous than ischemic stroke. Victims of the former suffer greater neurological deficits, are more likely to be institutionalized, and are four times more likely to die within thirty days than victims of the latter. A recent comparison of the two types showed that only seven percent of ischemic stroke victims die within thirty days, whereas 28 percent of hemorrhagic stroke victims die within the same period of time.21 Moreover, low cholesterol levels are associated with decreased survival even from ischemic stroke. A Scottish study found that every 40 point decrease in serum cholesterol was associated with a nine percent increase in the risk of mortality for all types of stroke.22

In the MR FIT trial, involving over 350,000 men, stroke mortality was lowest among those with cholesterol levels between 180 and 200. Substantial increases in mortality occurred below 180 and above 240. The largest increases in mortality occurred among those with levels below 160 and over 300.13 Although these correlations do not demonstrate that the cholesterol levels actually cause the increase or decrease in risk, in the absence of a comprehensive understanding of causation they may justify optimizing these levels with exercise, nutritional supplements or moderation of carbohydrate intake. They cannot, however, justify a diet low in animal protein and fat when the evidence has consistently shown the consumption of these foods to be associated with an equal or lower risk of stroke.

In the Diet and Reinfarction Trial (DART), subjects who reduced their total fat intake and replaced saturated fat with polyunsaturated fat doubled their risk of suffering a fatal stroke.23 The reduction of total fat was small, from 35 percent of calories to 32 percent of calories. The increase in the polyunsaturated-to-saturated fat ratio was larger: it doubled from 0.4 to 0.8. These results taken together suggest that maintaining low

cholesterol levels with diets low in fat and saturated fat is likely to increase the risk and severity of stroke.

A Convenient Choice of Words

On February 20, 2007, Science Daily reported that researchers had shown total cholesterol levels to predict the risk of stroke in women. Women with the highest cholesterol levels, according to the article, had twice the risk of stroke as women with lower levels. The researchers claimed their findings underscored “the importance of cholesterol levels as a risk factor for stroke, even if you have no history of heart disease and are otherwise healthy.”8

The article left out one important fact: the study only looked at ischemic stroke.24 Did the women with high cholesterol levels have not only twice the risk of ischemic stroke but also half the risk of the much more dangerous and fatal hemorrhagic stroke? Was the incidence of total stroke any higher or lower in women with high cholesterol levels? We simply do not know; the study did not address the question.

Chronic Nitric Oxide Deficiency

Many dietary, lifestyle, and physiological factors directly or indirectly regulate nitric oxide levels. Nitric oxide relaxes blood vessels, increases blood flow and inhibits the formation of atherosclerotic plaque. A chronic deficiency of this compound may be among the most important causes of atherosclerosis and ischemic stroke.

The enzyme endothelial nitric oxide synthase (eNOS) produces nitric oxide within the lining of the blood vessels. Many factors regulate the production of this enzyme and thereby indirectly regulate the production of nitric oxide itself. Sheer stress stimulates the production of eNOS and may be an important mediator of the atherosclerotic process. The blood vessel lining experiences this type of stress as blood runs parallel to it. Exercise increases sheer stress because it causes the blood to move more vigorously, and thereby increases the production of eNOS.36 Atherosclerotic lesions tend to develop at specific sites where disturbed blood flow increases the force running perpendicular to the blood vessel lining and decreases the force running parallel to it.37

Oxidized LDL-cholesterol and insufficient oxygen decrease the production of eNOS. Free radicals are able to destroy nitric oxide itself after eNOS has synthesized it.38

The cellular enzyme Rho is capable of powerfully suppressing the production of eNOS. Ordinarily, the vast majority of Rho within a cell is inactivated. One of the products of the cholesterol synthesis pathway, geranylgeranyl pyrophosphate (GGPP), is responsible for activating it. Cellular enzymes synthesize GGPP from mevalonate. When the cell is producing more mevalonate than it uses for cholesterol synthesis, more GGPP is available for the activation of Rho (see Figure 1). Dietary nutrients such as cholesterol and magnesium, as well as the cholesterol that we synthesize ourselves, keep the production of mevalonate from exceeding the level needed by the cell.39

Inflammation, however, not only increases the production of mevalonate but inhibits its conversion to cholesterol. When researchers fed hamsters endotoxin, a proinflammatory chemical released from the breakdown of bacterial cell walls, it increased the production of mevalonate by a factor of ten but only increased the production of cholesterol by a factor of two.40 The result of chronic inflammation is a small excess of cholesterol and a much larger excess of other mevalonate products such as GGPP, which our cells then use to activate Rho.

Magnesium deficiency, chronic inflammation—and perhaps even a lack of dietary cholesterol—might contribute to chronic activation of Rho and suppression of nitric oxide synthesis. Inadequate exercise, excessive consumption of easily oxidized materials such as polyunsaturated fat and inadequate dietary antioxidants may further aggravate the deficiency of this important compound and thereby facilitate the atherosclerotic process and the impairment of blood flow that characterize an ischemic stroke.

Blood Pressure and Stroke

The overwhelmingly powerful and consistent risk factor for stroke is not high cholesterol but high blood pressure.

The 1980 report of the Honolulu Heart Study found the risk of ischemic stroke to increase with systolic blood pressure beginning at the lowest levels—the risk was lowest at levels under 121 millimeters mercury (mm Hg). The relationship of blood pressure to hemorrhagic stroke was similar but the lowest risk existed at levels between 122 and 134 mm Hg. The authors concluded that, “It seems to be a universal finding among all stroke epidemiology studies that the single most important risk factor for stroke, whether of cerebral infarction or intracranial hemorrhage, is hypertension.”15

In a 1995 report of the pooled results of 45 prospective studies involving 450,000 people, the risk of stroke had no association with cholesterol, but it increased consistently with diastolic blood pressure from the group with the lowest to the group with the highest. The difference was dramatic: subjects with a diastolic blood pressure of 102 mm Hg had five times the risk of stroke as those with a diastolic blood pressure of 75 mm Hg.5

In a 1998 report of the pooled results of 18 prospective studies conducted in eastern Asia involving nearly 125,000 people, the effect of blood pressure was even more pronounced. While serum cholesterol had modest but opposing associations with ischemic and hemorrhagic strokes that canceled each other out, the risk of both types of stroke increased consistently as diastolic blood pressure increased. Those with levels higher than 110 mm Hg had 13 times the risk of stroke as those with levels lower than 79 mm Hg.14

Clearly, maintaining optimal blood pressure is far more important to preventing stroke

than maintaining low cholesterol levels.

The Work Of Weston Price: Its Enduring Value

Weston Price promoted two theories about the relationship of nutrition and oral health to degenerative disease, which have long been ignored but have more recently gained support. In his earlier career, Price conducted 25 years of research demonstrating the ability of oral pathogens to cause cardiovascular and other systemic diseases. His work focused primarily on the tendency of the root canal procedure to facilitate this process.45 In his classic work on nutrition, Nutrition and Physical Degeneration, he connected nutritional status during development to deformities of the oral palate as well as to the risk of tuberculosis. Price believed that developmental deformities of the chest cavity—produced by the same nutritional causes as the deformities of the oral palate—made a person more vulnerable to the tuberculosis bacterium. For these reasons, he placed a special emphasis on the importance of nutritional preparation for and support of pregnancy and lactation—practices he universally observed among the healthy indigenous groups he studied.2 Modern science is now rediscovering the links between vascular disease and oral health and fetal nutrition.

Oral Health and Stroke

Recent research has been focusing on the association of vascular disease with periodontitis rather than with root canals, but nevertheless has been confirming the general principle observed by Price, namely that oral pathogens can cause systemic, degenerative diseases. Oral pathogens and immune cells specific to them inhabit arterial plaque. A number of studies have associated periodontitis with the severity of atherosclerosis and the incidence of heart disease and stroke. The pooled results of these studies conducted up to the year 2004 associate the presence of periodontitis with a 50 percent increase in the risk of ischemic stroke. Several studies have associated the presence of severe periodontitis with a nearly three-fold increase in risk of total stroke or fatal ischemic stroke. Among those strokes that are preceded by a fever, dental infection is associated with a nine-fold increase in risk.46

Preliminary evidence suggests that periodontitis increases the systemic marker of inflammation known as C-reactive protein as well as total and LDL-cholesterol. Intensive treatment of periodontitis using antibiotics decreases these levels when compared to standard treatment without antibiotics.47 Although it is possible that LDL and total cholesterol may be an important part of the body’s response to inflammation, it is also possible that their increase is largely coincident with the increase in mevalonate production used for other purposes, such as the activation of Rho, an important mediator of the stress response (see sidebar).

Oral pathogens may cause immune cells specific to them to directly adhere to the blood vessel lining and initiate atherosclerosis. By increasing the activation of Rho, however, we should also expect systemic inflammation to interfere with nitric oxide functioning and thereby contribute to atherosclerosis by a second mechanism.

Fetal Nutrition and Stroke

Recent research has focused on the association of fetal nutrition with certain physical deformities and the risk of vascular diseases rather than the risk of tuberculosis; nevertheless, this research confirms the general principle that early nutritional status has a lasting influence on the risk of degenerative disease. Inadequate nutrition during various stages of fetal development causes corresponding changes in various physical parameters; these parameters are in turn associated with the risk of diabetes, heart disease and stroke.
Soon after conception, inadequate nutrition causes the womb to reallocate cells from the fetus to the placenta in order to extract more nutrition from the blood supply of the mother; the inevitable result is a loss of raw material from which to generate fetal tissue. During later stages of growth, the fetus compensates for inadequate nutrition by sacrificing the supply of nutrients to muscles and internal organs such as the liver and pancreas in favor of supplying the brain; the exception is the left ventricle of the heart, which may grow larger than is normal in order to pump hard enough to supply the brain with extra blood. This general pattern of compensation results in a reduced ratio of body length to head circumference (that is, short stature with a proportionately larger head).48

Excluding premature births, low birth weight is associated with a three-fold increase in the risk of type-2 diabetes, a two-fold increase in the risk of heart disease and a modest increase in life-long blood pressure. A reduced length-to-head circumference ratio is associated with defects in the regulation of cholesterol and blood clotting metabolism. One study found stroke mortality to be more common among men who were born to mothers with flat, bony pelvises (considered abnormal), suggesting a relationship between the mother's childhood nutrition and her offspring's risk of stroke.48

These findings illustrate the enduring importance of Price's research and the benefits that would accrue should modern science incorporate his research into the paradigm with which it approaches questions of health and disease.

Cholesterol Lowering and Lowfat Diets for Children

Written by Mary G. Enig, PhD
Friday, March 13 2009 09:28
http://www.westonaprice.org/know-your-fats...ts-for-children

The American Academy of Pediatrics recommends that children two years old and older should eat a diet of fruits, vegetables, whole grains, lowfat and non-fat dairy products, beans, fish and lean meats. The guidelines also recommend very low amounts of saturated and trans fats. The “experts” are increasingly urging strict adherence to this diet in children. “The idea that heart disease starts in the 50s has been substantially discounted,” says Dr. Robert Eckel of the University of Colorado and former president of the American Heart Association. “Saturated fat is always an enemy to the arteries, at any age.”1

I have described some of the harmful consequences of lowfat diets for growing children in previous columns (see westonaprice.org/knowyourfats/diet_children.html). The purported rationale for putting children on fat-restricted diets involves preventing future obesity and heart disease. Yet one study indicates that children put on lowfat diets actually develop markers for heart disease. Children on lowfat diets whose genes would normally have been producing the desirable light and fluffy form of LDL-cholesterol started to make the dangerous small and dense form of LDL.2
Lowfat Diets For Children?

Promoters of lowfat diets have seen to it that whole milk has been virtually eliminated in schools. This new policy is predicated on the assumption that the fat in whole milk will make children become fat. Yet a recent study on children in Sweden revealed that lower fat intake was associated with higher body mass index and greater insulin resistance.3 Children on lowfat diets also consumed more sugar. Since the beverage

choice for American children in schools today is either reduced-fat milk or chocolate milk, greater sugar consumption will no doubt be a consequence of the fat-restriction policy.

More cause for alarm comes from another recent study, this one published in Human Reproduction.4 The risk of anovulatory infertility was found to be 27 percent lower in women who ate at least one portion of high-fat dairy food per day compared with women who had one high-fat serving of dairy per week, or even less. Women who ate two or more portions of lowfat dairy foods a day increased their risk of ovulationrelated infertility by 85 percent.

The researchers concluded that women who want to get pregnant should consume high-fat dairy products but, once pregnant, switch back to lowfat foods. The assumption is that ovulation can be restored in adult women by switching from lowfat to full-fat dairy products. But what happens in girls who are denied healthy dairy fats throughout childhood, even, it seems, in the womb? Will they be able to become pregnant by consuming full-fat dairy products for the first time when they are adults? This is a dangerous assumption to make since the vitamins in dairy fats are essential for the development of the reproductive system throughout the growing years.

Some researchers are urging caution. Dr. John Kostyak and a team from Pennsylvania State University recently warned in the online magazine Nutrition Journal that so-called “muesli mothers” are taking adult dietary messages to extremes and inflicting them on their children. “Sufficient fat must be included in the diet for children to support normal growth and development,” says Kostyak. Unfortunately, the fats he recommends are the “good fats,” such as olive oil and sunflower oil. However, some commentators are urging full-fat dairy products for children under five—contradicting US government policy that urges restriction of dairy fats after the age of two.5

Cholesterol Lowering

The pharmaceutical industry seems intent on putting growing children on cholesterol-lowering drugs, with a carefully orchestrated campaign that first targets children with a condition called hereditary familial hypercholesterolemia, chronic “high” cholesterol levels of genetic origin. In a recently published meta-analysis, researchers reported no side effects in children given cholesterol-lowering statin drugs compared to a placebo.6 With the drugs, they were able to reduce total cholesterol by 25 percent and LDLcholesterol by 30 percent. The report contains a number of caveats—namely that longer-term studies are needed, as current studies have only examined possible side effects such as growth problems and retarded sexual development for a period of one or two years. Nevertheless, the author, Dr. Barbara A. Hutten from Academic Medical Center, Amsterdam, Netherlands, stated with confidence, “When a child has been diagnosed with heterozygous familial hypercholesterolemia, statin treatment should be considered for all children older than eight years.”

Not content with statin therapy for the small percentage of children with hereditary familial hypercholesterolemia, the American Heart Association now endorses statin treatment in children for a variety of risk factors: ". . . just as with adults, there are certain risk factors in children that may call for more aggressive treatment."7 The National Cholesterol Education Program (NCEP) has drawn up new guidelines that would include diabetes, overweight and a family history of cardiovascular disease, as well as familial hypercholesterolemia, as risk factors in children that could be treated with statins. Even "male gender" has been singled out as a risk factor! NCEP estimates that under these guidelines, from 36 to 46 percent of children and adolescents would be targeted for cholesterol-lowering measures, which could include statin treatment. Although the American Heart Association statement notes that "There is a real need for ongoing research regarding drug therapy of high risk lipid abnormalities in children, particularly regarding long-term efficacy and safety [emphasis mine]," it seems clear that plans to lower cholesterol in children are going forward.

A Note Of Caution

A note of caution comes from the expert committee of the US Preventive Services Task Force.8 The committee examined randomized, control clinical trials and all available evidence, carefully considering ten key questions concerning the effectiveness, risks and accuracy of screening; the effectiveness and risks of diet, drug and exercise interventions for managing cholesterol and preventing cardiovascular disease; and whether reducing blood cholesterol levels in youth reduces the risk of high cholesterol and cardiovascular disease in adulthood. Their conclusion: "The evidence is insufficient to recommend for or against routine screening for lipid disorders in infants, children, adolescents, or young adults (up to age 20). Evidence for effectiveness is lacking, of poor quality, or conflicting, and the balance of benefits and harms can not be determined."

The committee raised serious concerns about side effects. They found evidence of growth failure, nutritional dwarfing and inhibited progression of puberty in children on fat-restricted diets. They also reported that "lower fat intake was associated with lower levels of calcium, zinc, magnesium, phosphorus, vitamin E, vitamin B12, thiamine, niacin and riboflavin."

As for prescribing statin drugs to children, the committee noted that these drugs have FDA approval for use in children only in cases of familial hypercholesterolemia. "There is no evidence that diet or exercise interventions in childhood lead to improved lipid profiles or better health outcomes in adulthood." Furthermore, statin drugs also have side effects, including liver damage, gastrointestinal problems and decreased absorption of vitamins and minerals.

Unfortunately, this report received scant publicity and will probably do little to stop the anti-cholesterol campaign in children. As a result, well-meaning parents and health officials will continue to apply cholesterol- lowering measures to young people—

including starving them of nutrients—in the mistaken belief that they are protecting their health.

Diet Foods May Cause Weight Gain

As health officials continue to harp on the dangers of weight gain, parents are increasingly likely to give low-calorie products to their children. But studies with rats provide further evidence of the folly of this policy. Young animals given low-calorie version of foods ended up overeating, whether they were lean or obese; however, older adolescent rats fed diet foods did not show the same tendency to overeat.9 “Diet foods are probably not a good idea for growing youngsters,” said Professor David Pierce, head of the study. But that is exactly what the “experts” recommend—lowfat versions of dairy products and meat, and a restriction of animal fats like butter.

Can Cholesterol Protect Against Fetal Alcohol Syndrome?

Fetal Alcohol Spectrum Defects (FASD) includes numerous abnormalities, such as neurological, craniofacial and cardiac malformations. In studies with zebra fish, researchers found that alcohol interferes with embryonic development by disrupting cholesterol-dependent activation of a critical signaling molecule. But with cholesterol supplementation of the alcohol-exposed embryos, FASD-like defects were prevented. The defects resulted from minimal alcohol exposure, equivalent to a 120-pound woman drinking one 12-ounce beer.10 This study raises the specter of increased FASD in human children as a result of lowfat diets for pregnant women.

About the Author

Mary G. Enig, PhD is an expert of international renown in the field of lipid biochemistry. She has headed a number of studies on the content and effects of trans fatty acids in America and Israel, and has successfully challenged government assertions that dietary animal fat causes cancer and heart disease. Recent scientific and media attention on

the possible adverse health effects of trans fatty acids has brought increased attention to her work. She is a licensed nutritionist, certified by the Certification Board for Nutrition Specialists, a qualified expert witness, nutrition consultant to individuals, industry and state and federal governments, contributing editor to a number of scientific publications, Fellow of the American College of Nutrition and President of the Maryland Nutritionists Association. She is the author of over 60 technical papers and presentations, as well as a popular lecturer. Dr. Enig is currently working on the exploratory development of an adjunct therapy for AIDS using complete medium chain saturated fatty acids from whole foods. She is Vice-President of the Weston A Price Foundation and Scientific Editor of Wise Traditions as well as the author of Know Your Fats: The Complete Primer for Understanding the Nutrition of Fats, Oils, and Cholesterol, Bethesda Press, May 2000. She is the mother of three healthy children brought up on whole foods including butter, cream, eggs and meat.

http://www.westonaprice.org/know-your-fats...l-friend-or-foe

The art of medicine consists in amusing the patient while nature cures the disease. -- Voltaire

In our modern world, cholesterol has become almost a swear word. Thanks to the promoters of the diet-heart hypothesis, everybody "knows" that cholesterol is "evil" and has to be fought at every turn. If you believe the popular media, you would think that there is simply no level of cholesterol low enough. If you are over a certain age, you are likely to be tested for how much cholesterol you have in your blood. If it is higher than about 200 mg/100ml (5.1 mol/l), you may be prescribed a "cholesterol pill." Millions of people around the world take these pills, thinking that this way they are taking good care of their health. What these people don't realize is just how far from the truth they are. The truth is that we humans cannot live without cholesterol. Let us see why.

Our bodies are made out of billions of cells. Almost every cell produces cholesterol all the time during all of our lives. Why? Because every cell of every organ has cholesterol as a part of its structure. Cholesterol is an integral and very important part of our cell membranes, the membranes that enclose each of our cells, and also of the membranes surrounding all the organelles inside the cell. What is cholesterol doing there? A number of things.
Structural Integrity

First of all, saturated fats and cholesterol make the membranes of the cells firm—without them the cells would become flabby and fluid. If we humans didn't have cholesterol and saturated fats in the membranes of our cells, we would look like giant

worms or slugs. And we are not talking about a few molecules of cholesterol here and there. In many cells, almost half of the cell membrane is made from cholesterol. Different kinds of cells in the body need different amounts of cholesterol, depending on their function and purpose. If the cell is part of a protective barrier, it will have a lot of cholesterol in it to make it strong, sturdy and resistant to any invasion. If a cell or an organelle inside the cell needs to be soft and fluid, it will have less cholesterol in its structure.

This ability of cholesterol and saturated fats to firm up and reinforce the tissues in the body is used by our blood vessels, particularly those that have to withstand the high pressure and turbulence of the blood flow. These are usually large or medium arteries in places where they divide or bend. The flow of blood pounding through these arteries forces them to incorporate a layer of cholesterol and saturated fat in the membranes, which makes it stronger, tougher and more rigid. These layers of cholesterol and fat are called fatty streaks. They are completely normal and form in all of us, starting from birth and sometimes even before we are born. Various indigenous populations around the world, who never suffer from heart disease, have plenty of fatty streaks in their blood vessels in old and young, including children. Fatty streaks are not indicative of the disease called atherosclerosis.
Lipid Lifesavers

All the cells in our bodies have to communicate with each other. How do they do that? They use proteins embedded into the membrane of the cell. How are these proteins fixed to the membrane? With the help of cholesterol and saturated fats! Cholesterol and stiff saturated fatty acids form so-called lipid rafts, which make little homes for every protein in the membrane and allow it to perform its functions. Without cholesterol and saturated fats, our cells would not be able to communicate with each other or to transport various molecules into and out of the cell. As a result, our bodies would not be able to function the way they do. The human brain is particularly rich in cholesterol: around 25 percent of all body cholesterol is accounted for by the brain. Every cell and every structure in the brain and the rest of our nervous system needs cholesterol, not only to build itself but also to accomplish its many functions. The developing brain and eyes of the fetus and a newborn infant require large amounts of cholesterol. If the fetus doesn’t get enough cholesterol during development, the child may be born with a congenital abnormality called cyclopean eye.1

Human breast milk provides a lot of cholesterol. Not only that, mother’s milk provides a specific enzyme to allow the baby’s digestive tract to absorb almost 100 percent of that cholesterol, because the developing brain and eyes of an infant require large amounts of it. Children deprived of cholesterol in infancy may end up with poor eyesight and brain function. Manufacturers of infant formulas are aware of this fact, but following the anti-cholesterol dogma, they produce formulas with virtually no cholesterol in them.
Vital Brain Matter

One of the most abundant materials in the brain and the rest of our nervous system is a fatty substance called myelin. Myelin coats every nerve cell and every nerve fiber like the insulating cover around electric wires. Apart from insulation, it provides nourishment and protection for every tiny structure in our brain and the rest of the nervous system. People who start losing their myelin develop a condition called multiple sclerosis. Well, 20 percent of myelin is cholesterol. If you start interfering with the body's ability to produce cholesterol, you put the very structure of the brain and the rest of the nervous system under threat.

The synthesis of myelin in the brain is tightly connected with the synthesis of cholesterol. In my clinical experience, foods with high cholesterol and high animal fat content are an essential medicine for a person with multiple sclerosis. One of the most wonderful abilities we humans are blessed with is the ability to remember things—our human memory. How do we form memories? By our brain cells establishing connections with each other, called synapses. The more healthy synapses a person's brain can make, the more mentally able and intelligent that person is. Scientists have discovered that synapse formation is almost entirely dependent on cholesterol, which is produced by the brain cells in a form called apolipoprotein E. Without the presence of this factor we cannot form synapses, and hence we would not be able to learn or remember anything. Memory loss is one of the side effects of cholesterol-lowering drugs.

In my clinic, I see growing numbers of people with memory loss who have been taking cholesterol- lowering pills. Dr Duane Graveline, MD, former NASA scientist and astronaut, suffered such memory loss while taking his cholesterol pill. He managed to save his memory by stopping the pill and eating lots of cholesterol-rich foods. Since then he has described his experience in his book, Lipitor: Thief of Memory, Statin Drugs and the Misguided War on Cholesterol. Dietary cholesterol in fresh eggs and other cholesterol-rich foods has been shown in scientific trials to improve memory in the elderly. In my clinical experience, any person with memory loss or learning problems needs to have plenty of these foods every single day in order to recover.
Necessary Product Of The Body

These foods give the body a hand in supplying cholesterol so it does not have to work as hard to produce its own. What a lot of people don't realize is that most cholesterol in the body does not come from food! The body produces cholesterol as it is needed. Scientific studies have conclusively demonstrated that cholesterol from food has no effect whatsoever on the level of our blood cholesterol. Why? Because cholesterol is such an essential part of our human physiology that the body has very efficient mechanisms to keep blood cholesterol at a certain level.

When we eat more cholesterol, the body produces less; when we eat less cholesterol, the body produces more. As a raw material for making cholesterol the body can use carbohydrates, proteins and fats, which means that your pasta and bread can be used

for making cholesterol in the body. It has been estimated that, in an average person, about 85 percent of blood cholesterol is produced by the body, while only 15 percent comes from food. So, even if you religiously follow a completely cholesterol-free diet, you will still have a lot of cholesterol in your body. However, cholesterol-lowering drugs are a completely different matter! They interfere with the body's ability to produce cholesterol, and hence they do reduce the amount of cholesterol available for the body to use.

Dangers Of Low Cholesterol

If we do not take cholesterol-lowering drugs, most of us don't have to worry about cholesterol. However, there are people whose bodies, for whatever reason, are unable to produce enough cholesterol. These people are prone to emotional instability and behavioral problems. Low blood cholesterol has been routinely recorded in criminals who have committed murder and other violent crimes, people with aggressive and violent personalities, people prone to suicide and people with aggressive social behavior and low self-control.

I would like to repeat what the late Oxford professor David Horrobin warned us about: "Reducing cholesterol in the population on a large scale could lead to a general shift to more violent patterns of behavior. Most of this increased violence would not result in death but in more aggression at work and in the family, more child abuse, more wife-beating and generally more unhappiness."

People whose bodies are unable to produce enough cholesterol do need to have plenty of foods rich in cholesterol in order to provide their organs with this essential-to-life substance.

What else does our body need all that cholesterol for?

Endocrine System

After the brain, the organs hungriest for cholesterol are our endocrine glands: adrenals and sex glands. They produce steroid hormones. Steroid hormones in the body are made from cholesterol: testosterone, progesterone, pregnenolone, androsterone, estrone, estradiol, corticosterone, aldosterone and others. These hormones accomplish a myriad of functions in the body, from regulation of our metabolism, energy production, mineral assimilation, brain, muscle and bone formation to behavior, emotions and reproduction. In our stressful modern lives we consume a lot of these hormones, leading to a condition called "adrenal exhaustion." This condition is diagnosed very often by naturopaths and other health practitioners. There are many herbal preparations on the market for adrenal exhaustion. However, the most important therapeutic measure is to provide your adrenal glands with plenty of dietary cholesterol.

Without cholesterol we would not be able to have children because every sex hormone in our bodies is made from cholesterol. A fair percentage of our infertility epidemic can

be laid at the doorstep of the diet-heart hypothesis. The more eager we became to fight animal fats and cholesterol, the more problems with normal sexual development, fertility and reproduction we started to face. About a third of western men and women are infertile, and increasing numbers of our youngsters are growing up with abnormalities in their sex hormones. These abnormalities lead to many physical problems.

Recent research has "discovered" that eating full-cream dairy products cures infertility in women.2 Researchers found that women who drink whole milk and eat high-fat dairy products are more fertile than those who stick to low-fat products. Study leader Dr Jorge Chavarro, of the Harvard School of Public Health, emphasized: "Women wanting to conceive should examine their diet. They should consider changing low-fat dairy foods for high-fat dairy foods, for instance by swapping skimmed milk for whole milk and eating cream, not low-fat yoghurt."
The Liver And Vitamin Regulation

One of the busiest organs in terms of cholesterol production in our bodies is the liver, which regulates the level of our blood cholesterol. The liver also puts a lot of cholesterol into bile production. Yes, bile is made out of cholesterol. Without bile we would not be able to digest and absorb fats and fat-soluble vitamins. Bile emulsifies fats; in other words, it mixes them with water, so that digestive enzymes can get to them. After it completes its mission, most of the bile gets reabsorbed in the digestive system and brought back to the liver for recycling. In fact, 95 percent of our bile is recycled because the building blocks of bile, one of which is cholesterol, are too precious for the body to waste. Nature doesn’t do anything without good reason. This example of the careful recycling of cholesterol alone should have given us a good idea about its importance for the body!

Bile is essential for absorbing fat-soluble vitamins: vitamin A, vitamin D, vitamin K and vitamin E. We cannot live without these vitamins. Apart from ensuring that fat-soluble vitamins get digested and absorbed properly, cholesterol is the major building block of one of these vitamins: vitamin D. Vitamin D is made from the cholesterol in our skin when it is exposed to sunlight. In those times of the year when there isn’t much sunlight, we can get this vitamin from cholesterol-rich foods: cod liver oil, fish, shellfish, butter, lard and egg yolks. Our recent misguided fears of the sun and avoidance of cholesterol-rich foods have created an epidemic of vitamin D deficiency in the Western world.

Unfortunately, apart from sunlight and cholesterol-rich foods there is no other appropriate way to get vitamin D. Of course, there are supplements, but most of them contain vitamin D2, which is made by irradiating mushrooms and other plants. This vitamin is not the same as the natural vitamin D. It does not work as effectively and it is easy to get a toxic level of it. In fact, almost all cases of vitamin D toxicity ever recorded were cases where this synthetic vitamin D2 had been used. Toxicity is almost impossible with natural vitamin D obtained from sunlight or cholesterol-rich foods because the body knows how to deal with an excess of natural substances. What the

body does not know how to deal with is an excess of synthetic vitamin D2.

Vitamin D has been designed to work as a team with another fat-soluble vitamin: vitamin A. That is why foods rich in one tend to be rich in the other. So, by taking cod liver oil, for example, we can obtain both vitamins at the same time. As we grow older, our ability to produce vitamin D in the skin under sunlight is considerably diminished. Taking foods rich in vitamin D is therefore particularly important for older people. For the rest of us, sensible sunbathing is a wonderful, healthy and enjoyable way of getting a good supply of vitamin D.

Skin cancer, blamed on sunshine, is not caused by the sun. It is caused by trans fats from vegetable oils and margarine and other toxins stored in the skin. In addition, some of the sunscreens that people use contain chemicals that have been proven to cause skin cancer3.
Immune System Health

Cholesterol is essential for our immune system to function properly. Animal experiments and human studies have demonstrated that immune cells rely on cholesterol in fighting infections and repairing themselves after the fight. In addition, LDL-cholesterol (low-density lipoprotein cholesterol), the so-called "bad" cholesterol, directly binds and inactivates dangerous bacterial toxins, preventing them from doing any damage in the body. One of the most lethal toxins is produced by a widely spread bacterium, Staphylococcus aureus, which is the cause of MRSA (Methicillin- resistant Staphylococcus aureus), a common hospital infection. This toxin can literally dissolve red blood cells. However, it does not work in the presence of LDL-cholesterol. People who fall prey to this toxin have low blood cholesterol. It has been recorded that people with high levels of cholesterol are protected from infections; they are four times less likely to contract AIDS, they rarely get common colds and they recover from infections more quickly than people with "normal" or low blood cholesterol.

People with low blood cholesterol are prone to various infections, suffer from them longer and are more likely to die from an infection. A diet rich in cholesterol has been demonstrated to improve these people’s ability to recover from infections. So, any person suffering from an acute or chronic infection needs to eat high-cholesterol foods to recover. Cod liver oil, the richest source of cholesterol (after caviar), has long been prized as the best remedy for the immune system. Those familiar with old medical literature will tell you that until the discovery of antibiotics, a common cure for tuberculosis was a daily mixture of raw egg yolks and fresh cream.
Varying Blood Cholesterol Levels

The question is, why do some people have more cholesterol in their blood than others, and why can the same person have different levels of cholesterol at different times of the day? Why is our level of cholesterol different in different seasons of the year? In winter it goes up and in the summer it goes down. Why is it that blood cholesterol goes

through the roof in people after any surgery? Why does blood cholesterol go up when we have an infection? Why does it go up after dental treatment? Why does it go up when we are under stress? And why does it become normal when we are relaxed and feel well? The answer to all these questions is this: cholesterol is a healing agent in the body. When the body has some healing jobs to do, it produces cholesterol and sends it to the site of the damage. Depending on the time of day, the weather, the season and our exposure to various environmental agents, the damage to various tissues in the body varies. As a result, the production of cholesterol in the body also varies.

Since cholesterol is usually discussed in the context of disease and atherosclerosis, let us look at the blood vessels. Their inside walls are covered by a layer of cells called the endothelium. Any damaging agent we are exposed to will finish up in our bloodstream, whether it is a toxic chemical, an infectious organism, a free radical or anything else. Once such an agent is in the blood, what is it going to attack first? The endothelium, of course. The endothelium immediately sends a message to the liver. Whenever our liver receives a signal that a wound has been inflicted upon the endothelium somewhere in our vascular system, it gets into gear and sends cholesterol to the site of the damage in a shuttle, called LDL-cholesterol. Because this cholesterol travels from the liver to the wound in the form of LDL, our "science," in its wisdom calls LDL "bad" cholesterol. When the wound heals and the cholesterol is removed, it travels back to the liver in the form of HDLcholesterol (high-density lipoprotein cholesterol). Because this cholesterol travels away from the artery back to the liver, our misguided "science" calls it "good" cholesterol. This is like calling an ambulance travelling from the hospital to the patient a "bad ambulance," and the one travelling from the patient back to the hospital a "good ambulance."

But the situation has gotten even more ridiculous. The latest thing that our science has "discovered" is that not all LDL-cholesterol is so bad. Most of it is actually good. So, now we are told to call that part of LDL the "good bad cholesterol" and the rest of it the "bad bad cholesterol."
Marvelous Healing Agent

Why does the liver send cholesterol to the site of the injury? Because the body cannot clear the infection, remove toxic elements or heal the wound without cholesterol and fats. Any healing involves the birth, growth and functioning of thousands of cells: immune cells, endothelial cells and many others. As these cells, to a considerable degree, are made out of cholesterol and fats, they cannot form and grow without a good supply of these substances. When the cells are damaged, they require cholesterol and fats to repair themselves. It is a scientific fact that any scar tissue in the body contains good amounts of cholesterol.4

Another scientific fact is that cholesterol acts as an antioxidant in the body, dealing with free radical damage.5 Any wound in the body contains plenty of free radicals because the immune cells use these highly reactive molecules for destroying microbes and

toxins. Excess free radicals have to be neutralized, and cholesterol is one of the natural substances that accomplishes this function.

When we have surgery, our tissues are cut and many small arteries, veins and capillaries get damaged. The liver receives a very strong signal from this damage, so it floods the body with LDL-cholesterol to clean and heal every little wound in our blood vessels. That is why blood cholesterol goes high after any surgical procedure. After dental treatment, in addition to the damage to the tissues, a lot of bacteria from the tooth and the gums finish up in the blood, attacking the inside walls of our blood vessels. Once again, the liver gets a strong signal from that damage and produces lots of healing cholesterol to deal with it, so the blood cholesterol goes up.

The same thing happens when we have an infection: LDL-cholesterol goes up to deal with the bacterial or viral attack.

Apart from the endothelium, our immune cells need cholesterol to function and to heal themselves after the fight with the infection.

Our stress hormones are made out of cholesterol in the body. Stressful situations increase our blood cholesterol levels because cholesterol is being sent to the adrenal glands for stress hormone production. Apart from that, when we are under stress, a storm of free radicals and other damaging biochemical reactions occur in the blood. So the liver works hard to produce and send out as much cholesterol as possible to deal with the free radical attack. In situations like this, your blood cholesterol will test high. In short, when we have a high blood cholesterol level, it means that the body is dealing with some kind of damage. The last thing we should do is interfere with this process! When the damage has been dealt with, the blood cholesterol will naturally go down. If we have an ongoing disease in the body that constantly inflicts damage, then the blood cholesterol will be permanently high. So, when a doctor finds high cholesterol in a patient, what this doctor should do is to look for the reason. The doctor should ask, "What is damaging the body so that the liver has to produce all that cholesterol to deal with the damage?" Unfortunately, instead of this sensible procedure, our doctors are trained to attack the cholesterol.

Many natural herbs, antioxidants and vitamins have an ability to reduce our blood cholesterol. How do they do that? By helping the body remove the damaging agents, be they free radicals, bacteria, viruses or toxins. As a result, the liver does not have to produce so much cholesterol to deal with the damage. At the same time, vitamins, minerals, antioxidants, herbs and other natural remedies help to heal the wound. When the wound heals there is no need for high levels of cholesterol anymore, so the body removes it in the form of HDL-cholesterol or so-called "good" cholesterol. That is why herbs, vitamins, antioxidants and other natural remedies increase the level of HDL-cholesterol in the blood.

In conclusion, cholesterol is one of the most important substances in the body. We cannot live without it, let alone function well. The pernicious diet-heart hypothesis has vilified this essential substance. Unfortunately, this hypothesis has served many commercial and political interests far too well, so they ensure its long survival. However, the life of the diet-heart hypothesis is coming to an end as we become aware that cholesterol has been mistakenly blamed for the crime just because it was found at the scene.

Sidebars
Dietary Sources Of Cholesterol
Caviar is the richest source; it provides 588 mg of cholesterol per 100 grams. Obviously, this is not a common food for the majority of us, so let us have a look at the next item on the list.
Cod liver oil follows closely with 570 mg of cholesterol per 100 grams. There is no doubt that the cholesterol element of cod liver oil plays an important role in all the well-known health benefits of this time-honored health food.
Fresh egg yolk takes third place, with 424 mg of cholesterol per 100 gram. I would like to repeat: fresh egg yolk, not chemically mutilated egg powders (they contain chemically mutilated cholesterol)!
Butter provides a good 218 mg of cholesterol per 100 gram. We are talking about natural butter, not butter substitutes.
Cold-water fish and shellfish, such as salmon, sardines, mackerel and shrimps, provide good amounts of cholesterol, ranging from 173 mg to 81 mg per 100 gram. The proponents of low-cholesterol diets tell you to replace meats with fish. Obviously, they are not aware of the fact that fish is almost twice as rich in cholesterol as meat.
Lard provides 94 mg of cholesterol per 100 gram. Other animal fats follow.
Vitamin D Deficiency

What does it mean for our bodies to be deficient in vitamin D? A long list of suffering:
Diabetes, as vitamin D is essential for blood sugar control
Heart disease
Mental illness
Auto-immune illness, such as rheumatoid arthritis, lupus, inflammatory bowel disease and multiple sclerosis
Obesity
Osteoarthritis
Rickets and osteomalacia
Muscle weakness and poor neuro-muscular coordination
High blood pressure
Cancer
Chronic pain
Poor immunity and susceptibility to infections
Hyperparathyroidism, which manifests itself as osteoporosis, kidney stones,

depression, aches and pains, chronic fatigue, muscle weakness and digestive abnormalities

About the Author

Natasha Campbell-McBride, MD, MMedSci (neurology), MMedSci (nutrition), graduated with honors as a medical doctor in 1984 from Bashkir Medical University in Russia. In the following years she gained a postgraduate degree in neurology.After practicing for five years as a neurologist and three years as a neurosurgeon, she started a family and moved to the UK. Fairly shortly after that her son was diagnosed autistic, which prompted an intensive study into causes and treatments of autism. It was during this time that Dr. Campbell-McBride developed her theories on the relationship between neurological disorders and nutrition. She then completed a second postgraduate degree in human nutrition at Sheffield University, UK.

Having successfully treated her son, Dr. Campbell-McBride has returned to practice in 2000 and runs the Cambridge Nutrition Clinic. She has specialized in using nutritional approach as a treatment, and has become recognized as one of the world's leading experts in treating children and adults with learning disabilities and other mental disorders, as well as children and adults with digestive and immune disorders.

In 2004 she has published Gut and Psychology Syndrome: Natural Treatment Of Autism, ADHD, Dyslexia, Dyspraxia, Depression and Schizophrenia, in which she explores the connection between the patient's physical state and brain function. The

book gives full details of the GAPS Nutritional Protocol, highly successful in treating patients with learning disabilities and other mental problems.

In her clinic, Dr Campbell-McBride works with many patients suffering from heart disease, high blood pressure, arrhythmia, stroke and other complications of atherosclerosis. She has become acutely aware of the existing confusion about nutrition and these conditions, which spurred an intensive study into this subject. The result of this study is her new book Put You Heart In Your Mouth! What Really Is Heart Disease and What We Can Do To Prevent and Even Reverse It.

Dr Campbell-McBride is a keynote speaker at many professional conferences and seminars around the world. She frequently gives talks to health practitioners, patient groups and associations. She is a member of the Society of Authors and a regular contributing health editor to a number of magazines and newsletters.

The truth about saturated fats

by Mary Enig, PhD, and Sally Fallon
http://www.health-report.co.uk/saturated_f...th_benefits.htm

Saturated fats from animal and vegetable sources provide a concentrated source of energy in the diet; they also provide the building blocks for cell membranes and a variety of hormones and hormonelike substances. Fats as part of a meal slow down absorption so that we can go longer without feeling hungry. In addition, they act as carriers for important fat-soluble vitamins A, D, E and K. Dietary fats are needed for the conversion of carotene to vitamin A, for mineral absorption and for a host of other processes.

Politically Correct Nutrition is based on the assumption that we should reduce our intake of fats, particularly saturated fats from animal sources. Fats from animal sources also contain cholesterol, presented as the twin villain of the civilized diet.
The Lipid Hypothesis

The theory—called the lipid hypothesis—that there is a direct relationship between the amount of saturated fat and cholesterol in the diet and the incidence of coronary heart disease was proposed by a researcher named Ancel Keys in the late 1950's. Numerous subsequent studies have questioned his data and conclusions. Nevertheless, Keys' articles received far more publicity than those presenting alternate views. The vegetable oil and food processing industries, the main beneficiaries of any research that found fault with competing traditional foods, began promoting and funding further research designed to support the lipid hypothesis.

The most well-known advocate of the lowfat diet was Nathan Pritikin. Actually, Pritikin advocated elimination of sugar, white flour and all processed foods from the diet and recommended the use of fresh raw foods, whole grains and a strenuous exercise

program; but it was the lowfat aspects of his regime that received the most attention in the media. Adherents found that they lost weight and that their blood cholesterol levels and blood pressure declined. The success of the Pritikin diet was probably due to a number of factors having nothing to do with reduction in dietary fat—weight loss alone, for example, will precipitate a reduction in blood cholesterol levels—but Pritikin soon found that the fat-free diet presented many problems, not the least of which was the fact that people just could not stay on it. Those who possessed enough will power to remain fat-free for any length of time developed a variety of health problems including low energy, difficulty in concentration, depression, weight gain and mineral deficiencies.1 Pritikin may have saved himself from heart disease but his lowfat diet did not spare him from cancer. He died, in the prime of life, of suicide when he realized that his Spartan regime was not curing his leukemia. We shouldn't have to die of either heart disease or cancer—or consume a diet that makes us depressed.

When problems with the no-fat regime became apparent, Pritikin introduced a small amount of fat from vegetable sources into his diet—something like 10% of the total caloric intake. Today the Diet Dictocrats advise us to limit fats to 25-30% of the caloric intake, which is about 2 1/2 ounces or 5 tablespoons per day for a diet of 2400 calories. A careful reckoning of fat intake and avoidance of animal fats, they say, is the key to perfect health.
The "evidence" supporting the Lipid Hypothesis

These "experts" assure us that the lipid hypothesis is backed by incontrovertible scientific proof. Most people would be surprised to learn that there is, in fact, very little evidence to support the contention that a diet low in cholesterol and saturated fat actually reduces death from heart disease or in any way increases one's life span. Consider the following:

Before 1920 coronary heart disease was rare in America; so rare that when a young internist named Paul Dudley White introduced the German electrocardiograph to his colleagues at Harvard University, they advised him to concentrate on a more profitable branch of medicine. The new machine revealed the presence of arterial blockages, thus permitting early diagnosis of coronary heart disease. But in those days clogged arteries were a medical rarity, and White had to search for patients who could benefit from his new technology. During the next forty years, however, the incidence of coronary heart disease rose dramatically, so much so that by the mid fifties heart disease was the leading cause of death among Americans. Today heart disease causes at least 40% of all US deaths. If, as we have been told, heart disease results from the consumption of saturated fats, one would expect to find a corresponding increase in animal fat in the American diet. Actually, the reverse is true. During the sixty-year period from 1910 to 1970, the proportion of traditional animal fat in the American diet declined from 83% to 62%, and butter consumption plummeted from eighteen pounds per person per year to four. During the past eighty years, dietary cholesterol intake has increased only 1%. During the same period the percentage of dietary vegetable oils in the form of

margarine, shortening and refined oils increased about 400% while the consumption of sugar and processed foods increased about 60%.2

The Framingham Heart Study is often cited as proof of the lipid hypothesis. This study began in 1948 and involved some 6,000 people from the town of Framingham, Massachusetts. Two groups were compared at five-year intervals—those who consumed little cholesterol and saturated fat and those who consumed large amounts. After 40 years, the director of this study had to admit: "In Framingham, Mass, the more saturated fat one ate, the more cholesterol one ate, the more calories one ate, the lower the person's serum cholesterol. . . we found that the people who ate the most cholesterol, ate the most saturated fat, ate the most calories, weighed the least and were the most physically active."3 The study did show that those who weighed more and had abnormally high blood cholesterol levels were slightly more at risk for future heart disease; but weight gain and cholesterol levels had an inverse correlation with fat and cholesterol intake in the diet.4

In a multi-year British study involving several thousand men, half were asked to reduce saturated fat and cholesterol in their diets, to stop smoking and to increase the amounts of unsaturated oils such as margarine and vegetable oils. After one year, those on the "good" diet had 100% more deaths than those on the "bad" diet, in spite of the fact that those men on the "bad" diet continued to smoke! But in describing the study, the author ignored these results in favor of the politically correct conclusion: "The implication for public health policy in the U.K. is that a preventive programme such as we evaluated in this trial is probably effective. . . ."5

The U.S. Multiple Risk Factor Intervention Trial, (MRFIT) sponsored by the National Heart, Lung and Blood Institute, compared mortality rates and eating habits of over 12,000 men. Those with "good" dietary habits (reduced saturated fat and cholesterol, reduced smoking, etc.) showed a marginal reduction in total coronary heart disease, but their overall mortality from all causes was higher. Similar results have been obtained in several other studies. The few studies that indicate a correlation between fat reduction and a decrease in coronary heart disease mortality also document a concurrent increase in deaths from cancer, brain hemorrhage, suicide and violent death.6

The Lipid Research Clinics Coronary Primary Prevention Trial (LRC-CPPT), which cost 150 million dollars, is the study most often cited by the experts to justify lowfat diets. Actually, dietary cholesterol and saturated fat were not tested in this study as all subjects were given a low-cholesterol, low-saturated-fat diet. Instead, the study tested the effects of a cholesterol-lowering drug. Their statistical analysis of the results implied a 24% reduction in the rate of coronary heart disease in the group taking the drug compared with the placebo group; however, nonheart disease deaths in the drug group increased—deaths from cancer, stroke, violence and suicide.7 Even the conclusion that lowering cholesterol reduces heart disease is suspect. Independent researchers who tabulated the results of this study found no significant statistical difference in coronary

heart disease death rates between the two groups.8 However, both the popular press and medical journals touted the LRC-CPPT as the long-sought proof that animal fats are the cause of heart disease, America's number one killer.

Studies that challenge the Lipid Hypothesis

While it is true that researchers have induced heart disease in some animals by giving them extremely large dosages of oxidized or rancid cholesterol—amounts ten times that found in the ordinary human diet—several population studies squarely contradict the cholesterol-heart disease connection. A survey of 1700 patients with hardening of the arteries, conducted by the famous heart surgeon Michael DeBakey, found no relationship between the level of cholesterol in the blood and the incidence of atherosclerosis.9 A survey of South Carolina adults found no correlation of blood cholesterol levels with "bad" dietary habits, such as use of red meat, animal fats, fried foods, butter, eggs, whole milk, bacon, sausage and cheese.10 A Medical Research Council survey showed that men eating butter ran half the risk of developing heart disease as those using margarine.11

Mother's milk provides a higher proportion of cholesterol than almost any other food. It also contains over 50% of its calories as fat, much of it saturated fat. Both cholesterol and saturated fat are essential for growth in babies and children, especially the development of the brain.12 Yet, the American Heart Association is now recommending a low-cholesterol, lowfat diet for children! Commercial formulas are low in saturated fats and soy formulas are devoid of cholesterol. A recent study linked lowfat diets with failure to thrive in children.13

Numerous surveys of traditional populations have yielded information that is an embarrassment to the Diet Dictocrats. For example, a study comparing Jews when they lived in Yemen, whose diets contained fats solely of animal origin, to Yemenite Jews living in Israel, whose diets contained margarine and vegetable oils, revealed little heart disease or diabetes in the former group but high levels of both diseases in the latter.14 (The study also noted that the Yemenite Jews consumed no sugar but those in Israel consumed sugar in amounts equaling 25-30% of total carbohydrate intake.) A comparison of populations in northern and southern India revealed a similar pattern. People in northern India consume 17 times more animal fat but have an incidence of coronary heart disease seven times lower than people in southern India.15 The Masai and kindred tribes of Africa subsist largely on milk, blood and beef. They are free from coronary heart disease and have excellent blood cholesterol levels.16 Eskimos eat liberally of animal fats from fish and marine animals. On their native diet they are free of disease and exceptionally hardy.17 An extensive study of diet and disease patterns in China found that the region in which the populace consumes large amounts of whole milk had half the rate of heart disease as several districts in which only small amounts of animal products are consumed.18 Several Mediterranean societies have low rates of heart disease even though fat—including highly saturated fat from lamb, sausage and goat cheese—comprises up to 70% of their caloric intake. The inhabitants of Crete, for

example, are remarkable for their good health and longevity.19 A study of Puerto Ricans revealed that, although they consume large amounts of animal fat, they have a very low incidence of colon and breast cancer.20 A study of the long-lived inhabitants of Soviet Georgia revealed that those who eat the most fatty meat live the longest.21 In Okinawa, where the average life span for women is 84 years—longer than in Japan—the inhabitants eat generous amounts of pork and seafood and do all their cooking in lard.22 None of these studies is mentioned by those urging restriction of saturated fats.

The relative good health of the Japanese, who have the longest life span of any nation in the world, is generally attributed to a lowfat diet. Although the Japanese eat few dairy fats, the notion that their diet is low in fat is a myth; rather, it contains moderate amounts of animal fats from eggs, pork, chicken, beef, seafood and organ meats. With their fondness for shellfish and fish broth, eaten on a daily basis, the Japanese probably consume more cholesterol than most Americans. What they do not consume is a lot of vegetable oil, white flour or processed food (although they do eat white rice.) The life span of the Japanese has increased since World War II with an increase in animal fat and protein in the diet.23 Those who point to Japanese statistics to promote the lowfat diet fail to mention that the Swiss live almost as long on one of the fattiest diets in the world. Tied for third in the longevity stakes are Austria and Greece—both with high-fat diets.24

As a final example, let us consider the French. Anyone who has eaten his way across France has observed that the French diet is just loaded with saturated fats in the form of butter, eggs, cheese, cream, liver, meats and rich patés. Yet the French have a lower rate of coronary heart disease than many other western countries. In the United States, 315 of every 100,000 middle-aged men die of heart attacks each year; in France the rate is 145 per 100,000. In the Gascony region, where goose and duck liver form a staple of the diet, this rate is a remarkably low 80 per 100,000.25 This phenomenon has recently gained international attention as the French Paradox. (The French do suffer from many degenerative diseases, however. They eat large amounts of sugar and white flour and in recent years have succumbed to the timesaving temptations of processed foods.)

A chorus of establishment voices, including the American Cancer Society, the National Cancer Institute and the Senate Committee on Nutrition and Human Needs, claims that animal fat is linked not only with heart disease but also with cancers of various types. Yet when researchers from the University of Maryland analyzed the data they used to make such claims, they found that vegetable fat consumption was correlated with cancer and animal fat was not.26

Understanding the chemistry of fats

Clearly something is wrong with the theories we read in the popular press—and used to bolster sales of lowfat concoctions and cholesterol-free foods. The notion that saturated fats per se cause heart disease as well as cancer is not only facile, it is just plain wrong.

But it is true that some fats are bad for us. In order to understand which ones, we must know something about the chemistry of fats.

Fats—or lipids—are a class of organic substances that are not soluble in water. In simple terms, fatty acids are chains of carbon atoms with hydrogen atoms filling the available bonds. Most fat in our bodies and in the food we eat is in the form of triglycerides, that is, three fatty-acid chains attached to a glycerol molecule. Elevated triglycerides in the blood have been positively linked to proneness to heart disease, but these triglycerides do not come directly from dietary fats; they are made in the liver from any excess sugars that have not been used for energy. The source of these excess sugars is any food containing carbohydrates, particularly refined sugar and white flour.
Fatty acid classifications by saturation

Fatty acids are classified in the following way:

Saturated: A fatty acid is saturated when all available carbon bonds are occupied by a hydrogen atom. They are highly stable, because all the carbon-atom linkages are filled—or saturated—with hydrogen. This means that they do not normally go rancid, even when heated for cooking purposes. They are straight in form and hence pack together easily, so that they form a solid or semisolid fat at room temperature. Your body makes saturated fatty acids from carbohydrates and they are found in animal fats and tropical oils.

Monounsaturated: Monounsaturated fatty acids have one double bond in the form of two carbon atoms double-bonded to each other and, therefore, lack two hydrogen atoms. Your body makes monounsaturated fatty acids from saturated fatty acids and uses them in a number of ways. Monounsaturated fats have a kink or bend at the position of the double bond so that they do not pack together as easily as saturated fats and, therefore, tend to be liquid at room temperature. Like saturated fats, they are relatively stable. They do not go rancid easily and hence can be used in cooking. The monounsaturated fatty acid most commonly found in our food is oleic acid, the main component of olive oil as well as the oils from almonds, pecans, cashews, peanuts and avocados.

Polyunsaturated: Polyunsaturated fatty acids have two or more pairs of double bonds and, therefore, lack four or more hydrogen atoms. The two polyunsaturated fatty acids found most frequently in our foods are double unsaturated linoleic acid, with two double bonds—also called omega-6; and triple unsaturated linolenic acid, with three double bonds—also called omega-3. (The omega number indicates the position of the first double bond.) Your body cannot make these fatty acids and hence they are called "essential." We must obtain our essential fatty acids or EFA's from the foods we eat. The polyunsaturated fatty acids have kinks or turns at the position of the double bond and hence do not pack together easily. They are liquid, even when refrigerated. The unpaired electrons at the double bonds makes these oils highly reactive. They go rancid

easily, particularly omega-3 linolenic acid, and must be treated with care. Polyunsaturated oils should never be heated or used in cooking. In nature, the polyunsaturated fatty acids are usually found in the cis form, which means that both hydrogen atoms at the double bond are on the same side.

All fats and oils, whether of vegetable or animal origin, are some combination of saturated fatty acids, monounsaturated fatty acids and polyunsaturated linoleic acid and linolenic acid. In general, animal fats such as butter, lard and tallow contain about 40-60% saturated fat and are solid at room temperature. Vegetable oils from northern climates contain a preponderance of polyunsaturated fatty acids and are liquid at room temperature. But vegetable oils from the tropics are highly saturated. Coconut oil, for example, is 92% saturated. These fats are liquid in the tropics but hard as butter in northern climes. Vegetable oils are more saturated in hot climates because the increased saturation helps maintain stiffness in plant leaves. Olive oil with its preponderance of oleic acid is the product of a temperate climate. It is liquid at warm temperatures but hardens when refrigerated.
Classification of fatty acids by length

Researchers classify fatty acids not only according to their degree of saturation but also by their length.

Short-chain fatty acids have four to six carbon atoms. These fats are always saturated. Four-carbon butyric acid is found mostly in butterfat from cows, and six-carbon capric acid is found mostly in butterfat from goats. These fatty acids have antimicrobial properties—that is, they protect us from viruses, yeasts and pathogenic bacteria in the gut. They do not need to be acted on by the bile salts but are directly absorbed for quick energy. For this reason, they are less likely to cause weight gain than olive oil or commercial vegetable oils.27 Short-chain fatty acids also contribute to the health of the immune system.28

Medium-chain fatty acids have eight to twelve carbon atoms and are found mostly in butterfat and the tropical oils. Like the short-chain fatty acids, these fats have antimicrobial properties; are absorbed directly for quick energy; and contribute to the health of the immune system.

Long-chain fatty acids have from 14 to 18 carbon atoms and can be either saturated, monounsaturated or polyunsaturated. Stearic acid is an 18-carbon saturated fatty acid found chiefly in beef and mutton tallows. Oleic acid is an 18-carbon monounsaturated fat which is the chief component of olive oil. Another monounsaturated fatty acid is the 16-carbon palmitoleic acid which has strong antimicrobial properties. It is found almost exclusively in animal fats. The two essential fatty acids are also long chain, each 18 carbons in length. Another important long-chain fatty acid is gamma-linolenic acid (GLA) which has 18 carbons and three double bonds. It is found in evening primrose, borage and black currant oils. Your body makes GLA out of omega-6 linoleic acid and

uses it in the production of substances called prostaglandins, localized tissue hormones that regulate many processes at the cellular level.

Very-long-chain fatty acids have 20 to 24 carbon atoms. They tend to be highly unsaturated, with four, five or six double bonds. Some people can make these fatty acids from EFA's, but others, particularly those whose ancestors ate a lot of fish, lack enzymes to produce them. These "obligate carnivores" must obtain them from animal foods such as organ meats, egg yolks, butter and fish oils. The most important very-long-chain fatty acids are dihomo-gamma-linolenic acid (DGLA) with 20 carbons and three double bonds; arachidonic acid (AA) with 20 carbons and four double bonds; eicosapentaenoic acid (EPA) with 20 carbons and five double bonds; and docosahexaenoic acid (DHA) with 22 carbons and six double bonds. All of these except DHA are used in the production of prostaglandins, localized tissue hormones that direct many processes in the cells. In addition, AA and DHA play important roles in the function of the nervous system.29
The dangers of polyunsaturates

The public has been fed a great deal of misinformation about the relative virtues of saturated fats versus polyunsaturated oils. Politically correct dietary gurus tell us that the polyunsaturated oils are good for us and that the saturated fats cause cancer and heart disease. The result is that fundamental changes have occurred in the Western diet. At the turn of the century, most of the fatty acids in the diet were either saturated or monounsaturated, primarily from butter, lard, tallows, coconut oil and small amounts of olive oil. Today most of the fats in the diet are polyunsaturated from vegetable oils derived mostly from soy, as well as from corn, safflower and canola.

Modern diets can contain as much as 30% of calories as polyunsaturated oils, but scientific research indicates that this amount is far too high. The best evidence indicates that our intake of polyunsaturates should not be much greater than 4% of the caloric total, in approximate proportions of 1 1/2 % omega-3 linolenic acid and 2 1/2 % omega-6 linoleic acid.30 EFA consumption in this range is found in native populations in temperate and tropical regions whose intake of polyunsaturated oils comes from the small amounts found in legumes, grains, nuts, green vegetables, fish, olive oil and animal fats but not from commercial vegetable oils.

Excess consumption of polyunsaturated oils has been shown to contribute to a large number of disease conditions including increased cancer and heart disease; immune system dysfunction; damage to the liver, reproductive organs and lungs; digestive disorders; depressed learning ability; impaired growth; and weight gain.31

One reason the polyunsaturates cause so many health problems is that they tend to become oxidized or rancid when subjected to heat, oxygen and moisture as in cooking and processing. Rancid oils are characterized by free radicals—that is, single atoms or clusters with an unpaired electron in an outer orbit. These compounds are extremely

reactive chemically. They have been characterized as "marauders" in the body for they attack cell membranes and red blood cells and cause damage in DNA/RNA strands, thus triggering mutations in tissue, blood vessels and skin. Free radical damage to the skin causes wrinkles and premature aging; free radical damage to the tissues and organs sets the stage for tumors; free radical damage in the blood vessels initiates the buildup of plaque. Is it any wonder that tests and studies have repeatedly shown a high correlation between cancer and heart disease with the consumption of polyunsaturates? 32 New evidence links exposure to free radicals with premature aging, with autoimmune diseases such as arthritis and with Parkinson's disease, Lou Gehrig's disease, Alzheimer's and cataracts.33

Too much Omega-6

Problems associated with an excess of polyunsaturates are exacerbated by the fact that most polyunsaturates in commercial vegetable oils are in the form of double unsaturated omega-6 linoleic acid, with very little of vital triple unsaturated omega-3 linolenic acid. Recent research has revealed that too much omega-6 in the diet creates an imbalance that can interfere with production of important prostaglandins.34 This disruption can result in increased tendency to form blood clots, inflammation, high blood pressure, irritation of the digestive tract, depressed immune function, sterility, cell proliferation, cancer and weight gain.35

Too little Omega-3

A number of researchers have argued that along with a surfeit of omega-6 fatty acids the American diet is deficient in the more unsaturated omega-3 linolenic acid. This fatty acid is necessary for cell oxidation, for metabolizing important sulphur-containing amino acids and for maintaining proper balance in prostaglandin production. Deficiencies have been associated with asthma, heart disease and learning deficiencies.36 Most commercial vegetable oils contain very little omega-3 linolenic acid and large amounts of the omega-6 linoleic acid. In addition, modern agricultural and industrial practices have reduced the amount of omega-3 fatty acids in commercially available vegetables, eggs, fish and meat. For example, organic eggs from hens allowed to feed on insects and green plants can contain omega-6 and omega-3 fatty acids in the beneficial ratio of approximately one-to-one; but commercial supermarket eggs can contain as much as nineteen times more omega-6 than omega-3!37

The benefits of saturated fats

The much-maligned saturated fats—which Americans are trying to avoid—are not the cause of our modern diseases. In fact, they play many important roles in the body chemistry:

Saturated fatty acids constitute at least 50% of the cell membranes. They are what gives our cells necessary stiffness and integrity.

They play a vital role in the health of our bones. For calcium to be effectively

incorporated into the skeletal structure, at least 50% of the dietary fats should be saturated.38

They lower Lp(a), a substance in the blood that indicates proneness to heart disease.39
They protect the liver from alcohol and other toxins, such as Tylenol.40

They enhance the immune system.41

They are needed for the proper utilization of essential fatty acids.
Elongated omega-3 fatty acids are better retained in the tissues when the diet is rich in saturated fats. 42

Saturated 18-carbon stearic acid and 16-carbon palmitic acid are the preferred foods for the heart, which is why the fat around the heart muscle is highly saturated.43 The heart draws on this reserve of fat in times of stress.

Short- and medium-chain saturated fatty acids have important antimicrobial properties. They protect us against harmful microorganisms in the digestive tract.

The scientific evidence, honestly evaluated, does not support the assertion that "artery-clogging" saturated fats cause heart disease.44 Actually, evaluation of the fat in artery clogs reveals that only about 26% is saturated. The rest is unsaturated, of which more than half is polyunsaturated.45
What about Cholesterol?

And what about cholesterol? Here, too, the public has been misinformed. Our blood vessels can become damaged in a number of ways—through irritations caused by free radicals or viruses, or because they are structurally weak—and when this happens, the body's natural healing substance steps in to repair the damage. That substance is cholesterol. Cholesterol is a high-molecular-weight alcohol that is manufactured in the liver and in most human cells. Like saturated fats, the cholesterol we make and consume plays many vital roles:
Along with saturated fats, cholesterol in the cell membrane gives our cells necessary stiffness and stability. When the diet contains an excess of polyunsaturated fatty acids, these replace saturated fatty acids in the cell membrane, so that the cell walls actually become flabby. When this happens, cholesterol from the blood is "driven" into the tissues to give them structural integrity. This is why serum cholesterol levels may go down temporarily when we replace saturated fats with polyunsaturated oils in the diet.46

Cholesterol acts as a precursor to vital corticosteroids, hormones that help us deal with stress and protect the body against heart disease and cancer; and to the sex hormones like androgen, testosterone, estrogen and progesterone.

Cholesterol is a precursor to vitamin D, a very important fat-soluble vitamin needed for healthy bones and nervous system, proper growth, mineral metabolism, muscle tone, insulin production, reproduction and immune system function.

The bile salts are made from cholesterol. Bile is vital for digestion and assimilation of fats in the diet.

Recent research shows that cholesterol acts as an antioxidant.47 This is the likely explanation for the fact that cholesterol levels go up with age. As an antioxidant, cholesterol protects us against free radical damage that leads to heart disease and cancer.

Cholesterol is needed for proper function of serotonin receptors in the brain.48 Serotonin is the body's natural "feel-good" chemical. Low cholesterol levels have been linked to aggressive and violent behavior, depression and suicidal tendencies.

Mother's milk is especially rich in cholesterol and contains a special enzyme that helps the baby utilize this nutrient. Babies and children need cholesterol-rich foods throughout their growing years to ensure proper development of the brain and nervous system.

Dietary cholesterol plays an important role in maintaining the health of the intestinal wall.49 This is why low-cholesterol vegetarian diets can lead to leaky gut syndrome and other intestinal disorders.

Cholesterol is not the cause of heart disease but rather a potent antioxidant weapon against free radicals in the blood, and a repair substance that helps heal arterial damage (although the arterial plaques themselves contain very little cholesterol.) However, like fats, cholesterol may be damaged by exposure to heat and oxygen. This damaged or oxidized cholesterol seems to promote both injury to the arterial cells as well as a pathological buildup of plaque in the arteries.50 Damaged cholesterol is found in powdered eggs, in powdered milk (added to reduced-fat milks to give them body) and in meats and fats that have been heated to high temperatures in frying and other high-temperature processes.

High serum cholesterol levels often indicate that the body needs cholesterol to protect

itself from high levels of altered, free-radical-containing fats. Just as a large police force is needed in a locality where crime occurs frequently, so cholesterol is needed in a poorly nourished body to protect the individual from a tendency to heart disease and cancer. Blaming coronary heart disease on cholesterol is like blaming the police for murder and theft in a high crime area.

Poor thyroid function (hypothyroidism) will often result in high cholesterol levels. When thyroid function is poor, usually due to a diet high in sugar and low in usable iodine, fat-soluble vitamins and other nutrients, the body floods the blood with cholesterol as an adaptive and protective mechanism, providing a superabundance of materials needed to heal tissues and produce protective steroids. Hypothyroid individuals are particularly susceptible to infections, heart disease and cancer.51

The cause and treatment of heart disease

The cause of heart disease is not animal fats and cholesterol but rather a number of factors inherent in modern diets, including excess consumption of vegetables oils and hydrogenated fats; excess consumption of refined carbohydrates in the form of sugar and white flour; mineral deficiencies, particularly low levels of protective magnesium and iodine; deficiencies of vitamins, particularly of vitamin C, needed for the integrity of the blood vessel walls, and of antioxidants like selenium and vitamin E, which protect us from free radicals; and, finally, the disappearance of antimicrobial fats from the food supply, namely, animal fats and tropical oils.52 These once protected us against the kinds of viruses and bacteria that have been associated with the onset of pathogenic plaque leading to heart disease.

While serum cholesterol levels provide an inaccurate indication of future heart disease, a high level of a substance called homocysteine in the blood has been positively correlated with pathological buildup of plaque in the arteries and the tendency to form clots—a deadly combination. Folic acid, vitamin B6, vitamin B12 and choline are nutrients that lower serum homocysteine levels.53 These nutrients are found mostly in animal foods.

The best way to treat heart disease, then, is not to focus on lowering cholesterol—either by drugs or diet—but to consume a diet that provides animal foods rich in vitamins B6 and B12; to bolster thyroid function by daily use of natural sea salt, a good source of usable iodine; to avoid vitamin and mineral deficiencies that make the artery walls more prone to ruptures and the buildup of plaque; to include the antimicrobial fats in the diet; and to eliminate processed foods containing refined carbohydrates, oxidized cholesterol and free-radical-containing vegetable oils that cause the body to need constant repair.

Modern methods of processing fats

It is important to understand that, of all substances ingested by the body, it is polyunsaturated oils that are most easily rendered dangerous by food processing, especially unstable omega-3 linolenic acid. Consider the following processes inflicted

upon naturally occurring fatty acids before they appear on our tables:

Extraction: Oils naturally occurring in fruits, nuts and seeds must first be extracted. In the old days this extraction was achieved by slow-moving stone presses. But oils processed in large factories are obtained by crushing the oil-bearing seeds and heating them to 230 degrees. The oil is then squeezed out at pressures from 10 to 20 tons per inch, thereby generating more heat. During this process the oils are exposed to damaging light and oxygen. In order to extract the last 10% or so of the oil from crushed seeds, processors treat the pulp with one of a number of solvents—usually hexane. The solvent is then boiled off, although up to 100 parts per million may remain in the oil. Such solvents, themselves toxic, also retain the toxic pesticides adhering to seeds and grains before processing begins.

High-temperature processing causes the weak carbon bonds of unsaturated fatty acids, especially triple unsaturated linolenic acid, to break apart, thereby creating dangerous free radicals. In addition, antioxidants, such as fat-soluble vitamin E, which protect the body from the ravages of free radicals, are neutralized or destroyed by high temperatures and pressures. BHT and BHA, both suspected of causing cancer and brain damage, are often added to these oils to replace vitamin E and other natural preservatives destroyed by heat.

There is a safe modern technique for extraction that drills into the seeds and extracts the oil and its precious cargo of antioxidants under low temperatures, with minimal exposure to light and oxygen. These expeller-expressed, unrefined oils will remain fresh for a long time if stored in the refrigerator in dark bottles. Extra virgin olive oil is produced by crushing olives between stone or steel rollers. This process is a gentle one that preserves the integrity of the fatty acids and the numerous natural preservatives in olive oil. If olive oil is packaged in opaque containers, it will retain its freshness and precious store of antioxidants for many years.

TheUnhivedMind - April 12, 2011 09:54 PM (GMT)

Hydrogenation: This is the process that turns polyunsaturates, normally liquid at room temperature, into fats that are solid at room temperature—margarine and shortening. To produce them, manufacturers begin with the cheapest oils—soy, corn, cottonseed or canola, already rancid from the extraction process—and mix them with tiny metal particles—usually nickel oxide. The oil with its nickel catalyst is then subjected to hydrogen gas in a high-pressure, high-temperature reactor. Next, soap-like emulsifiers and starch are squeezed into the mixture to give it a better consistency; the oil is yet again subjected to high temperatures when it is steam-cleaned. This removes its unpleasant odor. Margarine's natural color, an unappetizing grey, is removed by bleach. Dyes and strong flavors must then be added to make it resemble butter. Finally, the mixture is compressed and packaged in blocks or tubs and sold as a health food.

Partially hydrogenated margarines and shortenings are even worse for you than the highly refined vegetable oils from which they are made because of chemical changes that occur during the hydrogenation process. Under high temperatures, the nickel catalyst causes the hydrogen atoms to change position on the fatty acid chain. Before hydrogenation, pairs of hydrogen atoms occur together on the chain, causing the chain to bend slightly and creating a concentration of electrons at the site of the double bond. This is called the cis formation, the configuration most commonly found in nature. With hydrogenation, one hydrogen atom of the pair is moved to the other side so that the molecule straightens. This is called the trans formation, rarely found in nature. Most of these man-made trans fats are toxins to the body, but unfortunately your digestive system does not recognize them as such. Instead of being eliminated, trans fats are incorporated into cell membranes as if they were cis fats—your cells actually become partially hydrogenated! Once in place, trans fatty acids with their misplaced hydrogen atoms wreak havoc in cell metabolism because chemical reactions can only take place when electrons in the cell membranes are in certain arrangements or patterns, which the hydrogenation process has disturbed.

In the 1940's, researchers found a strong correlation between cancer and the consumption of fat—the fats used were hydrogenated fats although the results were presented as though the culprit were saturated fats.54 In fact, until recently saturated fats were usually lumped together with trans fats in the various U.S. data bases that researchers use to correlate dietary trends with disease conditions.55 Thus, natural saturated fats were tarred with the black brush of unnatural hydrogenated vegetable oils.

Altered partially hydrogenated fats made from vegetable oils actually block utilization of essential fatty acids, causing many deleterious effects including sexual dysfunction, increased blood cholesterol and paralysis of the immune system.56 Consumption of hydrogenated fats is associated with a host of other serious diseases, not only cancer but also atherosclerosis, diabetes, obesity, immune system dysfunction, low-birth-weight babies, birth defects, decreased visual acuity, sterility, difficulty in lactation and problems with bones and tendons.57 Yet hydrogenated fats continue to be promoted as health foods. The popularity of partially hydrogenated margarine over butter represents a triumph of advertising duplicity over common sense. Your best defense is to avoid it like the plague.

Homogenization: This is the process whereby the fat particles of cream are strained through tiny pores under great pressure. The resulting fat particles are so small that they stay in suspension rather than rise to the top of the milk. This makes the fat and cholesterol more susceptible to rancidity and oxidation, and some research indicates that homogenized fats may contribute to heart disease.58

The media's constant attack on saturated fats is extremely suspect. Claims that butter

causes chronic high cholesterol values have not been substantiated by research—although some studies show that butter consumption causes a small, temporary rise—while other studies have shown that stearic acid, the main component of beef fat, actually lowers cholesterol.59 Margarine, on the other hand, provokes chronic high levels of cholesterol and has been linked to both heart disease and cancer.60 The new soft margarines or tub spreads, while lower in hydrogenated fats, are still produced from rancid vegetable oils and contain many additives.

The Diet Dictocrats have succeeded in convincing Americans that butter is dangerous, when in fact it is a valued component of many traditional diets and a source of the following nutrients:
Nutrition of fats

Fat-Soluble Vitamins: These include true vitamin A or retinol, vitamin D, vitamin K and vitamin E as well as all their naturally occurring cofactors needed to obtain maximum effect. Butter is America's best source of these important nutrients. In fact, vitamin A is more easily absorbed and utilized from butter than from other sources.61 Fortunately, these fat-soluble vitamins are relatively stable and survive the pasteurization process.

When Dr. Weston Price studied isolated traditional peoples around the world, he found that butter was a staple in many native diets. (He did not find any isolated peoples who consumed polyunsaturated oils.) The groups he studied particularly valued the deep yellow butter produced by cows feeding on rapidly growing green grass. Their natural intuition told them that its life-giving qualities were especially beneficial for children and expectant mothers. When Dr. Price analyzed this deep yellow butter he found that it was exceptionally high in all fat-soluble vitamins, particularly vitamin A. He called these vitamins "catalysts" or "activators." Without them, according to Dr. Price, we are not able to utilize the minerals we ingest, no matter how abundant they may be in our diets. He also believed the fat-soluble vitamins to be necessary for absorption of the water-soluble vitamins. Vitamins A and D are essential for growth, for healthy bones, for proper development of the brain and nervous systems and for normal sexual development. Many studies have shown the importance of butterfat for reproduction; its absence results in "nutritional castration," the failure to bring out male and female sexual characteristics. As butter consumption in America has declined, sterility rates and problems with sexual development have increased. In calves, butter substitutes are unable to promote growth or sustain reproduction.62

Not all the societies Dr. Price studied ate butter; but all the groups he observed went to great lengths to obtain foods high in fat-soluble vitamins—fish, shellfish, fish eggs, organ meats, blubber of sea animals and insects. Without knowing the names of the vitamins contained in these foods, isolated traditional societies recognized their importance in the diet and liberally ate the animal products containing them. They rightly believed such foods to be necessary for fertility and the optimum development of children. Dr. Price analyzed the nutrient content of native diets and found that they

consistently provided about ten times more fat soluble vitamins than the American diet of the 1930's. This ratio is probably more extreme today as Americans have deliberately reduced animal fat consumption. Dr. Price realized that these fat-soluble vitamins promoted the beautiful bone structure, wide palate, flawless uncrowded teeth and handsome, well-proportioned faces that characterized members of isolated traditional groups. American children in general do not eat fish or organ meats, at least not to any great extent, and blubber and insects are not a part of the western diet; many will not eat eggs. The only good source of fat-soluble vitamins in the American diet, one sure to be eaten, is butterfat. Butter added to vegetables and spread on bread, and cream added to soups and sauces, ensure proper assimilation of the minerals and water-soluble vitamins in vegetables, grains and meat.

The Wulzen Factor: Called the "antistiffness" factor, this compound is present in raw animal fat. Researcher Rosalind Wulzen discovered that this substance protects humans and animals from calcification of the joints—degenerative arthritis. It also protects against hardening of the arteries, cataracts and calcification of the pineal gland.63 Calves fed pasteurized milk or skim milk develop joint stiffness and do not thrive. Their symptoms are reversed when raw butterfat is added to the diet. Pasteurization destroys the Wulzen factor—it is present only in raw butter, cream and whole milk.

The Price Factor or Activator X: Discovered by Dr. Price, Activator X is a powerful catalyst which, like vitamins A and D, helps the body absorb and utilize minerals. It is found in organ meats from grazing animals and some sea food. Butter can be an especially rich source of Activator X when it comes from cows eating rapidly growing grass in the spring and fall seasons. It disappears in cows fed cottonseed meal or high protein soy-based feeds.64 Fortunately, Activator X is not destroyed by pasteurization.

Arachidonic Acid: A 20-carbon polyunsaturate containing four double bonds, found in small amounts only in animal fats. Arachidonic acid (AA) plays a role in the function of the brain, is a vital component of the cell membranes and is a precursor to important prostaglandins. Some dietary gurus warn against eating foods rich in AA, claiming that it contributes to the production of "bad" prostaglandins, ones that cause inflammation. But prostaglandins that counteract inflammation are also made from AA.

Short- and Medium-Chain Fatty Acids: Butter contains about 12-15% short- and medium-chain fatty acids. This type of saturated fat does not need to be emulsified by bile salts but is absorbed directly from the small intestine to the liver, where it is converted into quick energy. These fatty acids also have antimicrobial, antitumor and immune-system-supporting properties, especially 12-carbon lauric acid, a medium-chain fatty acid not found in other animal fats. Highly protective lauric acid should be called a conditionally essential fatty acid because it is made only by the mammary gland and not in the liver like other saturated fats.65 We must obtain it from one of two dietary sources—small amounts in butterfat or large amounts in coconut oil. Four-

carbon butyric acid is all but unique to butter. It has antifungal properties as well as antitumor effects.66

Omega-6 and Omega-3 Essential Fatty Acids: These occur in butter in small but nearly equal amounts. This excellent balance between linoleic and linolenic acid prevents the kind of problems associated with overconsumption of omega-6 fatty acids.

Conjugated Linoleic Acid: Butter from pasture-fed cows also contains a form of rearranged linoleic acid called CLA, which has strong anticancer properties. It also encourages the buildup of muscle and prevents weight gain. CLA disappears when cows are fed dry hay or processed feed.67

Lecithin: Lecithin is a natural component of butter that assists in the proper assimilation and metabolization of cholesterol and other fat constituents.

Cholesterol: Mother's milk is high in cholesterol because it is essential for growth and development. Cholesterol is also needed to produce a variety of steroids that protect against cancer, heart disease and mental illness.

Glycosphingolipids: This type of fat protects against gastrointestinal infections, especially in the very young and the elderly. For this reason, children who drink skimmed milk have diarrhea at rates three to five times greater than children who drink whole milk.68

Trace Minerals: Many trace minerals are incorporated into the fat globule membrane of butterfat, including manganese, zinc, chromium and iodine. In mountainous areas far from the sea, iodine in butter protects against goiter. Butter is extremely rich in selenium, a trace mineral with antioxidant properties, containing more per gram than herring or wheat germ.

One frequently voiced objection to the consumption of butter and other animal fats is that they tend to accumulate environmental poisons. Fat-soluble poisons such as DDT do accumulate in fats; but water-soluble poisons, such as antibiotics and growth hormones, accumulate in the water fraction of milk and meats. Vegetables and grains also accumulate poisons. The average plant crop receives ten applications of pesticides—from planting to storage—while cows generally graze on pasture that is unsprayed. Aflatoxin, a fungus that grows on grain, is one of the most powerful carcinogens known. It is correct to assume that all of our foods, whether of vegetable or animal origin, may be contaminated. The solution to environmental poisons is not to eliminate animal fats—so essential to growth, reproduction and overall health—but to seek out organic meats and butter from pasture-fed cows, as well as organic vegetables and grains. These are becoming increasingly available in health food stores and supermarkets and through mail order and cooperatives.
Composition of different fats

Before leaving this complex but vital subject of fats, it is worthwhile examining the composition of vegetable oils and other animal fats in order to determine their usefulness and appropriateness in food preparation:

Duck and Goose Fat are semisolid at room temperature, containing about 35% saturated fat, 52% monounsaturated fat (including small amounts of antimicrobial palmitoleic acid) and about 13% polyunsaturated fat. The proportion of omega-6 to omega-3 fatty acids depends on what the birds have eaten. Duck and goose fat are quite stable and are highly prized in Europe for frying potatoes.

Chicken Fat is about 31% saturated, 49% monounsaturated (including moderate amounts of antimicrobial palmitoleic acid) and 20% polyunsaturated, most of which is omega-6 linoleic acid, although the amount of omega-3 can be raised by feeding chickens flax or fish meal, or allowing them to range free and eat insects. Although widely used for frying in kosher kitchens, it is inferior to duck and goose fat, which were traditionally preferred to chicken fat in Jewish cooking.

Lard or pork fat is about 40% saturated, 48% monounsaturated (including small amounts of antimicrobial palmitoleic acid) and 12% polyunsaturated. Like the fat of birds, the amount of omega-6 and omega-3 fatty acids will vary in lard according to what has been fed to the pigs. In the tropics, lard may also be a source of lauric acid if the pigs have eaten coconuts. Like duck and goose fat, lard is stable and a preferred fat for frying. It was widely used in America at the turn of the century. It is a good source of vitamin D, especially in third-world countries where other animal foods are likely to be expensive. Some researchers believe that pork products should be avoided because they may contribute to cancer. Others suggest that only pork meat presents a problem and that pig fat in the form of lard is safe and healthy.

Beef and Mutton Tallows are 50-55% saturated, about 40% monounsaturated and contain small amounts of the polyunsaturates, usually less than 3%. Suet, which is the fat from the cavity of the animal, is 70-80% saturated. Suet and tallow are very stable fats and can be used for frying. Traditional cultures valued these fats for their health benefits. They are a good source of antimicrobial palmitoleic acid.

Olive Oil contains 75% oleic acid, the stable monounsaturated fat, along with 13% saturated fat, 10% omega-6 linoleic acid and 2% omega-3 linolenic acid. The high percentage of oleic acid makes olive oil ideal for salads and for cooking at moderate temperatures. Extra virgin olive oil is also rich in antioxidants. It should be cloudy, indicating that it has not been filtered, and have a golden yellow color, indicating that it is made from fully ripened olives. Olive oil has withstood the test of time; it is the safest vegetable oil you can use, but don’t overdo. The longer chain fatty acids found in olive oil are more likely to contribute to the buildup of body fat than the short- and medium-chain fatty acids found in butter, coconut oil or palm kernel oil.

Peanut Oil contains 48% oleic acid, 18% saturated fat and 34% omega-6 linoleic acid. Like olive oil, peanut oil is relatively stable and, therefore, appropriate for stir-frys on occasion. But the high percentage of omega-6 presents a potential danger, so use of peanut oil should be strictly limited.

Sesame Oil contains 42% oleic acid, 15% saturated fat, and 43% omega-6 linoleic acid. Sesame oil is similar in composition to peanut oil. It can be used for frying because it contains unique antioxidants that are not destroyed by heat. However, the high percentage of omega-6 militates against exclusive use.

Safflower, Corn, Sunflower, Soybean and Cottonseed Oils all contain over 50% omega-6 and, except for soybean oil, only minimal amounts of omega-3. Safflower oil contains almost 80% omega-6. Researchers are just beginning to discover the dangers of excess omega-6 oils in the diet, whether rancid or not. Use of these oils should be strictly limited. They should never be consumed after they have been heated, as in cooking, frying or baking. High oleic safflower and sunflower oils, produced from hybrid plants, have a composition similar to olive oil, namely, high amounts of oleic acid and only small amounts of polyunsaturated fatty acids and, thus, are more stable than traditional varieties. However, it is difficult to find truly cold-pressed versions of these oils.

Canola Oil contains 5% saturated fat, 57% oleic acid, 23% omega-6 and 10%-15% omega-3. The newest oil on the market, canola oil was developed from the rape seed, a member of the mustard family. Rape seed is unsuited to human consumption because it contains a very-long-chain fatty acid called erucic acid, which under some circumstances is associated with fibrotic heart lesions. Canola oil was bred to contain little if any erucic acid and has drawn the attention of nutritionists because of its high oleic acid content. But there are some indications that canola oil presents dangers of its own. It has a high sulphur content and goes rancid easily. Baked goods made with canola oil develop mold very quickly. During the deodorizing process, the omega-3 fatty acids of processed canola oil are transformed into trans fatty acids, similar to those in margarine and possibly more dangerous.69 A recent study indicates that "heart healthy" canola oil actually creates a deficiency of vitamin E, a vitamin required for a healthy cardiovascular system.70 Other studies indicate that even low-erucic-acid canola oil causes heart lesions, particularly when the diet is low in saturated fat.71

Flax Seed Oil contains 9% saturated fatty acids, 18% oleic acid, 16% omega-6 and 57% omega-3. With its extremely high omega-3 content, flax seed oil provides a remedy for the omega-6/omega-3 imbalance so prevalent in America today. Not surprisingly, Scandinavian folk lore values flax seed oil as a health food. New extraction and bottling methods have minimized rancidity problems. It should always be kept refrigerated, never heated, and consumed in small amounts in salad dressings and spreads. Tropical Oils are more saturated than other vegetable oils. Palm oil is about

50% saturated, with 41% oleic acid and about 9% linoleic acid. Coconut oil is 92% saturated with over two-thirds of the saturated fat in the form of medium-chain fatty acids (often called medium-chain triglycerides). Of particular interest is lauric acid, found in large quantities in both coconut oil and in mother's milk. This fatty acid has strong antifungal and antimicrobial properties. Coconut oil protects tropical populations from bacteria and fungus so prevalent in their food supply; as third-world nations in tropical areas have switched to polyunsaturated vegetable oils, the incidence of intestinal disorders and immune deficiency diseases has increased dramatically. Because coconut oil contains lauric acid, it is often used in baby formulas. Palm kernel oil, used primarily in candy coatings, also contains high levels of lauric acid. These oils are extremely stable and can be kept at room temperature for many months without becoming rancid. Highly saturated tropical oils do not contribute to heart disease but have nourished healthy populations for millennia.72 It is a shame we do not use these oils for cooking and baking—the bad rap they have received is the result of intense lobbying by the domestic vegetable oil industry.73 Red palm oil has a strong taste that most will find disagreeable—although it is used extensively throughout Africa—but clarified palm oil, which is tasteless and white in color, was formerly used as shortening and in the production of commercial French fries, while coconut oil was used in cookies, crackers and pastries. The saturated fat scare has forced manufacturers to abandon these safe and healthy oils in favor of hydrogenated soybean, corn, canola and cottonseed oils.

In summary, our choice of fats and oils is one of extreme importance. Most people, especially infants and growing children, benefit from more fat in the diet rather than less. But the fats we eat must be chosen with care. Avoid all processed foods containing newfangled hydrogenated fats and polyunsaturated oils. Instead, use traditional vegetable oils like extra virgin olive oil and small amounts of unrefined flax seed oil. Acquaint yourself with the merits of coconut oil for baking and with animal fats for occasional frying. Eat egg yolks and other animal fats with the proteins to which they are attached. And, finally, use as much good quality butter as you like, with the happy assurance that it is a wholesome—indeed, an essential—food for you and your whole family.

Organic butter, extra virgin olive oil, and expeller-expressed flax oil in opaque containers are available in health food stores and gourmet markets.

Mary G. Enig, Ph.D. is an expert of international renown in the field of lipid biochemistry. She has headed a number of studies on the content and effects of trans fatty acids in America and Israel, and has successfully challenged government assertions that dietary animal fat causes cancer and heart disease. Recent scientific and media attention on the possible adverse health effects of trans fatty acids has brought increased attention to her work. She is a licensed nutritionist, certified by the Certification Board for Nutrition Specialists, a qualified expert witness, nutrition consultant to individuals, industry and state and federal governments, contributing

editor to a number of scientific publications, Fellow of the American College of Nutrition and President of the Maryland Nutritionists Association. She is the author of over 60 technical papers and presentations, as well as a popular lecturer. Dr. Enig is currently working on the exploratory development of an adjunct therapy for AIDS using complete medium chain saturated fatty acids from whole foods. She is the mother of three healthy children brought up on whole foods including butter, cream, eggs and meat.

Sally Fallon is the author of Nourishing Traditions: The Cookbook that Challenges Politically Correct Nutrition and the Diet Dictocrats (with Mary G. Enig, PhD), as well as of numerous articles on the subject of diet and health. She is President of the Weston A Price Foundation and founder of A Campaign for Real Milk. She is the mother of four healthy children raised on whole foods including butter, cream, eggs and meat.

Please remember folks they wish to depopulate this planet by 60%+ and you've heard how they would like a vegan population in the future. It seems that many vegans have short lives which would suit the New World Order right down to a tee as I believe they would really want a populace living to 33-36 at most in the future. Look at the populace already what we have, they're dying all over the place in their fifties like they would have in their seventies or eighties at one time. The health of the populace is in a dire situation. I believe these vegetable oils are absolutely lethal. I've started experimenting with animal products under the Chinese medical system. The other day out of interest I looked at some store bought butter and it was basically magarine with very little butter. Then of course you have the devious margarine companies packaging their poison up to fool people its butter with titles like utterly butterly.

When you sit back with common sense and study the food change for the worse its very frightening but certainly allows you to understand finally why people have so many of the common diseases of today. Margarine was killing cattle so they gave it to man, makes sense when you know the depopulation agenda doesn't it? We're more sick today than years ago

when people ate everything we're told is bad today. It doesn't make sense at all. Lets look at the Chinese and see how they have great health yet eat meats etc. Notice the great variety of foods they all use and how any negatives get buffered by positives of others. Lets use some common sense. I remember when I used to consume a lot of pure Coconut Oil my health dramatically increased from what it was. I noticed the other month that a book I bought for around £15 is now selling for ten times that price and highlights the cholesterol scam. I would like to promote to you both Rabbit and Duck, the later having many a medicinal effect on the body.

QUOTE (TheUnhivedMind @ Apr 12 2011, 10:22 PM)

Please remember folks they wish to depopulate this planet by 60%+ and you've heard how they would like a vegan population in the future. It seems that many vegans have short lives which would suit the New World Order right down to a tee as I believe they would really want a populace living to 33-36 at most in the future. Look at the populace already what we have, they're dying all over the place in their fifties like they would have in their seventies or eighties at one time. The health of the populace is in a dire situation. I believe these vegetable oils are absolutely lethal. I've started experimenting with animal products under the Chinese medical system. The other day out of interest I looked at some store bought butter and it was basically magarine with very little butter. Then of course you have the devious margarine companies packaging their poison up to fool people its butter with titles like utterly butterly.

When you sit back with common sense and study the food change for the worse its very frightening but certainly allows you to understand finally why people have so many of the common diseases of today. Margarine was killing cattle so they gave it to man, makes sense when you know the depopulation agenda doesn't it? We're more sick today than years ago when people ate everything we're told is bad today. It doesn't make sense at all. Lets look at the Chinese and see how they have great health yet eat meats etc. Notice the great variety of foods they all use and how any negatives get buffered by positives of others. Lets use some common sense. I remember when I used to consume a lot of pure Coconut Oil my health dramatically increased from what it was. I noticed the other month that a book I bought for around £15 is now selling for ten times that price and highlights the cholesterol

> **scam. I would like to promote to you both Rabbit and Duck, the later having many a medicinal effect on the body.**

And that is why potato chips are sold below cost in North America.

To load you up with cotton seed oil and rape seed oil and MSG.

It's the Beef

Written by Sally Fallon and Mary G. Enig, PhD

Read this article in: French

Myths & Truths About Beef

With the exception of butter, no other food has been subjected to such intense demonization in recent years as red meat, particularly beef. The juicy hamburger, that delicious marbled steak and the Sunday roast have been accused of terrible crimes. Beef causes heart disease, say the Diet Dictocrats. Beef causes cancer, particularly colon cancer, beef causes osteoporosis, beef causes autoimmune diseases like asthma, beef harbors E. coli leading to food-borne illness, beef causes Creutzfeldt Jakob disease.

Recently a vegetarian group called People for the Ethical Treatment of Animals placed billboard ads warning men not to eat beef because it causes impotence! Red meat is an acid-forming food, say the vegetarians, which putrefies in the gut because humans can't digest meat. Beef production destroys the environment, according to the zealots, and takes away land that could be dedicated to grain for starving millions. Let's examine these accusations one at a time.
Does beef cause heart disease?

First is the notion that beef causes heart disease. This actually dates back to the 1950's when the lipid hypothesis was taking hold on the American consciousness. At that time, scientists were grappling with a new threat to public health—a steep rise in heart disease, especially myocardial infarction (MI)—a massive blood clot leading to obstruction of a coronary artery and consequent death to the heart muscle. MI was almost nonexistent in 1910 and caused no more than three thousand deaths per year in 1930. By 1960, there were at least 500,000 MI deaths per year in the US.

Many scientists believed that the culprit was cholesterol and saturated fats found in animal foods like butter, eggs and beef. They reasoned that saturated fat and cholesterol raised the level of cholesterol in the blood which in turned caused the deposition of cholesterol as plaques in the arteries, leading to obstructions and heart disease. This, in a nutshell, is the lipid hypothesis.1

This theory was tested in 1957 when Dr. Norman Jolliffe, Director of the Nutrition Bureau of the New York Health Department, initiated the Anti-Coronary Club. With great media fanfare, a group of businessmen, ranging in age from 40 to 59 years, were placed on the so-called Prudent Diet. Prudent Dieters used corn oil and margarine instead of butter, cold breakfast cereals instead of eggs and chicken and fish instead of beef. Anti-Coronary Club members were to be compared with a "matched" group of the same age who ate eggs for breakfast and had meat three times a day. Jolliffe, an overweight diabetic confined to a wheel chair, was confident that the Prudent Diet would save lives, including his own.

The results of Dr. Jolliffe's Anti-Coronary Club experiment were published in 1966 in the Journal of the American Medical Association.2Those on the Prudent Diet of corn oil, margarine, fish, chicken and cold cereal had an average serum cholesterol of 220, compared to 250 in the meat-and-potatoes control group. However, the study authors were obliged to note that there were eight deaths from heart disease among Dr. Jolliffe's Prudent Diet group, and none among those who ate meat three times a day. Dr. Jolliffe was dead by this time. He succumbed in 1961 from a vascular thrombosis, although the obituaries listed the cause of death as complications from diabetes.

The truth is that in spite of all the propaganda you have heard, the lipid hypothesis has never been proved. In fact, inadequate protein intake leads to loss of myocardial muscle and may, therefore, contribute to coronary heart disease.3

There are many societies where the populace consumes high levels of animal food and saturated fat but remains free of heart disease. Dr. George Mann, who studied the Masai cattle herding peoples in Africa, found no heart disease, even though their diet consisted of meat, blood and rich milk. 4 Butterfat consumption among Masai warriors, who consider vegetable foods as fodder for cattle, can reach one and one half pounds per day. Yet these people do not suffer from heart disease. Mann called the lipid hypothesis "the greatest scam in the history of medicine." It is a scam that has been used to convince millions of healthy people that they are sick and must take expensive drugs with serious side effects, a falsehood that has persuaded Americans to adopt a bland, tasteless diet simply because their cholesterol has been defined as being too high.

It is true that beef consumption in the United States has gone up during the last eighty years, the period of huge increases in heart disease. Today we consume 79 pounds of beef per person per year versus 54 in 1909, a 46% increase—but poultry consumption

has increased a whopping 280%, from 18 pounds per person per year to 70. Consumption of vegetable oils, including those that have been hydrogenated, has increased 437%, from 11 pounds per person per year to 59; while consumption of butter, lard and tallow has plummeted from 30 pounds per person per year to just under 10. Whole milk consumption has declined by almost 50%, while lowfat milk consumption has doubled. Consumption of eggs, fresh fruits (excluding citrus), fresh vegetables, fresh potatoes and whole grain products has declined; but consumption of sugar and other sweeteners has almost doubled. Why, then, do today's politically correct dietary gurus continue to blame beef consumption for our ills? Is it because it is the one wholesome food that has shown an increase over the past ninety years?
What's the likely cause of heart disease?

The most likely causes of increased heart disease in America are the other changes in our diets—huge increases in consumption of refined carbohydrates and vegetable oils, particularly hydrogenated vegetable oils; and the decline in nutrient levels in our food, particularly minerals and fat soluble vitamins—vitamins found only in animal fats.

The only claim that can be made against beef as a cause of heart disease is that some studies have shown beef consumption to temporarily raise cholesterol levels in short term feeding experiments. Other studies have shown that beef consumption, including beef fat consumption, lowers cholesterol levels. But even if all studies show that beef consumption raises cholesterol levels, the only conclusion you can draw is—so what? There is no greater risk of heart disease at cholesterol levels of 300 than at 180, and people with cholesterol levels below 180 are at greater risk of death from other causes, such as cancer, intestinal diseases, accidents, violence and suicide.5 In other words, it's much more dangerous to have cholesterol levels that are too low than cholesterol levels that are too high.
Cholesterol is your best friend

The truth is that cholesterol is your best friend. It is vital for the function of the nervous system and the integrity of the digestive tract. Steroid hormones that help the body deal with stress are made from cholesterol. Sex hormones like estrogen and testosterone are made from cholesterol. Bile salts that the body uses to digest fats are made from cholesterol. Vitamin D, needed for thousands of biochemical processes, is made from cholesterol.

Cholesterol is a powerful antioxidant that protects us against cancer. It is vital to the cells because it provides waterproofing and structural integrity. And, finally, cholesterol is the body's repair substance. When our arteries are weak and develop fissures or tears, cholesterol is sequestered and used for repair. When cholesterol levels in the blood are high, it's because the body needs cholesterol. Blaming heart disease on cholesterol is like blaming a fire on the firemen who arrive to put out the flames.
Does beef cause cancer?

What about the accusation that beef causes cancer, in particular cancer of the colon? The genesis of this myth involves more than just muddied thinking, but actual skulduggery. In 1965 an influential physician, Ernst Wynder, took the data for the mostly processed vegetable oils, called them animal fat (which they were not) and compared them with worldwide colon cancer mortality.6 The table he produced showed high rates of colon cancer in European countries and low rates of colon cancer in Japan, and concluded that there was a positive effect, in other words, that saturated fat, the kind found in beef, caused colon cancer. What the data actually showed was that consumption of polyunsaturated vegetable oils, not saturated animal fats, was associated with the incidence of colon cancer. And Wynder forgot to mention that Asians have much higher rates than Americans of other types of cancers, particularly cancers of the liver, pancreas, stomach, esophagus and lungs.

Then in 1973, William Haenszel and his colleagues from the National Cancer Institute reported the findings from a study that relied on dietary recall and lacked matched controls—in other words, a very poorly designed study.7 The researchers stated that they found a relationship between beef and colon cancer that fit the earlier work of Wynder. Actually, what they really found was that among westernized Japanese Americans, those who said they consumed lots of macaroni, green beans and peas, as well as beef, had the highest rates of colon cancer; while among traditional Japanese Americans, those who said they consumed lots of dried cuttlefish, Chinese peas, bamboo shoots, rice and fermented soy products had the highest rates of colon cancer. Thus, the researchers singled out beef as the culprit from a choice of several foods associated with cancer in Westerners and ignored politically correct foods like soy products, fish and vegetables as a potential cause of cancer in Japanese Americans. Instead, this second-rate and inconclusive study has become firmly fixed in the consciousness of the scientific community as providing evidence for the assertion that beef causes colon cancer.

Two American studies conducted in the 1990's have found a higher risk of colon cancer among those who eat red meat.8 However, no study done in Europe has ever shown an association between meat consumption and cancer.9 This suggests that European sausage and luncheon meat, included in the rubric of "meat consumption," are prepared by traditional methods that require few additives, while the similar products in the United States contain many carcinogenic preservatives and flavorings. Unfortunately, the American Cancer Society's 1996 recommendation that Americans cut down on their consumption of meat—particularly fatty meat—in order to avoid cancer makes no distinction between fresh meats and those that have been embalmed with modern chemicals.

While two US studies have implicated meat consumption as a cause of colon cancer, there are several that contradict these findings. In 1975, Rowland Philips compared Seventh-Day Adventists physicians, who do not eat meat, with non-Seventh Day Adventist physicians, and found that the vegetarian doctors had higher rates of

gastrointestinal and colon-rectal cancer deaths.10 National Cancer Institute data show that Argentina, with very high levels of beef consumption, has significantly lower rates of colon cancer than other western countries where beef consumption is considerably lower.11 A 1997 study published in the International Journal of Cancer found that increased risk of colon and rectal cancer was positively associated with consumption of bread, cereal dishes, potatoes, cakes, desserts and refined sugars, but not with eggs or meat.12 And a 1978 study published in the Journal of the National Cancer Institute found no greater risk of colon cancer, regardless of the amounts of beef or other meats ingested.13 The study also found that those who ate plenty of cruciferous vegetables, such as cabbage, Brussels sprouts and broccoli, had lower rates of colon cancer. So just because it's all right to eat beef doesn't mean you shouldn't eat your broccoli.

Actually, we know one of the mechanisms whereby colon cancer is initiated, and it does not involve meat per se. Colon cancer occurs when high levels of dietary vegetable oils and hydrogenated fats, along with certain carcinogens, are acted on by certain enzymes in the cells lining the colon, leading to tumor formation.14 This explains the fact that in industrialized countries, where there are many carcinogens in the diet and where consumption of vegetable oils and carcinogens is high, some studies have correlated meat-eating with colon cancer; but in traditional societies, where vegetable oils are absent and the food is free of additives, meat-eating is not associated with cancer.

Riding piggy back on the alleged association of beef with colon cancer are supposed links with other cancers, such as breast cancer. Here the evidence shows a similarly inconsistent pattern. Cancer is a disease of rich countries where numerous factors can be fingered—altered fats, fabricated foods, low levels of protective nutrients, high levels of carcinogens—and rich countries consume lots of beef. But association is not the same as cause. Countries where there are more telephones have more cancer, but that does not mean that telephones cause cancer. Fat consumption in general also gets the blame for high rates of breast cancer. But a recent survey showed that women on lowfat diets have just as much breast cancer as those on high fat diets.15

High protein diets are said to cause osteoporosis and Americans are now being advised to avoid beef in order to protect their bones. Once again, it's important to look at the studies carefully. Research that showed a link with bone loss and protein consumption was done with purified protein powders.16 With meat, a natural protein food, there was no negative calcium balance. New evidence indicates that women who eat lots of meat had fewer hip fractures compared to those who avoided it.17

High protein diets are said to contribute to kidney problems but, again, the evidence is contradictory. Although protein restriction can be helpful for those who are suffering kidney failure, there is no evidence that eating meat causes kidney disease.18 The fat-soluble vitamins found exclusively in animal fats are very important for healthy kidney function.

Does beef cause autoimmune diseases or asthma?

What about the accusation that meat contributes to autoimmune diseases and asthma? This hypothesis is predicated on the fact that meat contains arachidonic acid, a fatty acid from which the supposedly pro-inflammatory Series Two prostaglandins—local tissue hormones—are formed. This is one of the nuttiest notions to take hold in the scientific community for a long time. It was promulgated by Barry Sears, author of The Zone, and taken up with a vengeance by the anti-meat forces. These people know nothing about prostaglandins. Some of the prostaglandins that the body makes from arachidonic acid do indeed promote inflammation—which is a very important protective response when you have injured yourself. But the same arachidonic acid also forms the basis of anti-inflammatory prostaglandins that the body uses, when appropriate, to reduce inflammation.19 And besides, the amount of arachidonic acid in beef is very low—less than half a percent of total fat content. It is much lower than the amount of omega-3 fatty acids, the current darlings of the nutritional community, yet none of the voices promoting omega-3 fatty acids ever tell us that we can get them from beef.
What about "Mad Cow Disease"?

Beef consumption in England plummeted recently with the ‘Mad Cow Disease" scare. Mad cow disease, or bovine spongiform encephalopathy (BSE), is a wasting disease of cattle characterized by nervous disorders and weakness, said to be related to Creutzfeldt-Jakob disease (CJD) in humans. Scientists have not been able to link a virus to this disease, so they theorize that an abnormal protein particle called a prion, found in the brains of cattle with BSE and humans with CJD, is the cause. The theory is that these prions are infectious agents, passed along to cows though the practice of animal part feeding and then to humans who eat infected meat, particularly meat from the nervous system, like brain.

There's a lot wrong with this theory. For one thing, BSE is nonexistent in the USA, where animal part feeding has been going on for almost one hundred years. Another is recorded cases of CJD among vegetarians; yet another is the absence of CJD in the Shetlands where scrapie, a disease similar to BSE, is common in sheep and where potted sheeps brain is a national dish.

The research of Mark Purdey, a diary farmer in England, indicates that the mad cow disease epidemic in England occurred in areas where farmers were forced to treat their cattle with organophosphate pesticides in a warble fly eradication program.20 The warble fly makes holes in the cows' backs—not dangerous in itself, but it reduces the value of pelts sold to leather manufacturers. These holes are open doors to the spinal cord and organophosphate pesticides are very toxic to the nervous system. By a complex process, these compounds seem to cause certain proteins to fold in pathological ways—these are the prions that are found in the brains of animals with BSE and humans with CJD. Mineral deficiencies are also involved, particularly magnesium, which is a mineral that protects the nervous system. Finally, a similar

disease occurs among wild animals living in areas of volcanic soils, whose diets are high in aluminum and manganese, minerals known to be toxic to the nervous system. Clusters of human CJD cases are also found in areas where the soil has mineral imbalances, where there are cement factories and where high levels of organophosphate insecticides have been used.

So the answer to CJD and BSE is good soil management and the elimination of neurotoxic compounds in farming—but it's easier to just blame it on beef. By the way, now that animal part feeding has been outlawed, feedlot operators are turning to soy feeds as a protein substitute. Soy is very toxic to cows' livers. Does the use of soy in cattle feeding explain why beef—lean beef—has become politically correct again? After all, the other politically correct meats—chicken and salmon—use up vast quantities of soybean meal in battery feeding and fish farms.
What about E.Coli?

A final slur against beef is that beef is a vector for pathogenic E. coli and therefore a major cause of foodborne illness. Nevermind that E. coli shows up in plant foods like apple juice and salad dressings; and never mind that E. coli is relatively benign and never caused foodborne illness in small amounts until recently. Once again, it's easier to just blame it on beef.

Charles Walters of Acres USA points out that old fashioned all-meat hamburgers, when handled with reasonable care, did not formerly pose a foodborne illness problem. Why, then, are we getting outbreaks of foodborne illness from fast food outlets, where food handling techniques are rigidly controlled—from frozen patty to the grill? He believes that the problem lies in the fact that hamburgers are now bulked out with hydrolyzed soybeans, also called textured vegetable protein, much of it made from genetically modified soybeans. With modern processing, 100 pounds of ground meat can be bulked out to 124 pounds.

E. coli DNA is used as a vector in genetically modified soybeans. The E. coli causing problems in fast food hamburgers is called facultative bacteria, which means that it operates with or without air. Does this bacteria come from the genetically modified soy and is it more dangerous than E. coli that occurs in the guts of cattle? It's a question that needs answering. Says Walters: "This E. coli the news releases keep talking about is not a consequence of slaughterhouse personnel not washing their hands enough, Involved is the negative spin, which is what it lives on. It is in the tissue. It is not errant E. coli leaving the intestinal tract and infecting the product. The scientists know this and this is why they're trying to fall back on irradiation and heavy cooking."21

There are studies that support Walter's theory. One found that spoilage was greater and most rapid in "extended" than in "nonextended" (meaning pure) ground beef.22 Another study showed that coliform counts were significantly higher in beef mixed with textured soy protein after one day of storage in comparison to the 100% ground beef.23

Does beef cause impotence?

The accusation that beef causes impotence is a tactic that can definitely be described as "below the belt." Beef causes impotence by "clogging arteries, limiting blood flow to the extremities." So goes the argument proffered by People for the Ethical Treatment of Animals. Nothing could be more unethical than the implied suggestion that vegetarianism is good for your sex life. We know that vegetarianism—the practice of not eating animal foods—can lead to many deficiencies that directly contribute to impotence, infertility and reproductive difficulties—deficiencies in protein, zinc, vitamins B6 and B12, and fat-soluble vitamins A and D.

The notion that beef is an "acid-forming" food is another favorite vegetarian argument. Beef contains lots of sulphur and phosphorus, which technically form an acid when dissolved in water, but that does not mean that eating meat causes the body to be too acid. Actually, meat provides both high-quality protein and vitamin D (if you eat the fat and organ meats, that is), both of which are needed to maintain proper acid-alkaline balance in the body.

Meat does not putrefy in the gut. Humans are admirably equipped to digest meat. That is the main job of the human stomach, which—unlike the stomach of the cow or rabbit—contains millions of cells that secrete hydrochloric acid. Our intestinal tract is much shorter than that of the vegetarian animals, but somewhat longer than that of purely carnivorous animals. Man is an omnivore—with teeth, stomach, intestines and bowel all designed to handle both animal and plant foods.
Do cattle use land that should be planted with grain?

Vegetarians argue that cows and sheep require pasturage that could be better used to raise grains for starving millions in third-world countries. This argument ignores the fact that a large portion of our earth's land is unsuited to cultivation. The open range, desert and mountainous areas yield their fruits in grazing animals. Grasslands perfectly suited to grazing cover an area in China's interior equal to three times the entire amount of land under cultivation in the rest of the country.24 Citing the arguments of vegetarians, the Chinese government has opted for more intense cultivation of existing agricultural lands rather than development of these untapped regions in order to supply much-needed animal products to the Chinese diet.

A far more serious threat to humanity is the monoculture of grains and legumes, which tends to deplete the soil and requires the use of artificial fertilizers and pesticides. The educated consumer and the enlightened farmer together can bring about the return of the mixed farm, where cultivation of fruits and vegetables is combined with the raising of livestock and fowl in a manner that is efficient, economical and environmentally friendly. Cattle providing rich manure are the absolute basis for healthy, sustainable farming. On marginal land, wise grass feeding practices can actually improve soil quality and restore pasture land. It is not animal cultivation that leads to hunger and

famine but unwise agricultural practices and monopolistic distribution systems.
Do vegetarians live longer than meat eaters?

Since we're talking about vegetarianism, let's examine the claim that vegetarians live longer than meat eaters. The late Dr. Russell Smith, who was a statistician, took a close look at the studies purporting to show that vegetarianism was a healthier life-style.25 In a review of some 3,000 articles in the scientific literature, he found only two that compared mortality data for vegetarians and nonvegetarians. One was a 1978 study of Seventh Day Adventists (SDA's). Although published analyses of this study claim that it showed that the vegetarians lived longer, Smith's analysis of total mortality rates as a function of the frequencies of consuming cheese, meat, milk, eggs and fat attached to meat found that the total death rate decreased as the frequencies of consuming cheese, eggs, meat and milk increased.

The second study was published by Burr and Sweetnam in 1982.26. Once again, although the authors claim that their study showed that vegetarians lived longer, Smith found quite the opposite when he looked carefully at the hard data. He found that the all-cause death rates were slightly greater for vegetarian men compared to nonvegetarian men; and significantly greater for vegetarian women compared to nonvegetarian women.

Vegetarians never mention a study by Dr. Emmanuel Cheraskin who surveyed 1040 dentists and their wives. Those who had the fewest problems and diseases as measured by the Cornell Medical Index had the most protein in their diets.27 Yet almost all the treatments for chronic disease found in alternative publications these days begin with the recommendation of a vegetarian diet. Typical is an article by a Dr. Brodie that appeared in Issue #13 of Alternative Medicine Digest, published by Burton Goldberg.28 Dr. Brodie recommends a "balanced vegetarian diet" of raw fruits and vegetables, whole grains and beans with no "refined sugars, red meat, caffeine and chemically preserved foods." This is truly guilt by association!

But wait! In order to get well, Dr. Brodie recommends certain supplements including vitamin A, vitamin B6, thymus extracts, zinc, cysteine, and bovine cartilage, all of which are largely absent in plant foods and plentifully available in beef! At least they are available if you are eating the whole animal as our ancestors did—meat, organs, cartilage, bones and fat.
Is beef good for you?

What a shame we have demonized red meat because this is one modern food, enjoyed by almost everybody, that is rich in nutrients. Red meat provides complete protein, including sulphur-containing proteins like cysteine. Beef is a wonderful source of taurine and carnitine, needed for healthy eyes and a healthy heart. Beef also provides another key nutrient for the cardiovascular system—coenzyme Q10.

Beef is an excellent source of minerals like magnesium and zinc—you need zinc for clear thinking and a healthy sex life. The fuzzy-headedness that vegetarians mistake for heightened consciousness is really the fog of zinc deficiency. Vitamin B6 is abundant in meat, especially rare meat. Red meat is one of the best sources of vitamin B12, which is vital to a healthy nervous system and healthy blood. Vegetarians are especially prone to vitamin B12 deficiency. One of the first signs of vitamin B12 deficiency is a tendency to irrational anger-—so much for vegetarian claims that we will have a more peaceful, harmonious world if we all just stop eating meat.

If you use the animal bones and hooves to make stock, and use the stock as our ancestors did in soups, stews and sauces, you will get plenty of calcium and the components of cartilage to give you healthy bones and cartilage. If you eat organ meats, as our ancestors did, you will get vital fat-soluble nutrients like vitamin A and D, both of which are essential for protein utilization and mineral absorption.
What about saturated fat?

In fact, the one warning we could give you about meat is not to eat it lean. In spite of claims to the contrary, the diet of the cave man was not one of lean meat. Paleolithic man always ate his meat with fat.

Vilhjalmur Stefansson, who spent many years living with the Eskimos and Indians of Northern Canada, reports that wild male ruminants like elk and caribou carry a large slab of back fat, weighing as much as 40 to 50 pounds. The Indians and Eskimo hunted older male animals preferentially because they wanted this backslab fat, as well as the highly saturated fat found around the kidneys. Other groups used blubber from sea mammals like seal and walrus.

"The groups that depend on the blubber animals are the most fortunate in the hunting way of life," wrote Stefansson, "for they never suffer from fat-hunger. This trouble is worst, so far as North America is concerned, among those forest Indians who depend at times on rabbits, the leanest animal in the North, and who develop the extreme fat-hunger known as rabbit-starvation. Rabbit eaters, if they have no fat from another source—beaver, moose, fish—will develop diarrhea in about a week, with headache, lassitude, a vague discomfort. If there are enough rabbits, the people eat till their stomachs are distended; but no matter how much they eat they feel unsatisfied. Some think a man will die sooner if he eats continually of fat-free meat than if he eats nothing, but this is a belief on which sufficient evidence for a decision has not been gathered in the north. Deaths from rabbit-starvation, or from the eating of other skinny meat, are rare; for everyone understands the principle, and any possible preventive steps are naturally taken."29

Normally, according to Stefansson, the diet consisted of dried or cured meat "eaten with fat," namely the highly saturated cavity and back slab fat that could be easily separated from the animal. Another Arctic explorer, Hugh Brody, reports that Eskimos ate raw liver

mixed with small pieces of fat and that strips of dried or smoked meat were "spread with fat or lard."30 Pemmican, a highly concentrated travel food, was a mixture of lean dried buffalo meat and highly saturated buffalo fat. (Buffalo fat, by the way, is more saturated than beef fat.) Less than two pounds of pemmican per day could sustain a man doing hard physical labor. The ratio of fat to protein in pemmican was 80% to 20%. As lean meat from game animals was often given to the dogs, there is no reason to suppose that everyday fare did not have the same proportions: 80% fat (mostly highly saturated fat) to 20% protein—in a population in which heart disease and cancer were nonexistent.

The beef industry has been forced to be apologetic about its product because it's very difficult to get the fat out of beef. You can reduce the fat content by using hormones, but you end up with a product that is tough and tastes terrible, not to mention full of hormones. Beef producers need to recognize that the fat is the most important part of the beef, rich in components that promote good health and that help you utilize the nutrients in all the other parts of the beef. In addition to vitamins A and D, fat contributes many important fatty acids, including palmitoleic acid, an antimicrobial fat that protects us against pathogens in the gut. If you want to be sure that you don't get foodborne illness from your hamburger, use full fat ground beef.

Fat also provides a substance called conjugated linoleic acid or CLA, at least it does if the animals have been on green grass.31 CLA is a substance that protects us against cancer and that promotes weight loss—that's right, fat can make you thin, if it's the right kind of fat.

And the right kind of fat is also saturated fat which, in spite of what we've been told, plays many important roles in the body chemistry. The scientific literature delineates a number of vital roles for dietary saturated fats—they enhance the immune system,32 are necessary for healthy bones,33 provide energy and structural integrity to the cells,34 protect the liver35 and enhance the body's use of essential fatty acids.36 Stearic acid and palmitic acid, found in beef tallow and butter, are the preferred foods for the heart.37 As saturated fats are stable, they do not become rancid easily, do not call upon the body's reserves of antioxidants, do not initiate cancer, do not irritate the artery walls.

In fact saturated beef fat is one of the most useful fats in the culinary repertoire. As it is very stable and doesn't go rancid when heated to high temperatures, it's perfect for frying. While we don't recommend a lot of fried foods, we know that our children and grandchildren are going to eat them. Fast food outlets used to fry their potatoes in healthy stable beef tallow. They were crisp, tasted delicious and provided many important nutrients. But the phony cholesterol issue has forced these outlets to switch to partially hydrogenated vegetable oil, which is known to cause a host of chronic diseases including cancer, heart disease, bone problems, infertility and autoimmune disease.38

What about the beef industry?

The beef industry should know these things but it doesn't. Instead the National Beef Checkoff Board, funded by mandatory payments from cattlemen, officially endorses consumption of only three and one-half ounce servings of lean beef, about the size of a pack of cards, and runs ads that say things like this: ". . . when it comes to lowering ‘bad' cholesterol levels, lean red meat has the same effects as white chicken meat. That means eating lean beef may reduce the risk of heart disease. Since seven cuts of beef fall between a skinless chicken breast and chicken thigh in terms of total fat, consumers can feel good about eating beef."39 This is damning a good product by faint praise. The Checkoff Board had bought into the phony cholesterol theory and sides squarely with the Diet Dictocrats, calling for irradiation to kill "emerging pathogens" and subsidies to giant processors.

Steve and Jeanne Charter, ranchers from Shepherd, Montana, have refused to make the checkoff payments and are willing to take on the Beef Checkoff Board in court. At preliminary hearings the judge listened while Checkoff bureaucrats defended the Department of Agriculture's food pyramid, based on seven to eleven servings of grain per day, while the Charters championed the juicy steak—to cheers from fellow ranchers.

We need to stand up and support people like the Charters because beef is not the demon food we've been told it is. Beef does not cause disease. In fact beef contributes to good health by providing many important nutrients. All this can be found in the scientific literature. So what's the beef, then, about beef?

Perhaps it also has to do with the characteristics of cattle-herding peoples. Unlike agriculturists, who require an organized social structure highly susceptible to centralized control, the pastoral way of life favors the independent thinker. And the beef industry, for all its faults, is far less subject to monopolistic control than the grain industry is. And it's easier to manipulate prices on grain, a commodity controlled by just a few families,40 than it is to control prices on an industry supported by thousands of cattlemen.

While it is not as true today as it was in the days before the barbed wire fence, cattle keeping families enjoy the luxury of greater independence than those who till the soil or tend vines. They inhabit the wide open spaces and are more accustomed to fending for themselves than relying on their neighbors.

This is not to say there is anything wrong with relying on one's neighbors—in fact, to survive and revive, more cooperation in the beef industry will be needed—but democracy needs a critical mass of the kind of free thinking, independent businessman that you find in the cattle industry. This may be the real reason the Chinese decided not to develop their western grasslands—even small numbers of forward thinking Chinese cowboys would be a threat to that totalitarian society.

People who raise beef not only tend to be free thinkers, they are also good thinkers, because beef provides many factors needed for the modern equivalent of the quick draw—keen, quick minds—including zinc, B12, cholesterol, omega-3 fatty acids, trace minerals, saturated fat and complete protein. In fact, when it comes to good health—it's the beef.

"It's the Beef" was first presented at the Stockman Grass Farmers' annual convention, Dallas Texas, December 1999.

About the Authors

Sally Fallon Morell is the author of Nourishing Traditions: The Cookbook that Challenges Politically Correct Nutrition and the Diet Dictocrats (with Mary G. Enig, PhD), a well-researched, thought-provoking guide to traditional foods with a startling message: Animal fats and cholesterol are not villains but vital factors in the diet,

necessary for normal growth, proper function of the brain and nervous system, protection from disease and optimum energy levels. She joined forces with Enig again to write Eat Fat, Lose Fat, and has authored numerous articles on the subject of diet and health. The President of the Weston A. Price Foundation and founder of A Campaign for Real Milk, Sally is also a journalist, chef, nutrition researcher, homemaker, and community activist. Her four healthy children were raised on whole foods including butter, cream, eggs and meat.

Mary G. Enig, PhD is an expert of international renown in the field of lipid biochemistry. She has headed a number of studies on the content and effects of trans fatty acids in America and Israel, and has successfully challenged government assertions that dietary animal fat causes cancer and heart disease. Recent scientific and media attention on the possible adverse health effects of trans fatty acids has brought increased attention to her work. She is a licensed nutritionist, certified by the Certification Board for Nutrition Specialists, a qualified expert witness, nutrition consultant to individuals, industry and state and federal governments, contributing editor to a number of scientific publications, Fellow of the American College of Nutrition and President of the Maryland Nutritionists Association. She is the author of over 60 technical papers and presentations, as well as a popular lecturer. Dr. Enig is currently working on the exploratory development of an adjunct therapy for AIDS using complete medium chain saturated fatty acids from whole foods. She is Vice-President of the Weston A Price Foundation and Scientific Editor of Wise Traditions as well as the author of Know Your Fats: The Complete Primer for Understanding the Nutrition of Fats, Oils, and Cholesterol, Bethesda Press, May 2000. She is the mother of three healthy children brought up on whole foods including butter, cream, eggs and meat.

Know Your Fats

http://www.westonaprice.org/know-your-fats

Confused About Fats? The following nutrient-rich traditional fats have nourished healthy population groups for thousands of years:

For Cooking
Butter
Tallow and suet from beef and lamb
Lard from pigs
Chicken, goose and duck fat
Coconut, palm and palm kernel oils

For Salads
Extra virgin olive oil (also OK for cooking)
Expeller-expressed sesame and peanut oils
Expeller-expressed flax oil (in small amounts)

For Fat-Soluble Vitamins
Fish liver oils such as cod liver oil (preferable to fish oils, which do not provide fat-soluble vitamins, can cause an overdose of unsaturated fatty acids and usually come from farmed fish.)

The following newfangled fats can cause cancer, heart disease, immune system dysfunction, sterility, learning disabilities, growth problems and osteoporosis:
All hydrogenated and partially hydrogenated oils
Industrially processed liquid oils such as soy, corn, safflower, cottonseed and canola
Fats and oils (especially vegetable oils) heated to very high temperatures in processing and frying.

See our trifold brochures on Myths & Truths About Cholesterol (PDF), All About Trans Fats (PDF), and Why Butter Is Better (PDF). Professionally printed copies are available in our Store.

Do Saturated Fats and Trans Fats Cause Type-2 Diabetes?

Written by Mary G. Enig, PhD
Sunday, July 16 2006 14:23
http://www.westonaprice.org/know-your-fats...type-2-diabetes

Question: I am having a very difficult time defending the benefits of a diet rich in saturated fat. I attend Bastyr University, a naturopathic medical school, and through all my nutriton classes, saturated fat has been deemed unhealthy and detrimental to one's health. For instance, my Diet and Nutrient Therapy class professor cites a 2002 article in the British Journal of Nutrition, "Acute effects of a meal fatty acid composition on insulin sensitivity in healthy post-menopausal women"1 as showing that saturated fat reduces insulin sensitivity, thereby contributing to type-2 diabetes. He also cited a 2002 study in Diabetologia, "Substituting dietary saturated fat with polyunsaturated fat changes abdominal fat distribution and improves insulin sensitivy."2 I would be very interested in your comments on these studies and your views on saturated fat and diabetes.

Answer: Insulin insensitivity has been postulated to be the underlying factor for type-2 diabetes; that is, a condition in which the receptors for insulin on the cell membranes do not work very well. In type-2 diabetes, the pancreas secretes insulin, but since the receptors don't work, the bloodstream contains chronic high levels of insulin and glucose, while little gets into the cell where it is needed.

In the first study cited by your professor, four groups of subjects were fed a breakfast of rice krispies, banana, skimmed milk, "Nesquik" (presumably a chocolate drink) and something called "Marvel," along with 40 grams of fat. The first group got mostly saturated fat from palm oil, the second group got mostly monounsaturated fat from olive oil, the third group got mostly omega-6 fatty acids from safflower oil and the fourth group got mostly omega-3 fatty acids from a combination of safflower oil and fish oil.

Levels of insulin and glucose in the blood were measured at intervals after breakfast and also after a so-called low-fat lunch consisting of cheese pizza (said to contain only 5.4 grams of fat), lettuce, cucumber and tomatoes. Those given the mostly saturated palm oil had higher insulin levels at about one hour after breakfast and lunch compared to the other three groups. However, insulin levels were the same as the other groups two hours after each meal. Blood glucose levels followed a similar curve for all four groups.

This is a very poor study to justify a recommendation against saturated fat. All four groups were on a very unnatural diet high in processed foods, and the fats used do not reflect the type of fatty acid profiles that we consume in normal diets. Furthermore, the levels of insulin in the subjects were not chronically high, as one finds in type-2 diabetes, and the glucose curves were normal for all groups. The study tells us nothing about what happens in real life with people eating real food.

The second study looked at a small group of subjects—a total of 17—who were told to follow a diet rich in saturated (by using more dairy products) or polyunsaturated fatty acids (by using more oils and spreads) for five weeks. When on the saturated fat diet, the subjects had a slightly lower measure of insulin sensitivity but glucose levels and body mass indices were virtually identical.

Again, this study has little to do with real life. The actual amount of saturated or polyunsaturated fat (or trans fat) in each diet was not measured and the number of subjects was too small to be meaningful.

Neither of these studies tells us what happens in real life in subjects who eat a diet high in natural saturated fats compared to those whose diets contain a lot of vegetable oils. The fact that the researchers are strong in their condemnation of saturated fats after such trivial findings is strong evidence of bias.

The real problem is that recommendations to avoid saturated fats almost invariably result in people consuming more trans fats. There is no question but that the trans fats have been shown to have a detrimental effect on the incidence and treatment of type-2 diabetes. The saturated fats, on the other hand, have no effect when appropriate comparisons are made.3
Very good studies indicate that trans fats interfere with insulin receptors and therefore with insulin resistance. The saturated fats do not.4

The recommendations regarding dietary saturated fats intake versus trans fats intake for the past number of years have been very confusing to the public, and judging from the articles, also confusing to the researchers. Trans fats are mistaken by many of the health professionals for saturated fats although they are not similar in their effects on the human body, just similar in the manner of stability in the baking or cooking realm.

"So Many Nutrition Recommendations Contradictory or Compatible?" written by a major dietitian from the American Dietetic Association lists the amounts of fat and different fats that are acceptable. According to their recommendations, total fats could represent 20-35 percent of the calories in the diets of individuals as listed in the Dietary Reference Intakes, 25-35 percent as called for by the National Cholesterol Education Program, but the American Diabetes Association says that fat intake should be individualized (expert consensus). However, recommendations for the type of fat mixes the saturated fats and the trans fats, as do almost all of the writers in these organizations. The report notes that a diet with only 5 percent of the total energy from saturated fats is adequate; and yet research shows that the normal level of saturated fats in the tissues is much higher.5

Another example of inappropriate conclusions drawn from a research project comes from Colorado State University, where researchers decided that a "saturated fat byproduct" was a potential contributor to type-2 diabetes. This so-called saturated fat metabolite is ceramide. Ceramide is a lipid molecule made in the body from something called sphingosine and a fatty acid (which could be oleic acid, a so-called good fatty acid). This molecule is used to make sphingomyelin, which is one of the structural elements in the lipid bilayer, as well as being a cellular signal molecule. Sphingomyelin is one of the lipid building blocks of the myelin sheath so important for nerves.

Ceramides are interesting molecules currently being studied for a role in programmed cell death, and substances known to induce ceramide production are components such as endotoxins and chemotherapeutic agents more likely to be from the stress of trans fats than from the normal saturated fats, which are such important building blocks of our tissues. The saturated fat in the study was based on in vitro measures of free fatty acids and therefore does not represent a diet intake.6

In summary, the studies cited by your professor and others do not represent what happens in the real world with people eating real food. Think of it this way: type-2 diabetes is a new disease, one that has now reached epidemic proportions. Type-2

diabetes did not exist 100 years ago when our diets were very rich in saturated fats. Type-2 diabetes appeared when trans fats came into the diet, and has become epidemic as people are eating more and more foods containing trans fats. And since we know that trans fats interfere with insulin receptors in the cells, it is clear that the blame lies with new industrial fats, not traditional saturated fats.

View Full Version: Cholesterol drugs could cut clots

Title: Cholesterol drugs could cut clots
Description: *[AND CREATE SERIOUS DISEASE!]*

TheUnhivedMind - March 18, 2011 04:40 PM (GMT)

Cholesterol drugs could cut clots

Blood clots stop bleeding, but can also be deadly

17 March 2011 Last updated at 00:02
http://www.bbc.co.uk/news/health-12737549

Drugs which can regulate levels of cholesterol in the blood may also reduce the risk of dangerous clots, say scientists.

Blood clots can result in stroke or heart attack.

Researchers, writing in the journal Blood, reduced the size and stability of blood clots in mice and said the discovery could lead to new drugs.

The British Heart Foundation said it was an exciting discovery which could result in more effective treatments.

Around 32,000 people in the UK die after developing a blood clot.

The team at the University of Reading was investigating how clots form and say they were surprised to find that protein, LXR, was involved.

LXR is already known to control levels of cholesterol and drug companies have been targeting it for new treatments.

The researchers found that drugs which affect LXR reduced the size and stability of growing clots in experiments on mice.

Professor Jon Gibbins, from the University of Reading, said: "It's really quite exciting

really, it could be quite an important discovery."

"While blood clotting is essential to prevent bleeding, inappropriate clotting within the circulation, known as thrombosis, is the trigger for heart attacks and strokes - which kill more people in the UK each year than any other disease.

"This study paves the way for new and more effective medicines to prevent thrombosis."

Professor Jeremy Pearson, associate medical director at the British Heart Foundation, said: "Both anti-clotting and cholesterol lowering drugs are vital in reducing the chance of a heart attack or stroke in high-risk patients, but are not always effective and don't suit all patients because of the risk of side-effects.

"This exciting discovery shows that drugs which lower cholesterol through targeting LXR protein can also reduce harmful blood clotting - potentially opening up paths towards new, more effective treatments."

View Full Version: Cholesterol 'does not predict stroke in women'

Title: Cholesterol 'does not predict stroke in women'

TheUnhivedMind - February 22, 2011 12:39 AM (GMT)

Cholesterol 'does not predict stroke in women'

Cholesterol levels do not predict stroke in women, say scientists

21 February 2011 Last updated at 05:09
http://www.bbc.co.uk/news/health-12505230

High levels of cholesterol do not predict the risk of stroke in women, according to researchers in Denmark.

They did detect an increased risk in men, but only when cholesterol was at almost twice the average level.

The report in Annals of Neurology recommends using a different type of fat in the blood, non-fasting triglycerides, to measure the risk.

The Stroke Association said triglyceride tests needed to become routine to reduce the risk of stroke.

A total of 150,000 people have a stroke in the UK each year. Most are ischemic strokes, in which a clot in an artery disrupts the brain's blood supply.

The research followed 13,951 men and women, who took part in the Copenhagen City Heart Study.

During the 33-year study, 837 men and 837 women had strokes.

Poor predictor

They reported that the cholesterol levels in women were not associated with stroke,

while there was only an association in men with levels higher than 9mmol/litre. The average in UK men is 5.5.

The researchers at Copenhagen University Hospital said this was "difficult to explain" as LDL, or bad, cholesterol is known to cause atherosclerosis which can block arteries.

They did notice a link, in both men and women, between the risk of stroke and non-fasting triglycerides.

They believe these fats are a marker for "remnant cholesterol" which is left behind when other forms of cholesterol are made.

Dr Peter Coleman, deputy director of research at The Stroke Association said: "Tests for triglyceride levels aren't routinely carried out in the UK unless there is significant concern."

"We know that high levels of fats, such as cholesterol, increase your risk of having a stroke. However, this research shows the importance of measuring the fat triglyceride, as well as cholesterol.

"This study highlights the importance of measuring triglycerides routinely in order to reduce a person's risk of stroke."

View Full Version: Health Authorities Want Depression-Causing Drugs

Title: Health Authorities Want Depression-Causing Drugs
Description: *Added To Water Supply*

TheUnhivedMind - January 23, 2011 10:41 PM (GMT)

Health Authorities Want Depression-Causing Drugs Added To Water Supply

Paul Joseph Watson
January 20, 2011
http://www.infowars.com/health-authorities...o-water-supply/

Health authorities are pushing for drugs to be added to public water supplies that cause depression and memory loss, as a new study shows that the dangers of statins have been deliberately underplayed by drug companies, in a chilling throwback to how the population in Aldous Huxley's Brave New World were mass medicated with Soma to keep them docile and easy to control.

Statins are taken by tens of millions of people worldwide, a boon for drug companies like Merck, whose chief executive Henry Gadsden back in 1975 dreamed of being able to sell a drug to people who had no immediately identifiable illness, or as Mike Adams writes, "They needed a way to sell drugs to healthy people." Statins were born and the financial windfall for Big Pharma quickly followed.

Drug companies claim that statins have been proven to lower cholesterol and help prevent heart disease and strokes, leading many health experts to insist that they be artificially added to public water supplies, but dangerous side-effects buried by drug companies conducting statin trials have now come to light, in addition to the fact that "for three quarters of those taking them, they offer little or no value."

A new study published in the Cochrane Library, which reviews drug trials, examined data from 14 drugs trials involving 34,000 patients and found evidence of "short-term memory loss, depression and mood swings," that had been deliberately underplayed by the drug companies funding the research.

The researchers warn that, “Statins should only be prescribed to those with heart disease, or who have suffered the condition in the past. Researchers warn that unless a patient is at high risk of suffering a heart attack or stroke, statins may cause more harm than good.”

However, despite the fact that statins have also been linked to a greater risk of liver dysfunction, acute kidney failure, cataracts and muscle damage, health authorities have been pushing for the drug to be added to public water supplies as part of a mass medication program that is not only illegal without consent, but also threatens a plethora of unknown consequences.

Only last week, George Lundberg, MD, the editor of MedPageToday, which is a mouthpiece for the American Medical Association, wrote an op-ed entitled, Should We Put Statins in the Water Supply?

In May 2008, renowned cardiologist Professor Mahendra Varma called for statins to be artificially added to drinking water.

Putting statins in the water supply was also considered during a November 2008 discussion which featured Robert Bonow, M.D., of Northwestern University in Chicago, Gordon F. Tomaselli, M.D., of Johns Hopkins University in Baltimore, and Anthony De Maria, M.D., of the University of California at San Diego.

Also in November 2008, CNBC aired a segment lauding the effectiveness of statins, after which one of the hosts remarked, “Why don’t they just put statins in the water supply,” to which CNBC’s medical expert replied, “A lot of people have said that and they are in the water in fact.”

The idea of adding drugs to the water supply to biochemically manipulate the thoughts and emotions of populations has gone from the realm of science fiction in Aldous Huxley’s Brave New World, where people were mass medicated with Soma to keep them docile and easy to control, to an imminent reality.

Indeed, during a March 20, 1962 Berkeley University speech, Huxley spoke of how humans would be made to “love their servitude” via the state-sponsored introduction of mind-altering drugs.

“There will be, in the next generation or so, a pharmacological method of making people love their servitude, and producing dictatorship without tears, so to speak, producing a kind of painless concentration camp for entire societies, so that people will in fact have their liberties taken away from them, but will rather enjoy it, because they will be distracted from any desire to rebel by propaganda or brainwashing, or brainwashing enhanced by pharmacological methods. And this seems to be the final revolution,” said Huxley.

In a 2008 paper titled, “Fluoride and the Future: Population Level Cognitive Enhancement,” Oxford professor Julian Savulescu explored how populations of the future could be mass-medicated through pharmacological “cognitive enhancements” added to the water supply.

In December 2009, we reported on how Japanese health authorities were considering adding trace amounts of lithium to public water supplies as a “mood stabilizer” in a bid to lower the suicide rate. Fox News medical expert Dr. Archelle Georgiou gave the concept tacit approval when she labeled the study an “interesting concept” and refused to even mention the moral aspects of mass drugging people against their will.

In his 1977 book Ecoscience, current White House science czar John P. Holdren also advocated adding sterilant drugs to the water supply as part of a program of “involuntary fertility control”.

Of course, a huge number of Americans are already being mass medicated against their will through the water supply by the artificial addition of sodium fluoride, from which one of a myriad of debilitating health effects includes lowered IQ and increased docility. Indeed, as Joseph Borkin documented in his book The Crime and Punishment of I.G. Farben, the first occurrence of artificially fluoridated drinking water on Earth was found in Germany’s Nazi prison camps. The Nazis explained that the reason for mass-medicating water with sodium fluoride was to sterilize women and coerce the victims of their concentration camps into calm submission.

Statins 'may cause loss of memory and depression'

By Sophie Borland
Last updated at 7:46 AM on 19th January 2011
http://www.dailymail.co.uk/health/article-...depression.html

Cholesterol-lowering pills taken by millions of Britons may cause memory loss and depression, researchers warn.

They say not enough is known about the level of harm posed by statins, prescribed to prevent heart disease and strokes.

Leading doctors say that the drugs should only be taken by patients for whom the benefits of the drug outweigh any potential risks.

More than seven million people in Britain now take statins – as many as one in three adults over the age of 40.

They are extremely effective in lowering levels of cholesterol, the fatty substance in the blood that clogs up arteries leading to heart attacks and strokes.

Many people over the age of 45 are routinely prescribed statins by their GPs if they have slightly high blood pressure or cholesterol.

In addition low-dose pills are increasingly bought over the counter without a prescription. Although they have been proven to be extremely effective – saving up to 10,000 lives a year – researchers warn that not enough is known about their risks.

They warn statins should only be prescribed to those with heart disease, or who have

suffered the condition in the past. Researchers warn that unless a patient is at high risk of suffering a heart attack or stroke, statins may cause more harm than good.

The study, published in the Cochrane Library, which reviews drug trials, also points out that the vast majority of trials have been carried out by drugs companies who may play-down any possible risks. Some patients taking statins have suffered from short-term memory loss, depression and mood swings.

Previous studies have also linked the medication to a greater risk of liver dysfunction, acute kidney failure, cataracts and muscle damage known as myopathy.

The researchers examined data from 14 drugs trials involving 34,000 patients.

They found that although the drugs did prevent heart attacks and strokes, there was not enough evidence to prescribe them to patients with no previous history of heart disease.

Professor Shah Ebrahim, from the London School of Hygiene and Tropical Medicine said: ‘When you put the evidence together you certainly find it supports the use of statins. But we found that evidence of potential harm is not being taken seriously.

‘The adverse effects are not included in the trials.’

Lead researcher Dr Fiona Taylor, added: ‘The decision to prescribe statins in this group [who have no history of heart disease] should not be taken lightly.’

Amy Thompson, senior cardiac nurse at the British Heart Foundation, said: ‘This systematic review echoes what we already know – that statins have huge benefits for people with heart and circulatory disease, or those who are high risk – they help to reduce the risk of heart disease including heart attacks.

‘It is still unclear whether statins provide any real benefits for people without heart and circulatory disease and who are at low risk.’

All Good Cholesterol Doesn't Help Equally Against Heart Disease in Study

By Michelle Fay Cortez - Jan 12, 2011 10:00 PM GMT+0000
http://www.bloomberg.com/news/2011-01-12/a...e-in-study.html

Some good cholesterol may be less efficient at ferrying fat from arteries, says a study suggesting why drugmakers have struggled to craft treatments that prevent heart attacks and death by simply raising levels in the body.

The research, released today in the New England Journal of Medicine, may help explain earlier findings that increasing good cholesterol doesn’t always reduce cardiac risk, said Daniel Rader, director of preventive cardiology at the University of Pennsylvania in Philadelphia. While people with naturally high levels of good cholesterol have a lower risk of heart disease, drugmakers haven’t succeeded in developing medicines that mimic its effects.

Rader’s team used a laboratory test to determine how well good cholesterol, known as HDL, functioned. Patients with the most-efficient particles had a lower risk of heart disease, even after overall levels of HDL were taken into account, the study found. The results may benefit companies such as Merck & Co. in Whitehouse Station New Jersey, Roche Holding AG in Basel, Switzerland, and Eli Lilly & Co. in Indianapolis, which are developing drugs that target good cholesterol.

“Raising HDL levels per se may not be the be-all and end- all in terms of developing new therapies,” Rader said. “Two people with the same HDL levels may have very different degrees of function that affects their risk of developing heart disease.”

A measure of HDL function “may help us better select among new therapies,” he said.

Drug Development

Pharmaceutical companies have been developing drugs to boost good cholesterol levels for more than a decade in hope of preventing heart attacks and reducing cardiovascular disease. While drugs used to reduce bad cholesterol have slashed rates of heart disease during the past 20 years, such illness remains the leading cause of death worldwide.

New York-based Pfizer Inc.'s setback with the HDL-raising drug torcetrapib four years ago led Merck and Roche to reassess their good cholesterol strategy. Torcetrapib, from Pfizer, unexpectedly increased death rates even as it raised levels of good cholesterol.

Merck and Roche continued their HDL programs after concluding that their experimental products don't carry a similar risk. Studies of drugs known as fibrates that raise good cholesterol levels have failed to show lower heart disease risk, while Niaspan from Abbott Laboratories in Abbott Park, Illinois, boosts HDL levels and reduces artery-clogging plaque.

Previous research showed significant differences in how HDL is made and how it functions, the investigators said. The study didn't analyze individual HDL particles, and more work is needed to determine what is responsible for the differences in its effectiveness.

Family Study

In a second New England Journal study released today, researchers from the Netherlands described a family with a mutation in the gene responsible for ferrying cholesterol to the liver. While family members with the mutation had higher levels of good cholesterol, it was less effective at removing the fatty plaque and signs of clogged arteries were about the same.

The findings support the idea that good cholesterol may be converted into a dysfunctional form that no longer protects the heart, wrote Jay Heinecke, a professor of medicine at the University of Washington in Seattle, in an editorial. The damaged HDL may add to the patient's risk of coronary disease, he wrote.

In Rader's study, investigators conducted laboratory tests using blood taken from 793 people, including healthy volunteers and heart disease patients. After removing the bad cholesterol, the scientists tested how well the remaining good cholesterol extracted fatty lipids from cells in the blood vessel wall that accumulate plaque and contribute to heart disease.

"We showed that HDL function was a better predictor of the likelihood of having heart disease rather than just measuring HDL levels alone," Rader said. "This advances the

concept that the function of HDL is what may directly protect people against heart disease."

Description: *AFTER ALL, SAY SCIENTISTS*

TheUnhivedMind - January 7, 2011 02:10 AM (GMT)

FULL-FAT MILK AND BUTTER MAY NOT BE BAD FOR US AFTER ALL, SAY SCIENTISTS

Link between disease and saturated fats in cheese ‘is unproven’.

Friday January 7,2011
By Jo Willey
http://express.co.uk/posts/view/221613/Ful...-say-scientists

BUTTER, cheese and full-fat milk might not be as bad for our health as had been thought.

Current health advice dictates that saturated fat from dairy products can clog arteries, leading to heart disease and strokes.

But new research claims that such fats may have got a bad reputation and evidence linking them to disease is far from clear-cut.

Recent advances in the study of saturated fats have shown that the link between an intake of the “bad” fat and health had been over-simplified in dietary advice.

Several studies appear to imply that genetics, lifestyle and age could all play a significant part in how badly your body is affected by saturated fat.

Some scientists believe that such fats are “lumped in” with others, which distorts health advice.

A series of research articles published in the journal Lipids provides a snapshot of

recent advances in saturated fat and health research. This is based on science presented at the 100th American Oil Chemists' Society annual meeting.

Dr Bruce German, professor and chemist in the Department of Food Science and Technology, University of California at Davis said: "Assuming that saturated fat at any intake level is harmful is an over-simplification and not supported by scientific evidence.

"The relationship between dietary intake of fats and health is intricate and variations in factors such as human genetics, age and lifestyles can lead to different responses."

One scientist, Professor Philippe Legrand, studied how saturated fatty acids play various roles in the body.

He concluded that saturated fats can no longer be considered a single group in terms of structure, metabolism and cellular function and recommended that health advice grouping them together needed to be updated.

And results from a research review conducted by Dr Dariush Mozaffarian at the Department of Epidemiology and Nutrition at Harvard University School of Public Health, found that the effects of saturated fat intake on cardiovascular disease risk depend upon simultaneous changes in other nutrients.

The review found that replacing saturated fat with mono-unsaturated fat had an unclear effect on heart disease.

And replacing saturated fat with carbohydrates was found to be ineffective and even harmful, especially when refined carbohydrates such as starches or sugars were used in place of fat.

Dr Cindy Schweitzer, technical director of the worldwide Global Dairy Platform, called for more research to clarify the effects of saturated fat.

She said: "All recent research advances add to the growing body of science re-assessing the role of saturated fat in the diet. Whether it's nutrient replacement or better understanding the role certain foods can play in cardiovascular disease risk, saturated fat is definitely not as bad as once thought."

View Full Version: POISONOUS STATINS TO INCREASE DOSAGE

Title: POISONOUS STATINS TO INCREASE DOSAGE
Description: *[THESE KILL YOU PEOPLE BEWARE!!!]*

TheUnhivedMind - November 9, 2010 03:01 AM (GMT)

Statin increase 'will save lives'

Higher doses can cause side effects

9 November 2010 Last updated at 00:29
http://www.bbc.co.uk/news/health-11712569

Raising the dose of cholesterol-lowering drugs could prevent many more heart attacks and strokes, say researchers.

UK and Australian teams compared a standard statin treatment with a more intensive therapy, publishing results in the Lancet medical journal.

They concluded that higher doses cut heart attacks and deaths by 13%.

Experts warned that a bigger dose of the most popular statin **could produce many more cases of side effects.**

Statins cut levels of **so-called** "bad" LDL cholesterol, and the risk of heart attacks and strokes in higher risk patients.

Almost two million people in the UK are prescribed them, and one type is even available over the counter at pharmacies to patients assessed as at "moderate" cardiovascular risk.

Some studies have suggested that even greater benefits could be achieved if bigger doses of the drug were prescribed.

The two studies in the Lancet were carried out at the universities of Oxford and Sydney,

and pooled the results of dozens of other trials to give a more reliable verdict on the likely benefits and risks of doing this.

In the first study, when a standard statin regime was compared to an "intensive" regime, further drops in LDL cholesterol levels were produced.

In turn, there was a 15% further reduction in "major vascular events" - which included a 13% drop in heart deaths and non-fatal heart attacks, 19% fewer operations to treat heart disease, and a fall of 16% in the number of strokes.

The other study also revealed falls in LDL cholesterol and "vascular events".

Commenting on the study, two academics, Professor Bernard Cheung and Professor Karen Lam, from the University of Hong Kong, said that people with a "substantial" heart or stroke risk should have intensive statin treatment.

Even those with apparently low LDL cholesterol could benefit, they said.

They added: "At the population level, **statins are underused**, so the urgent priority is to identify people who would benefit most from statin therapy and to lower their LDL cholesterol aggressively, with the more potent statins if necessary."
Balance of risks

However, the study authors warned that simply raising the dose of the most commonly-used statin in the UK, simvastatin, the version available direct from pharmacies, might be counterproductive.

A rare side-effect of low-dose simvastatin is muscle weakness, known as myopathy. In some cases this can lead to more serious muscle damage.

At a low dose, three in 10,000 (0.03%) patients developed myopathy, but when a higher dose of simvastatin was prescribed, this jumped to nine in a 1,000 (0.9%).

Dr Louise Bowman, one of the researchers, said: "It may be safer to lower cholesterol using low doses of the more potent statins rather than increasing the dose of simvastatin."

This advice was echoed by the British Heart Foundation, which part-funded the study.

Professor Jeremy Pearson, associate medical director at the British Heart Foundation, said that simply "ramping up the dose" of simvastatin might not be the best option.

He said: "We know that cholesterol is a major risk factor for heart disease - cutting it cuts your risk of a heart attack. However it's been unclear whether going the extra mile

to lower cholesterol even further, pays off."

TheUnhivedMind - November 9, 2010 03:08 AM (GMT)

Folks the side effects they mention above with the muscles are all tied to damage to the Spleen. This will cause serious knock on effect problems with the Lungs and Kidneys then on and on. It seems these days that the Spleen is under serious attack by many chemicals etc. Remember its your Spleen which provides and distributes qi around your body whilst boosting immunity and looking after your weight. Any wonder so many people are fat? Notice the connection of fat to diabetes? The Spleen controls the digestive system and governs the Pancreas. Statins kill and no one should ever take them otherwise your quickly assured Liver damage and the rest of the hellish problems. Cholesterol is tied directly with your Liver so is it wise to destroy the Liver further? Of course not. Want to aid your cholesterol? I strongly suggest the use of Artichoke and also Hawthorn fruit. Notice how they want to drug everyone with these poisons? This is eugenics and its growing rapidly to meet the population reduction needs of Memorandum 200 and Global 2000 report.

Halvor - November 9, 2010 06:18 PM (GMT)

I think it is also prudent to point out that the lowering of cholesterol propaganda is a total wild-goose chase. The rationale is that high cholesterol is a contributing factor in ischemic heart disease (atherosclerosis leading to angina and heart infarction). That is a complete ruse. High cholesterol levels is an indicator of increased risk of developing such illnesses, however it is not the cause of it.

I am leaning on the research done by Linus Pauling and Matthias Rath with regards to vitamin C, as well as work done in orthomolecular medicine. High levels of lipids in the blood is the body's reaction to damage in the arterial wall linings. The lipids function as glue which is applied to close microfissures in the epithelial tissue (epithelium).

The epithelium is elastic tissue found in skin and mucous tissue, such as in the gastro-intestinal tract and in the cardiovascular system. The protein responsible for giving the epithelium its elasticity is collagen. Collagen is the most abundant among all proteins in the human body. In order to synthesize collagen the most important ingredient is ascorbic acid, or vitamin C. Unfortunately, humans, due to a genetic aberrance found in only very few mammals, human beings being one of those, are unable to make vitamin C internally. Pauling and Rath discovered that most people have a persistent (and progressive) deficit in their vitamin C intake compared to the amount which it would take to replenish the collagen which is lost to cell regeneration (remember, the epithelial cells are the most frequently renewed cells in the body) and morbidity (infectious disease, cancer, trauma, etc.).

So most people as they grow older will have atrofied epithelial tissue, and in the cardiovascular system this shows itself as thin and frail blood vessels with diminished elasticity. In the area around the heart this diminished elasticity is particularly critical because of the constant growing and shrinking commanded by the heart's pumping action. Ichemic heart disease occurs due to damage done to the arteries which supply blood to the heart muscle itself.

Anyway, watching one's cholesterol is a complete ruse. And following protocols to reduce it without first having addressed the real problem is indicative of a critical lack of self care ability.

View Full Version: Coming soon to Europe: Chewable cholesterol drugs

Title: Coming soon to Europe: Chewable cholesterol drugs
Description: *for Children like candy for next campaig*

TheUnhivedMind - October 31, 2010 10:24 PM (GMT)

Coming soon to Europe: Chewable cholesterol drugs for children (like candy)

Friday, October 29, 2010 by: David Gutierrez
http://www.naturalnews.com/030213_choleste...s_children.html

The European Commission has approved a chewable version of Pfizer's blockbuster cholesterol drug Lipitor, for use in children over the age of 10.

Pfizer has announced that following this approval, it will apply for a six-month patent extension for Lipitor, which is the best-selling drug in the world.

Both the United States and the European Union offer six-month patent extensions as an incentive for drug companies to conduct safety and effectiveness tests of their products in children, which is not required by law. Based on Pfizer's tests of Lipitor in children, the United States has already granted such an extension and the European Union is expected to follow suit.

Lipitor pulled in nearly $13 billion for Pfizer in 2009 alone, accounting for 23 percent of the company's sales income. The patent on the drug is due to expire at the end of November 2011, which has set the company scrambling for ways to increase Lipitor sales before then. A six-month extension alone could bring the company hundreds of millions of dollars.

In 2002, the FDA approved Lipitor for use in children with a genetic condition leading to dangerously high cholesterol levels. However, the drugs are now regularly being prescribed to children whose cholesterol levels are heightened due to obesity.

The rate of childhood obesity has doubled since the mid-1990s. It now stands at 17

percent.

Lipitor is one of the drugs known as statins, which lower levels of LDL cholesterol in the blood. Research suggests that this may lower the risk of heart attack and stroke in some people. The drugs can carry severe side effects, however, which has led to concerns that they may be over-prescribed. Lipitor, for example, can produce muscle pain and weakness, and should never be used by pregnant or nursing women, or people with liver problems.

TheUnhivedMind - October 31, 2010 10:25 PM (GMT)

You'll also notice they'll add Aspartame to these drugs as the sweetener so you'll have another added poison to this already terribly poison which kills the Liver and Spleen function.

View Full Version: STATIN POISONS NOW PUSHED ON ARTHRITIS PATIENTS

Title: STATIN POISONS NOW PUSHED ON ARTHRITIS PATIENTS
Description: *[YOU WILL BE STATINISED SOMEHOW]*

craig-oxley - September 8, 2010 01:25 PM (GMT)

Statins may cut arthritis risk, study suggests

Rheumatoid arthritis can be extremely debilitating

8 September 2010 Last updated at 00:43
http://www.bbc.co.uk/news/health-11219708

Taking statins may reduce the risk of rheumatoid arthritis, a study suggests.

Israeli researchers looked at 1.8m patients and found fewer incidents of the joint condition among those who took the cholesterol-busting drugs.

It was thought statins could ease symptoms in those already diagnosed by stopping the over-production of tissue between the joints.

But the Maccabi Healthcare Services Research Institute study suggested they could stop it developing altogether.

The team discovered 2,500 cases of rheumatoid arthritis, the debilitating inflammation of the joints which affects about one in 100 people.

Heart and joints

They found that those people who were on statins, now commonly prescribed to prevent heart attacks, were 50% less likely to develop the condition than those who were not regularly taking the drugs.

The relationship in this trial between adherence to statin therapy and incidence of rheumatoid arthritis is unclear, but the work builds on existing knowledge.

However, the researchers acknowledged that the work, published in the journal PLOS Medicine, now needed to be confirmed in other populations.

Jane Tadman, of Arthritis Research UK, said: "Our own published research and that of researchers in Japan has shown a modest but significant effect on inflammation in rheumatoid arthritis, and this latest piece of research adds further evidence of this link.

"We now need larger clinical trials to confirm further that statins can reduce the risk of developing rheumatoid arthritis."

Title: Change Dietary Oil and Reduce Your Risk of Disease

craig-oxley - August 25, 2010 11:27 AM (GMT)

Change Dietary Oil and Reduce Your Risk of Disease

Wednesday, August 25, 2010 by: Amie Sugat
http://www.naturalnews.com/029555_soybean_oil_disease.html

The corn, canola, and soybean oil companies do not want the consumers to know these hidden facts about their products. These products were never meant for consumption by living organisms. They were mean for industrial purposes such as lubricating equipment, mixing paints, and even the next generation of fuel for automobiles. Industries realized that they were cheaper to produce than healthy fats and oils, and since many are by-products, they are plentiful.

Dangers of Vegetable Oils

The minute amounts of oils found in whole grain corn and soybeans are healthy, bound to the antioxidants that prevent them from being dangerous. However, as a mass produced product, manufacturers needed the oil to keep longer. The fatty acids found in grains turn rancid rather quickly after being separated from the product.

To make them last longer the antioxidants and phytochemicals are removed; the oil is processed using chemicals such as hexane and chlorine bleach. Then they are deodorized. Further, most oils have food coloring and preservatives added as well as chemicals to mask the smell of the rancid oils.

Damage done to the body by these rancid refined oils includes: loss of vision, disruption of the central nervous system, respiratory illness, anemia, constipation, low birth weights, irritability, problems thinking, and foggy memory. Long term use causes increased risk of cancer, increased risk of atherosclerosis, increase in heart attacks and strokes, digestive disorders, pain sensations, and a host of other problems associated

with poor nutrition and vitamin deficiencies.

Where They Come From

Canola oil comes from genetically engineered rapeseed. Rapeseed is easy to produce because it is so toxic not even insects want it. It was originally used as a lubricant for machinery in small industries. It has been proven to cause lung cancer and heart disease. It was originally used in Europe in farm animal feeds. These animals went blind, began exhibiting various diseases, and finally went mad and began attacking people.

Soybean oil comes from soybeans of course; while the mass media glorifies the soybean, it really has a dark side. Soybeans and soybean oil are not health foods. Soybean product consumption is linked to infertility, increased cancer and infantile leukemia, Type1 diabetes, and precocious puberty in children fed soy formula. "Clinical and laboratory studies link soy to malnutrition, digestive distress, thyroid dysfunction, cognitive decline, reproductive disorders, cognitive, immune system breakdown, and even heart disease and cancer," Says Liz Lipski PhD CCN. Dr. Mercola says, "Soy formula...also has over 1,000 percent more aluminum than conventional milk based formulas."

Corn Oil's polyunsaturated acids are the prime requirements for cancer growth. Long-term corn oil use is associated with colon cancers because it inhibits an enzyme used to prevent cancer growth. Further, Japanese researchers have found that long-term use of con oil and other corn products increases mortality rates and esophageal cancers.

Change Your Oil

The reason these oils have such a negative effect on the body is simply because they are indigestible. They inhibit the natural enzyme functions of the body that turn fats into fuel and vitamins into chemicals the body can absorb, and they bind to minerals such as calcium, phosphorous and magnesium. However, the effects are not immediately felt; the onset of health complications often takes ten or more years before symptoms begin to show up and have a dramatic effect on the body.

Switching from a diet high in these polyunsaturated and refined vegetable oils to one with raw or at least minimally processed medium chain fatty acids can thus reduce our risk of cancer, heart disease, and various other diseases associated with these dangerous refined oil products.

Title: Heart Disease: Understand the Difference between
Description: *Truth and Myth*

craig-oxley - August 23, 2010 12:21 PM (GMT)

Heart Disease: Understand the Difference between Truth and Myth, Part I

Saturday, August 21, 2010 by: Dr. David Jockers
http://www.naturalnews.com/029533_heart_disease_myths.html

Heart Disease was considered a very rare disease in the early 20th century. The lipid hypothesis theory that saturated fat and cholesterol cause heart disease changed the shape of the nation in the 1950s. Society began to run away from saturated fat and cholesterol and turned to man-made processed fats as a replacement. As corporate food processing machines began to become more popular so did the occurrence of heart disease. Today, the lipid hypothesis can be considered one of the greatest scientific myths to date.

The lipid hypothesis was developed by Ancel Keys in the 1950s. This theory states that there is a direct relationship between the amount of saturated fat and cholesterol in the diet and the incidence of coronary heart disease. With questionable evidence, Keys went about writing articles and promoting this hypothesis throughout the medical world. Meanwhile, hundreds of subsequent studies testing this hypothesis have found differing conclusions. Despite the lack of evidence this notion took off throughout the healthcare world and was fueled by the vegetable oil and food processing industries that sought to benefit from this key finding.

Close to 90% of all well-planned, properly documented studies investigating the lipid hypothesis do not support the claim that "artery-clogging" saturated fats and dietary cholesterol cause heart disease. Scientists examining a clogged artery will only find that about 26% of the fat in the plaque is saturated. More than half of the fat is polyunsaturated.

According to Dr. Mary Enig, PhD saturated fats & cholesterol are necessary for the

following reasons:

1.Saturated fatty acids and cholesterol constitute at least 50% of the cell membranes. They give our cells necessary stiffness and integrity.

2.They play a vital role in the health of our bones. For calcium to be effectively incorporated into the bone at least 50% of the dietary fats should be saturated.

3. Cholesterol is the precursor to Vitamin D & major hormones that regulate stress, energy & sex hormone (estrogen, progesterone, DHEA, testosterone, etc) function.

4.They lower Lp(a), a substance in the blood that indicates proneness to heart disease. They protect the liver from alcohol and other toxins such as Tylenol.

5.They enhance the immune system and act as an anti-depressant by enhancing serotonin receptor function. Low cholesterol is highly associated with violent and aggressive behavior, depression, and suicidal tendencies

6.They are needed for the proper utilization of essential fatty acids. Elongated omega-3 fatty acids are better retained in the tissues when the diet is rich in saturated fats.

7.Saturated 18-carbon stearic acid and 16-carbon palmitic acid are the preferred foods for the heart, which is why the fat around the heart muscle is highly saturated. The heart draws on this reserve of fat in times of stress.

8.Short- and medium-chain saturated fatty acids have important antimicrobial properties. They protect us against harmful microorganisms in the digestive tract. Cholesterol plays a vital role in the repair and maintenance of the intestinal wall, preventing leaky gut syndrome, ulcerative colitis, and a host of other intestinal disorders.

9.Cholesterol is now understood to be a vital anti-oxidant that protects us from free radical damage and helps to heal any arterial damage that may have occurred.

10.Cholesterol is extraordinarily important for babies & children as they develop their brain and nervous system. Over half of the brain is composed of saturated fats and cholesterol. One of the richest sources of cholesterol is mother's milk which also contains a special enzyme that helps the baby metabolize and use this nutrient.

craig-oxley - August 23, 2010 12:22 PM (GMT)

Heart Disease: Understand the Difference between Truth and Myth, Part II

Saturday, August 21, 2010 by: Dr. David Jockers
http://www.naturalnews.com/029532_heart_disease_myths.html

It is known today that cholesterol itself does not cause heart disease. Free radicals that interact with cholesterol molecules cause them to oxidize. It is oxidized cholesterol that causes major problems within the vasculature of the body.

When inflammatory pathways are elevated it decreases the anti-oxidant protection around the cholesterol molecules. Without this protective wall of anti-oxidants the cholesterol molecules are easily oxidized and blood vessels are damaged.

Increasing evidence has revealed that the concentration and size of the LDL particles more powerfully relates to the degree of atherosclerosis progression than the concentration of cholesterol contained within all the LDL particles. One may have very high levels of LDL particles yet still have a low risk of atherosclerosis. This is due to the anti-oxidant protection around the LDL particles.

Pattern A lipid profile consists of larger and more buoyant LDL particles. These larger particles carry a high volume of the antioxidant Vitamin E which helps to fend off free radicals. They pose only a very small chance of being oxidized while traveling through the circulatory system. Due to the anti-oxidant protection this is a very healthy blood lipid panel.
Typical Pattern A lab findings: LDL: Anywhere from low-normal-high
HDL: Normal
Triglycerides: Normal (should be under 70)

Pattern B lipid profile consists of small LDL particles. The particles carry less fat-soluble antioxidants such as Vitamin E. This increases the likelihood of oxidation by free radicals. Due to their lesser size they also pose a major threat of slipping into the endothelial wall. Once they slip into the endothelial wall there is high probability they will become oxidized and damage the vessel. Regardless of the total number of LDL particles this is a very dangerous blood lipid panel.
Typical Pattern B lab findings: LDL: Anywhere from low-normal-high
HDL: Low
Triglycerides: High

Pattern B lipid profile is strongly linked to poor diet and blood sugar control. A diet high in refined fats and sugars and low in anti-oxidants and good fats is the typical culprit.

Trans-fats and high omega 6 fats (vegetable oils and grain-fed meat) cause a rampant increase in prostaglandin E2 and other inflammatory mediators. A diet high in these anti-nutrients causes massive amounts of free radicals to be produced and significant tissue damage to occur.

Healthy fats like the saturated fats common to coconut oil & grass-fed animal products have been shown to increase HDL and enhance Pattern A lipoprotein function.

Additionally, good fats such as EPA/DHA within fish/krill oil and Omega 9 fats common to olive oil, avocados, and almonds play a significant role in lipoprotein function.

Sugar consumption causes a very quick increase in blood sugar. When blood sugar rises quickly the pancreas pumps out massive amounts of insulin to clear the sugar out of the bloodstream. High circulating insulin increases the inflammatory pathways. High insulin also triggers triglyceride and cholesterol formation while draining the system of its anti-oxidant protection.

High Fructose Corn Syrup (HFCS) immediately stimulates lipogenesis (fat generation) by turning into activated glycerol (G-3-P). This provides the very backbone for triglyceride formation. The fatty acids created during fructose metabolism accumulate as fat droplets in your liver and skeletal muscle tissues. Over time this causing insulin resistance and non-alcoholic fatty liver disease (NAFLD).

The metabolism of fructose by your liver creates a long list of waste products, toxins, and free radicals. These free radicals steal anti-oxidants from our system and damage tissues in a process called glycation. Glycation accelerates the aging process and dramatically decreases our overall health and well-being.

Child Cholesterol: Lower without Drugs

Friday, August 13, 2010 by: Derrell Jones
http://www.naturalnews.com/029457_cholesterol_children.html

(NaturalNews) An obesity crisis is gripping our society and unfortunately our children have not been spared from it. It is believed that some 20% of youth today are obese and that obesity brings a host of potential adverse health conditions including high cholesterol. A problem once thought to be a rarity is now prevalent enough to garner the attention of concerned parents and the medical community alike.

The Right Kind of Attention?

The American Academy of Pediatrics has given its approval to prescribe statins to children as young as 8 years old. Parents are finding themselves trying to decide if statins are right for their child. Putting children on statins could lead to many years of exposure to this family of powerful drugs which makes the decision more daunting. But there are obese children out there who have concerned parents who are looking for insight. With the long term safety and efficacy of statins on kids being unknown what should a parent do?

There is a push to medicate as many people as possible for as long as possible. With the prevalence of pharmaceuticals in our society an intense conditioning is well under way. This conditioning is now extending to our children who remain the most vulnerable and will undoubtedly experience frightening side effects from years of prescription drug use leading to the need for more pharmaceuticals. Over 2 million prescriptions were written for children in 2009. With the recent approval of Livalo, a new high potency statin, and a chewable version of Lipitor which was recently approved for use in the United Kingdom, our children are being directly targeted by big pharma. Unfortunately for us and our children not many people in the medical community are advocating for a

natural non-chemical approach to the obesity problem.

A Plan of Action

Obesity in our society and specifically our children tend to be the result of sedentary lifestyles and poor dietary choices. Parents should focus on having their children be more active. Seek advice on increasing your child`s activity level through exercise and extra-curricular functions at school or in the community. Parents should also participate with their children in these activities to serve as motivation and inspiration. Counseling on healthier eating habits is also an effective consideration, especially when combined with increased physical activity, for lowering cholesterol. Start by increasing the amount of fruits and vegetables, preferably organic, that kids eat. A whole foods diet is also recommended with emphasis on eliminating, as much as possible, any artificial sweeteners and chemically altered foods. Again parents should also engage in a healthier eating regime to serve as a positive example for their children to follow. A naturopath or holistic practitioner should be able to properly guide you and your child.

Why Not Statin Drugs?

No parent wants their child to suffer and great care must be taken to ensure the long term health of our children. By encouraging healthy habits like exercise and proper eating our kids long term health can be secured. The promise that pharmaceutical use is the answer to our ills is a fallacy. Just consider the possible side effects of any statin drug: headaches, abdominal cramping, nausea, muscle aches and weakness, difficulty sleeping, diarrhea, and constipation. More serious conditions can occur such as myositis, which is inflammation of the muscles, or myalgias, which are characterized by muscle pain. Both myositis and myalgia can be serious in rare cases.

The side effects of proper nutrition and exercise are a decrease in obesity and a positive increase in healthy, vibrant and active children.

'Give out statins with junk food'

Burgers are loaded with fat

12 August 2010 Last updated at 15:08
http://www.bbc.co.uk/news/health-10955522

Fast food outlets should consider handing out cholesterol-lowering drugs to combat the effects of fatty food, say UK researchers.

Taking a statin pill every day would offset the harm caused by a daily cheeseburger and milkshake, the Imperial College London team said.

It would only cost 5p a customer - similar to a sachet of ketchup.

But the British Heart Foundation warned an unhealthy diet does more harm than just raising cholesterol.

Writing in the American Journal of Cardiology, Dr Darrel Francis and colleagues said it was about reducing harm in the same way that people who smoke are encouraged to use filters and those who drive are told to wear seatbelts.

They took data from trials of almost 43,000 people to calculate whether the statins could override the effects of eating a junk food diet.

A statin a day can neutralise the risk of cardiovascular disease linked to a daily intake of a 7-oz cheeseburger and a small milkshake, they calculated.

The researchers said there could be no substitute for leading a healthy lifestyle, including eating a good diet, but that a complimentary statin would be at least one

positive choice among a sea of negative ones.

For those only eating junk food once a year, an annual one-off statin dose would have little effect, but for those who partake more regularly it would have a greater opportunity to neutralise that risk, they added.

Heart risk

Statins are already taken by millions of Britons to reduce the risk of suffering a heart attack or stroke by lowering levels of bad cholesterol in the blood.

They are thought to be fairly safe, although some experts have raised concerns about side-effects.

One low-dose statin - simvastatin - is available in a low dose to buy from the pharmacist.

"Importantly, even partial adherence to statin therapy conveys a mortality benefit, suggesting that statins do not need to be taken daily to have some protective effect," said Dr Francis.

But he pointed out that statins would not affect all the negative effects of an unhealthy diet.

"It's ironic that people are free to take as many unhealthy condiments in fast food outlets as they like, but statins, which are beneficial to heart health, have to be prescribed," he said.

"It makes sense to make risk-reducing supplements available just as easily as the unhealthy condiments that are provided free of charge."

But Professor Peter Weissberg, medical director at the British Heart Foundation, said the suggestion should not be taken literally.

"A junk food diet has a wealth of unhealthy consequences beyond raising cholesterol.

"It can cause high blood pressure through too much salt, or obesity through eating meals loaded with calories.

He added: "Statins are a vital medicine for people with - or at high risk of developing heart disease.

"They are not a magic bullet."

Niacin Increases Good Cholesterol

Tuesday, August 03, 2010 by: Kerri Knox
http://www.naturalnews.com/029344_niacin_cholesterol.html

In the past decade doctors have declared an all out war on the high cholesterol levels by prescribing cholesterol lowering 'statin' drugs that have dubious safety records. What's not talked about very much, though, is that humans actually NEED cholesterol for good health. Interestingly, there are different types of cholesterol: 'bad' cholesterol that may be an overall contributor to the arterial plaque that doctors are so concerned about, and 'good' cholesterol that is an overall contributor to good health. What's talked about even LESS is the fact that niacin, one of the B complex vitamins, is well known as THE most effective way to improve cholesterol levels by INCREASING cholesterol levels- in a good way.

High Density Lipoproteins, known as HDL's, are the healthy cholesterol particles that are measured as a part of the total cholesterol level. While doctors generally say that high cholesterol levels are 'bad', nearly all health professionals and cholesterol researchers agree that high levels of HDL's are actually quite good and tend to be protective against heart disease, stroke and other chronic illnesses. This fact is not discussed much by the media or by doctors, however, because there is no financial incentive to educate people about HDL cholesterol when the only good ways to raise levels is with diet, exercise- and niacin.

Niacin, also called nicotinic acid and Vitamin B3, is an extremely common and inexpensive over-the-counter B vitamin that is present in small amounts in nearly all multivitamin preparations. In higher doses, however, niacin has been shown to be a formidable weapon in the war to RAISE the right kind of cholesterol. It's so effective that, in a rare harmony of opinion about a natural substance, the Mayo Clinic, the 'New

England Journal of Medicine' and the 'Atherosclerosis Journal' all agree that niacin is, "the most effective drug available for raising HDL cholesterol."

That isn't niacin's only health benefit; it's also been shown to reduce 'bad' cholesterol, thin the blood and improve blood flow to the heart: each of which independently has been shown to be an important part of preventing and even treating heart disease. The short acting over-the-counter supplemental niacin, however, has one significant flaw- while extremely safe, it creates an uncomfortable, but harmless and temporary problem of skin flushing and itching. In answer to this inherent problem with niacin, Big Pharma created a long-acting niacin preparation called Niaspan that, while greatly decreasing the flushing that occurs, actually increases the incidence of liver problems. With a slap in the face to the supplement industry, the less safe drug Niaspan is allowed to make a 'Qualified Health Claim' for reducing cholesterol while the supplement industry is NOT allowed to make the same claim about safer over-the-counter niacin! In any case, even though your doctor isn't likely to tell you about it, niacin is an incredibly safe over-the-counter supplement that has an amazing ability to increase the good HDL cholesterol levels that we all need for good health- just watch out for the flushing.

Keep Your Kid's Cholesterol in Check

From Breakfast to Dinner, These Tips Can Help Keep Your Child Healthy

By BELINDA WALKER
July 12, 2010
http://abcnews.go.com/GMA/OnCall/dr-richar...ory?id=11139963

Should all children be screened for high cholesterol?

That's the suggestion of a study out of West Virginia that found that a family history alone isn't sufficient to catch high cholesterol among children.

In analyzing results from family histories and fasting lipid tests of more than 20,000 West Virginia youngsters, researchers found that 71 percent of them met guidelines for cholesterol screening based on family history.

But it said that a third of children whose cholesterol levels were high enough to merit treatment were being missed by guidelines so dependent upon family history. The study concludes that many youngsters could benefit from universal cholesterol screening that would allow for early diagnosis.

However Dr. Richard Besser, ABC News' senior health and medical editor for ABC News, is cautious of the study. He said the study did not take into account obesity levels and that we should be careful putting young children on medication they may have to use for the rest of their lives.

Besser suggests the emphasis should be on obesity prevention and the promotion of

healthy eating habits and exercise for the whole family since weight loss and exercise is one way to reduce cholesterol without medication.

Tips to Keep Your Kids' Cholesterol Down

"Good Morning America" gathered some good cholesterol wrangling tips from the Centers for Disease Control and Prevention and WebMD:

Make sure you know your family history.

Exercise regularly. According to the CDC, children and adolescents should do 60 minutes (1 hour) or more of physical activity each day.

Make sure your children eat foods low in total fat, saturated fat, trans fat and cholesterol.

Select a variety of foods so your child can get all the nutrients he or she needs.

Breakfast: Fruit, cereal, oatmeal and low-fat yogurt are among the good choices for breakfast foods. Use skim or 1 percent milk rather than whole or 2 percent milk (after age 2, or as recommended by your doctor).

Lunch and Dinner: Increase vegetable consumption and cut back on meats. In fact, you can join the Meatless Monday movement! Cutting meats out of your diet at least one day each week can cut down on your fat intake and will make room for more nutrient-rich vegetables.

Bake or grill foods instead of frying them. Use whole-grain breads and rolls to make a healthier sandwich. Also, give your child whole-grain crackers with soups, chili, and stew. Prepare pasta, beans, rice, fish, skinless poultry or other dishes. Always serve fresh fruit (with the skin) with meals.

Snacks: Fruits, vegetables, breads and cereals make great snacks for children. Children should avoid soda and fruit drinks.

High cholesterol in children may drop naturally on its own over time

Tuesday, July 20, 2010 by: Jonathan Benson
http://www.naturalnews.com/029234_children_cholesterol.html

A new study published in the journal Pediatrics has found that children with high cholesterol may not need drug treatments to bring them back to normal, healthy levels. Children who tested with high cholesterol levels initially in the study eventually had their levels taper off, indicating that the process may occur naturally over time, without the need for drugs.

Researchers explained that cholesterol levels can vary from day to day anyway, and that testing is most accurate when done numerous times. There are "bad" cholesterol days and "good" cholesterol days, and researchers believe that tests showing extremely high levels may be indicative of a bad cholesterol day, and not necessarily high cholesterol levels in general.

"Both in kids and in adults there is quite a bit of variability over time," explained David Freedman from the U.S. Centers for Disease Control and Prevention (CDC). "People with very, very high cholesterol are likely to be those that are having a bad cholesterol day. My paper emphasizes that you probably need at least two or three measurements to screen out kids who are just having a bad day,"

In other words, prescribing children cholesterol medication without doing multiple tests a few months apart may be a mistake, because children who test high on one day might test far lower on another. And children who do have high general levels may experience a drop over time naturally, without the need for drug administration.

The study, which involved more than 6,800 children from Bogalusa, Louisiana, found that after four years, cholesterol levels in children who initially tested high dropped below threshold levels 60 percent of the time.

But even for children whose levels did not drop, experts are unsure whether drug treatment is at all appropriate or helpful for children. Simple exercise and a healthy diet may be enough to maintain healthy cholesterol levels.

"Daily exercise is one of the best and safest ways to control cholesterol levels," explains Dr. Richard DiCenso in his book, Beyond Medicine, Exploring a New Way of Thinking.

View Full Version: Saturated Fat is Not a Health Hazard (Opinion)

Title: Saturated Fat is Not a Health Hazard (Opinion)

craig-oxley - July 24, 2010 02:32 PM (GMT)

Saturated Fat is Not a Health Hazard (Opinion)

Friday, July 16, 2010 by: Helmut Beierbeck
http://www.naturalnews.com/029211_saturated_fat_health.html

You have undoubtedly come across the advice to avoid saturated fat; it is supposed to be bad for your heart because it increases serum cholesterol levels. To lower our risk of cardiovascular disease (CVD) we are encouraged to switch to unsaturated fat from sources like vegetable oils and fish. The trouble with this advice is that total cholesterol is not a good indicator of CVD risk; the ratio of HDL ("good cholesterol") to LDL ("bad cholesterol") has greater predictive value. Saturated fat consumption raises both LDL and HDL levels, and the HDL increase largely compensates for the LDL increase.

The advice to avoid saturated fat is given with great confidence but there is surprisingly little evidence to back that recommendation; epidemiological studies of a link between fat consumption and heart disease have given mixed results in the past. A 2001 review article (1) identified just two studies that found a significant positive association between saturated fat intake and risk of coronary heart disease (CHD), and only one trial that showed a significant inverse association between polyunsaturated fat intake and CHD; these findings could not be confirmed by other investigators.

In an attempt to try and settle this matter, a meta-analysis of earlier studies of the connection between saturated fat and heart disease was undertaken (2). Twenty-one relevant articles were identified which yielded data from nearly 350,000 participants following anywhere from five to 23 years. The authors' conclusions? Saturated fat does not cause heart disease:

"A meta-analysis of prospective epidemiologic studies showed that there is no significant evidence for concluding that dietary saturated fat is associated with an

increased risk of CHD or CVD. More data are needed to elucidate whether CVD risks are likely to be influenced by the specific nutrients used to replace saturated fat."

The difference between saturated and unsaturated fats is actually not as great as these two terms imply; each type is made up of both saturated and unsaturated fatty acids, albeit in different proportions (3). Unsaturated fats (oils) typically contain 10% - 20% saturated fatty acids. The 'saturated fats' butter and lard, on the other hand, contain only about 60% and 40% saturated fatty acids, respectively; the rest is mainly monounsaturated fatty acids. Clearly, the term 'saturated fat' is misleading.

The fatty acid mix in butter and lard also happens to be quite close to the fatty acid composition in healthy human tissues; one half of the fatty acids in cell membrane phospholipids are saturated. We also make both saturated and unsaturated fatty acids from non-lipid precursors - palmitic and stearic acids and their omega-7 and omega-9 derivatives. It is therefore difficult to see why saturated fat should be a health hazard.

Of course we need a certain amount of unsaturated fats - not because they are healthier than saturated fat but because they are the best sources of essential fatty acids. But there is no epidemiological support for the claim that saturated fat is bad for us, nor is there any plausible biochemical reason why this should be so.

Description: *challenge [ITS ALL ABOUT THE BUCK!!]*

craig-oxley - June 30, 2010 12:34 PM (GMT)

AstraZeneca shares up after winning US court challenge

The firm's anti-cholesterol drug is now protected until 2016

Page last updated at 09:21 GMT, Wednesday, 30 June 2010 10:21 UK
http://news.bbc.co.uk/1/hi/business/10457805.stm

Shares in drug company AstraZeneca have risen after the firm's US court victory to protect a patent on big-selling cholesterol drug Crestor.

Winning its three-year battle means cheaper, generic, versions of the drug can not enter the US market until 2016.

In London, AstraZeneca shares were up nearly 10%, or 285.50p, at 3232.50p.

The US District Court in Delaware said the Crestor patent was "valid and enforceable" after a challenge by nine generic drugs manufacturers in 2007.
'Removes risk'

Crestor generated $2.1bn (£1.4bn) in US sales last year.

"The court's decision reaffirms the strength of the intellectual property protecting Crestor," said AstraZeneca chief executive David Brennan.

Industry observers had believed AstraZeneca would win the case.

However, the verdict came as a relief to the firm, given that billions of dollars were at stake.

Some analysts estimate that as much as 80% of a branded drug's sales vanish when faced with generic competition.

"Yesterday's ruling removes a major risk, given that Crestor is by far the company's most important product in terms of potentially achieving the top end of the 2014 guidance range and returning to sustainable growth after this point," said Citigroup analyst Kevin Wilson.

View Full Version: Big Pharma lies about statin drugs finally exposed

Title: Big Pharma lies about statin drugs finally exposed
Description: *in British Medical Journal*

craig-oxley - June 14, 2010 03:46 PM (GMT)

Big Pharma lies about statin drugs finally exposed in British Medical Journal

Monday, June 14, 2010
by Mike Adams
http://www.naturalnews.com/028988_statin_d...de_effects.html

To hear Big Pharma tell it, statin drugs are "miracle" medicines that have prevented millions of heart attacks and strokes. But a recent study published in the British Medical Journal tells a completely different story: For every heart attack prevented by the drug, two or more people suffered liver damage, kidney failure, cataracts or extreme muscle weakness as a result of taking the drug.

Statin drugs, in other words, harm far more people than they help.

Julia Hippisley-Cox and Carol Coupland led the study which examined data from over two million patients, including over 225,000 patients who were new statin drug users.

They found that for every 10,000 women being treated with statins, there were only 271 fewer cases of heart disease.

And yet, at the same time, the statin drugs caused 74 cases of liver damage, 23 cases of acute kidney failure, 39 cases of extreme muscle weakness and 307 cases of cataracts.

Statin drugs, in other words, helped 271 people but harmed 443 people. This demonstrates how they are wreaking havoc with the health of those who take them, causing damage that far outweighs any benefit they might offer.

Big Pharma's highly deceptive advertising implies that statin drugs help everyone who takes them. So if 10,000 people took the drugs, we're promised, heart attacks would be prevented in all 10,000 people. That's the implied message in the drug ads, anyway.

But this is just a wild exaggeration and distortion of the facts. Most drugs don't work on most people, and statin drugs only "work" on about 2.7% of those who take them. Yet they cause serious damage in about 4.4% of those who take them.

So if you take statin drugs, your odds of benefiting from them is less than 3 out of 100. But your odds of being harmed by them are more than 4 out of 100. For 96 out of 100 people, statin drugs do nothing except make the drug companies rich and pollute the waterways every time you flush the toilet.

Statin drugs, then, are basically a crap shoot with your health.

Keep the pharma profits rolling
From the point of view of Big Pharma, they have the added benefit of causing other diseases that often result in yet more drugs or medical procedures being prescribed. Kidney dialysis makes big money for hospitals, by the way. It's a multi-billion-dollar business all by itself. Statin drugs are therefore a way for the sick-care industry to recruit new patients into kidney dialysis, knowing that some percentage of statin drug users are going to end up with full-blown kidney failure.

What's really interesting about all this is how easy it is to fool doctors into prescribing statin drugs. Doctors mistakenly think these are miracle drugs, but they're never read the research. They've been convinced by drug reps, misleading medical journal articles and Big Pharma advertising -- and they bought it!

Mainstream doctors, you see, are perhaps the most gullible people on the planet. They'll gladly prescribe a drug that harms more people than it helps -- by the millions -- because they can be almost effortlessly swayed into pushing poison pills through "science babble" language used by drug companies to promote their pills.

Doctors are literally walking around today thinking statin drugs are such miracle lifesavers that some doctors openly talked about dripping the drug into the public water supply! That's how convinced they are about the drug's benefits. They think everyone should be taking statins whether they need them or not!

It's downright loony. But that's characteristic of western medicine, isn't it? Proclaim your poison to be "miracle medicine" while utterly ignoring the truth that those drugs harm far more people than they help (and they simply don't work on more than 90% of people who take them).

The statin scam
Statin drugs are a scam, plain and simple, and the doctors who prescribe them are

puppets used by Big Pharma to sell high-profit drugs to people who for the most part won't even benefit from them. That this research exposing the truth about statin drugs even appeared in the British Medical Journal is a minor miracle all by itself, by the way. But it does indicate that the wall of lies constructed about statins by Big Pharma is starting to crack.

If the truth about statins were openly known, the drugs wouldn't be prescribed to anyone, and drug companies would be sued for billions of dollars for their false advertising and marketing manipulations.

Until that happens, just remember this: Any doctor who recommends a statin drug is a con man drug pusher. If they don't have the honesty to research the truth about these drugs and stop prescribing them, they certainly cannot be trusted with your health. If they're pushing statin drugs on you, they're really just working for Big Pharma, not for you, and they're not interested in real science and the real impacts of drugs on patients.

It brings up another hugely important question in modern medicine: Why don't doctors have the capability to question the false beliefs of their own industry? As you might have guessed, that's the topic of another story altogether.

View Full Version: Brain regulates cholesterol in blood

Title: Brain regulates cholesterol in blood

craig-oxley - June 7, 2010 10:49 AM (GMT)

Stick to concentrating on the Liver and one herb that is a must and works for sure is Artichoke, I've proved it. -Craig

Brain regulates cholesterol in blood, study suggests

Page last updated at 16:12 GMT, Sunday, 6 June 2010 17:12 UK
By Emma Wilkinson
Health reporter, BBC News
http://news.bbc.co.uk/1/hi/health/10241715.stm

The amount of cholesterol circulating in the bloodstream is partly regulated by the brain, a study in mice suggests.

It counters assumptions that levels are solely controlled by what we eat and by cholesterol production in the liver.

The US study in Nature Neuroscience found that a hunger hormone in the brain acts as the "remote control" for cholesterol travelling round the body.

Too much cholesterol causes hardened fatty arteries, raising the risk of a heart attack.

The research carried out by a US team at the University of Cincinnati found that increased levels of the hunger hormone ghrelin in mice caused the animals to develop higher levels of blood-circulating cholesterol.
Continue reading the main story

This could potentially open up new forms of treatment to control cholesterol levels, which would be great news for people with heart and circulation problems
Fotini Rozakeas
British Heart Foundation

Levels in the blood rise because signals from the brain prompt the liver to store less cholesterol, the researchers said.

It is known that ghrelin inhibits a receptor in the brain in its role in regulating food intake and energy use.

In a separate experiment, they found that blocking this receptor in mice also increased levels of cholesterol in the blood.
Potential treatment

The researchers said the finding needs to be replicated in humans but potentially opens up a new way of treating high cholesterol.

Study leader Professor Matthias Tschoep said: "We have long thought that cholesterol is exclusively regulated through dietary absorption or synthesis and secretion by the liver.

"Our study shows for the first time that cholesterol is also under direct 'remote control' by specific neurocircuitry in the central nervous system."

Fotini Rozakeas, cardiac nurse at British Heart Foundation, said: "This interesting study on mice shows for the first time that blood cholesterol levels can be directly controlled by signals transmitted from the brain to the liver where cholesterol is formed.

"This could potentially open up new forms of treatment to control cholesterol levels, which would be great news for people with heart and circulation problems."

She stressed that much more research would be needed before the mechanisms at play were fully understood.

"In the meantime, people should reduce the amount of saturated fat in their diet, take part in regular physical activity and, in some cases, take prescribed medicines such as statins, to keep their cholesterol levels under control."

craig-oxley - May 21, 2010 12:01 PM (GMT)

'Unintended' statin side-effect risks uncovered

Statins lower cholesterol

Thursday, 20 May 2010 00:02 UKE-mail this to a friend Printable version
http://news.bbc.co.uk/1/hi/health/8695102.stm

GPs should think more carefully about prescribing cholesterol-busting drugs say researchers who highlighted a range of "unintended" side effects.

Some doses and types of statins are linked with a greater risk of adverse effects, including liver problems and kidney failure, the UK research showed.

Doctors will have access to a computer program based on the findings to help spot those most at risk.

Millions of UK adults take the drugs to reduce heart attack and stroke risk.

The researchers, from the University of Nottingham, stressed that for many people the benefits of statins outweighed any adverse effects, but the findings would help weigh up the pros and cons in each patient.
For people with, or at high risk of heart disease, the benefits of statins far outweigh this risk
June Davison, British Heart Foundation

There are plans to prescribe statins on the NHS in around one in four adults aged over 40.

The Department of Health had predicted prescriptions for the drugs would rise by 30% a year, as GPs find more and more people eligible.

At the moment, anyone judged to have a one in five or greater risk of developing cardiovascular disease over 10 years is advised to take a statin.

But there has been much debate over side effects and the latest research set out to confirm where the problems may lie in a "real life" population.

Unintended effects

Researchers looked at data from more than two million 30-84 year-olds from GP practices in England and Wales over a six-year period.

Adverse effects identified in the study, published in the British Medical Journal, include liver problems, acute kidney failure, muscle weakness and cataracts.

For kidney failure and liver dysfunction, higher doses of the drugs seemed to be associated with greater risk.

Risks of side-effects were greatest in the first year of use.

On the positive side, the analysis also showed no significant association between the use of statins and the risk of Parkinson's disease, rheumatoid arthritis, blood clot, dementia, osteoporotic fracture, or many cancers including gastric, colon, lung, renal, breast or prostate.

Study leader Professor Julia Hippisley-Cox, who also works as a GP, said the computer programme they had devised meant GPs could work out which patients were most at risk of side-effects and whether their risk of heart disease was high enough to warrant them taking statins.

"People should be able to make an informed choice," she said.

"There are risks and benefits to all medicines, but if you have a patient at higher risk than average of something serious you might want to warn them to come back if they have problems."

June Davison, cardiac nurse at the British Heart Foundation, said: "We already know that a small number of people taking statins experience unwanted side effects.

"However, for people with, or at high risk of heart disease, the benefits of statins far outweigh this risk.

"Anybody experiencing side effects while taking statins should speak to their doctor."

RISKS OF STATINS
For every 10,000 women treated with statins:
271 fewer cases of cardiovascular disease
8 fewer cases of oesophageal cancer
23 extra patients with acute kidney failure
73 extra patients with liver dysfunction
307 extra patients with cataracts
39 extra patients with muscle weakness
Figures were similar for men, except there would be 110 extra cases of muscle weakness

Title: MORE GREAT STUFF FROM RAVNSKOV
Description: *NEW BOOK AND UPDATED MATERIAL!!!*

AntiSionist - May 20, 2010 08:07 PM (GMT)

http://www.fathead-movie.com/index.php/201...e-good-for-you/

QUOTE

As in his previous book, Dr. Ravnskov describes what cholesterol actually is and takes us on a tour of the "science" that identified it as the villain in heart disease. Using two of my favorite tools — logic and math — he simply shreds the Lipid Hypothesis, often using the proponents' own data against them. In fact, that was one of the major revelations for me when I read The Cholesterol Myths: not just that the Lipid Hypothesis is wrong, but how much manipulation and flat-out dishonesty have gone into supporting it, from Ancel Keys on down. The lipophobes fell in love with their theory and simply aren't willing to let it go. How else do you explain the theory's longevity when Dr. Ravnskov — and anyone else who cares to look — can dig up the facts he cites in this book:

Thirty years after the start of the Framingham project, the researchers again asked themselves what had happened. This time, a few more of those with high cholesterol had died. I use the word "few" for a reason: On average, one percent of all men with high cholesterol had died during the 30 follow-up years.

Now to the interesting point. For men above age 47, their cholesterol made no difference. Those who had high cholesterol at age 48 lived just as long or longer as those with low cholesterol … I have never met any supporter of the cholesterol campaign who has ever raised an eyebrow when confronted with this astounding fact.

[Marmot] demonstrated that is was not the food that raised the cholesterol of the Japanese immigrants, nor high cholesterol that increased their risk of heart disease. He found that if they maintained their cultural traditions, they were proteted against heart attacks, even though their cholesterol increased as much as in Japanese immigrants who adoped a Western Lifestyle and died from heart attacks almost as often as native-born Americans … immigrants who became accustomed to the American way of life but preferred lean Japanese food had coronary disease twice as often at those who maintained Japanese traditions but preferred high-fat American food. Thus, instead of supporting the diet-heart hypothesis, the Japanese study in fact showed that high-fat food is better than low-fat.

In the elderly, high cholesterol even seems to be protective. This was the surprising finding of Dr. Harlan Krumholz and his co-workers at Yale. They followed about 1000 elderly men and women living in the Bronx, NY. During a four year period, about twice as many of those with low cholesterol had a heart attack or died from one, compared to those with the highest cholesterol.

At a workshop held at the National Heart, Lung and Blood Institute, researchers looked at every single

study about the risk of having high or low cholesterol and came to the same conclusion: Mortality was higher for women with low cholesterol than for women with high cholesterol.

[In Finland] one-half of about 1200 more or less overweight male business executives with high cholesterol and high blood pressure were advised about smoking, exercise, weight reduction and diet; the other half were used as a control group. If cholesterol or blood pressure in the control group did not become normal, they were also treated with various blood pressure and cholesterol-lowering drugs. The experimenters were quite happy with the effects of their efforts on risk factors. But the improved risk factors did not lead to better end results: In the group that exercised, reduced their weight, ate less animal fat and more vegetable oil and quit smoking, there were twice as many heart attacks as in the control group.

Another finding that should cause some discomfort among proponents is that whereas high cholesterol is a risk factor in American men, it is not for men living in Canada. This conclusion was reached by Dr. Gilles Dagenais and his team in Quebec after having followed almost 5000 healthy middle-aged for 12 years. They explained away their results by assuming that more than 12 years were needed to see the harmful effects of high cholesterol.

Ah yes, explaining away the results we don't like. As I learned from Dr. Ravnskov's first book, it's taken a lot "explaining" to keep this bogus theory alive. It's also taken a lot of badly designed studies: comparing cholesterol levels and heart-disease rates without adjusting the data for smokers versus non-smokers (smoking raises your cholesterol), or without adjusting for age differences (cholesterol tends to go up as we age, and most heart attacks occur among the elderly). As Dr. Ravnskov explains, when you properly adjust the data, the only conclusion you can reach from some of these studies is that smoking is a bad idea … but we already knew that.

I'm not going to say this book is a simple read, because it isn't. It's not as scientifically dense as Good Calories, Bad Calories, but Dr. Ravnskov shreds the Lipid Hypothesis by applying critical thinking to the studies that claimed to support it, and he invites his readers to think critically as well. He explains — clearly — the scientific method that scientists are supposed to embrace, and walks us through clinical-research concepts such as randomizing a study population, limiting the variables, double-blinding, and distinguishing between an association and a cause.

(As you may recall, in a recent post I borrowed his chart showing an association between high tax rates and heart disease. Have any of the health authorities suggested lowering taxes to reduce heart disease? Should we oppose the new health-care taxes on the grounds that more people will suffer heart attacks?)

As a kid who liked science, I assumed scientific research was a wide-open quest for truth, with the best theories bubbling up to the top. I know better now, thanks in part to reading Dr. Ravnskov's works. In addition to the manipulation of data he spells out, there's a huge amount of selection bias in the health and nutrition field. Badly-designed studies that support the Lipid Hypothesis are 10 to 20 times more likely to cited in journals and academic papers than well-designed studies that dispute it.

Dr. Ravnskov's letters and papers critical of the Lipid Hypothesis have been turned down by medical journals over and over, often with some ridiculous explanations. (I'm on the email list for THINCS, the International Network of Cholesterol Skeptics, and I've read quite a few other letters from members that were sent to medical journals but never published.)

Why the bias? I'm sure you can guess. Follow the money.

Large, well-controlled studies are expensive, so much of the funding comes from pharmaceutical companies that sell statins. They run the studies, they gather the results, and they crunch the numbers. If they don't like the numbers, they crunch them again. As Dr. Ravnskov discovered, they'll even divide subjects into "subgroups" after the fact to produce statistics they like. And of course, they also provide a lot of revenue for the major medical journals.

The other 800-pound gorillas of funding for heart-disease research are two organizations that fully support the Lipid Hypothesis: the National Heart, Lung and Blood Institute and the American Heart Association. As Dr. Ravnskov says, “Researchers critical of the diet-heart idea have little chance of obtaining financial support.” Or as Dr. Mary Eades put it to me: “They live by their grants. No grants, no work, no job.”

To give you an idea of just how militantly these organizations protect the Lipid Hypothesis, consider this fact from the Framingham Study: After 30 years, the data showed that those whose cholesterol dropped as they aged ran a greater risk of dying than those whose cholesterol increased. Specifically, for each 1% drop in cholesterol, there was an 11% increase in total and coronary mortality.

Still with me? Good. Now here’s how the NHLBI and AHA reported the findings:

The results of the Framingham study indicate that a 1% drop of cholesterol corresponds to a 2% reduction in CHD risk.

That must’ve been some very interesting number-crunching.

As you might expect, Dr. Ravnskov is highly critical of statins. He notes that they do appear to reduce heart disease (very slightly) in a small fraction of the population — middle-aged men who have existing heart disease — but cites some interesting statistics to suggest that they also produce cancer. And data from the pharmaceutical companies’ own research indicates that they don’t do diddly for people who don’t have heart disease but are merely “afflicted” with high cholesterol.

Think about that for a moment. Millions of people are prescribed statins simply because their cholesterol is above some magic threshold: 200, or 220. Doctors aren’t treating heart disease; they’re treating a cholesterol score. And in the process, they’re prescribing a drug that can also produce muscle weakness, memory problems, susceptibility to infections, sexual dysfunction and perhaps cancer.

It’s infections that Dr. Ravnskov covers in the last part of the book. Far from being the villain we’ve been led to believe, Dr. Ravnskov believes LDL fights infections. A century ago, when infections killed more people than heart disease, people with high cholesterol — even those with the genetic disorder that leads to very high cholesterol — lived the longest on average. In fact, Dr. Ravnskov proposes a new hypothesis (which he fully admits is just a hypothesis) for heart disease in this book: plaques begin as the result of microbial infections.

Briefly as I can summarize it, the theory goes like this: LDL is part of the immune system and attacks infections. If the structure of the LDL is changed after attacking a microbe, it will in turn be treated as a foreign substance and swallowed up and oxidized by macrophages — white blood cells within tissues — producing the inflammation that’s common in heart disease. If the immune system works well, the infection is destroyed and HDL carries away the oxidized LDL.

However, if the immune system is weak, too many of the oxidized LDL particles clump together and become stuck in the capillaries that feed the coronary arteries. Part of the arterial wall dies, and something like a boil is formed — what Dr. Ravnskov calls a vulnerable plaque. If the plaque bursts, a clot can obstruct the artery. Now you’ve got a heart attack on your hands.

Again, it’s just a theory, although Ravnskov cites a lot of evidence to support it. Up to half of all heart-attack victims, for example, have recently had an infection of some kind. Either way, it makes a lot more sense than the notion that our bodies are stupid and produce so much cholesterol, it ends up clogging our arteries.

If you’re interested in the science — good and bad — behind fats, cholesterol and heart disease, I urge you to get a copy of this book. (No, I’m not getting a commission.) Better yet, buy a copy

for yourself and another one for your doctor. Perhaps you can prevent a few needless prescriptions for Lipitor.

http://www.modern-diets-and-nutritional-di...osclerosis.html

QUOTE

Why Clogged Arteries
Arteriosclerosis

Arteriosclerosis may be caused by excessive levels of homocysteine, which is the normal breakdown product of the amino acid methionine. High levels of homocysteine can damage artery walls. The walls become hardened containing calcium deposits called plaque. Arteries containing plague are more disposed to become atherosclerotic.

The normal metabolic breakdown of homocysteine is disrupted when amounts of vitamins B6, B12, and folic acid are inadequate. Some say high homocysteine levels are better correlated with atherosclerosis and heart disease than cholesterol.

The cholesterol page (URL http://www.modern-diets-and-nutritional-di...holesterol.html)can contribute to a better understanding of the importance of cholesterol.

Linus Pauling, a two time Nobel prize winner, showed that cholesterol is the bodies answer to atherosclerosis in the absence of adequate amounts of ascorbic acid (vitamin C). Sixty milligrams , the current MDR, is not enough vitamin C. The body needs 8-12 grams a day. This, of course,is disputed by mainstream medicine and the pharmaceutical industry.

Malcolm Kendrick M.D., a Scottish physician, obtained data from the WHO MONICA study of many nations that did not show cholesterol as a cause of heart disease. From the same study he showed that saturated fat actually protected against death from heart disease. Eight countries that ate the lowest amount of saturated fat had higher death from coronary heart disease than all eight countries that ate the most saturated fat.

Atherosclerosis

Atherosclerosis is an advanced form of arteriosclerosis characterized by deposits of cholesterol, fats, and blood clots that form within the plaque. This results in roughened raised areas in arteries that can disrupt blood flow. Atherosclerosis and high blood pressure increase with age.

Atherosclerosis is said to be the cause of coronary heart disease (CHD). Anything that obstructs the flow of blood in coronary arteries may produce heart disease.

Studies of the hearts of people who have died of coronary heart disease reveal that about a fifth of those who died did not have obstructed coronary arteries. The arrested blood flow in such cases may have been due to a spasm of a coronary artery that obstructed the blood flow.

Another possibility is a clot formation that dissolved before death. Dr. Ravnskov says the cause of death may not be known in such cases.

A coronary artery may become completely clogged and yet never give any symptoms such as angina, or pain. The reason is that fine branches of the main coronary arteries have branches that communicate with each other.

If the arterial occlusion occurs slowly enough the communicating branches slowly widen enough to take care of adequate blood flow. That is collateral, or alternative, circulation may develop.

A heart attack may occur even though the coronary arteries are perfectly normal, and coronary heart disease may be absent even when coronary arteries are completely blocked.

Dr. Ravnskov maintains that arteriosclerosis, and subsequently atherosclerosis, and coronary heart disease are separate conditions. Problem is many researchers have confused our thinking by regarding them as the same thing.

View Full Version: An Underactive Thyroid may be Cause of Your High

Title: An Underactive Thyroid may be Cause of Your High
Description: *Cholesterol*

craig-oxley - May 19, 2010 11:19 AM (GMT)

An Underactive Thyroid may be Cause of Your High Cholesterol

Wednesday, May 19, 2010 by: Deanna Dean
http://www.naturalnews.com/028816_thyroid_...holesterol.html

An estimated 98 million American adults have high cholesterol or total blood cholesterol values of 200 mg/dL or higher. Your doctor may be following the clarion call, insisting you take a statin drug to lower these levels. Both you and your doctor may not be aware that hypothyroidism, according to the National Cholesterol Education Program, is a common secondary cause, after diet, associated with high cholesterol.

The Mayo Clinic concurs with medical experts that, "hypothyroidism may also be associated with an increased risk of heart disease, primarily because high levels of low-density lipoprotein (LDL) cholesterol - the "bad" cholesterol - can occur in people with an underactive thyroid. It is not unusual when low thyroid function is addressed, cholesterol will often return to normal levels."

Hypothyroidism is a condition where too little thyroid hormone is in the bloodstream, and yet of the more than 13 million Americans who have a thyroid disorder, nearly half have been undiagnosed.

"The thyroid gland produces hormones that regulate the body's metabolism. If the thyroid gland produces too little hormone, metabolism can slow, having a direct impact on the body's ability to clear cholesterol from the bloodstream. As a result, the risk of cholesterol being deposited in the arteries, especially around the heart, is increased, thereby increasing the risk for heart disease."
Even if your thyroid is under active, and not true hypothyroidism, there can be an increase in total cholesterol levels, in addition to an impairment of your heart's ability to

pump efficiently. Hypothyroidism can also lead to an enlarged heart and heart failure.

Tests from the University of Texas-Southwest Medical School, Dallas, TX underscore a clear correlation between hypothyroidism and hypercholesterolemia, (high blood cholesterol.) Ninety percent of patients with overt hypothyroidism have increased cholesterol and/or triglycerides. Once hypothyroidism is treated with a thyroid hormone replacement, and the TSH level is restored to normal, the majority of patients show an estimated 20 to 30 percent reduction in cholesterol levels.

While research shows thyroid stimulating hormones have a positive relationship on cholesterol, the effects of subclinical hypothyroidism on cardiovascular disease are nonetheless under debate. However, most current data suggest that even modest thyroid-stimulating hormone elevations result in improved lipid profiles. Even with adequate treatment of a thyroid condition, there may still be other reasons for your cholesterol to remain above normal, such as diet and genetic factors.

- Meet with your doctor and request a TSH (thyroid stimulating hormone) blood test, along with T4, T3, Free T4 and Free T3 tests.

- At most labs in the U.S., the normal range is from around .3 to 3 as of early 2003. If the TSH level is at the higher end of the range, or above the range, your doctor may determine that you are hypothyroid (underactive thyroid.) If you are diagnosed with hypothyroidism, here are some natural supplements to improve your thyroid health.

Iodine -- You can increase your iodine intake through diet and kelp supplementation. Kelp is rich in iodine. Foods that contain iodine are yogurt, eggs, fish and other seafood, radish, parsley, potatoes, oatmeal and bananas.

Selenium -- Many people diagnosed with hypothyroidism were found to be selenium deficient. Selenium deficiency can reduce the activity of the thyroid hormones.

Tyrosine -- Tyrosine is an amino acid needed by the body to manufacture thyroid hormones from iodine.

Thyroid Glandular -- Thyroid glandular supplements are usually sold through your practitioner.

Bladderwrack -- Bladderwrack is a seaweed that is a rich source of iodine that is thought to stimulate the thyroid gland increasing metabolism.

If you have high cholesterol, have your doctor check your thyroid before taking drugs.

Your healthmate,
Deanna Dean

View Full Version: Vitamin B3 beats Big Pharma's Zetia cholesterol

Title: Vitamin B3 beats Big Pharma's Zetia cholesterol
Description: *drug [STICK WITH ARTICHOKE!]*

craig-oxley - April 18, 2010 03:14 PM (GMT)

Vitamin B3 beats Big Pharma's Zetia cholesterol drug

Tuesday, March 30, 2010
http://www.naturalnews.com/028473_Zetia_Vitamin_B3.html

The utter worthlessness of Big Pharma's cholesterol drugs was demonstrated recently by a study published in the New England Journal of Medicine which showed that niacin (a low-cost B vitamin) out-performs Merck's drug Zetia for preventing the build-up of arterial plaque, a symptom of cardiovascular disease.

As the study reveals, Zetia failed miserably. Patients taking niacin showed a "significant shrinkage" in artery wall thickness, while those on Zetia showed no such improvement. At the same time, the rate of "cardiovascular events" in the niacin group was only one-fifth that in the Zetia group, demonstrating that niacin is far more effective at preventing heart attacks and other similar events than Zetia.

But curiously, as soon as niacin started to show a real benefit over Zetia, researchers cancelled the study. The premature ending of the clinical trial stopped the process by which even more useful information about the benefits of niacin might have been learned.

5,800% higher price than niacin
Merck, the maker of Zetia, was likely horrified to learn that a low-cost B vitamin out-performed its blockbuster drug. Sales of its Zetia drug are reportedly over $5 billion. It's no wonder: Zetia sells for as much as $3.89 per pill.

Niacin, on the other hand, costs as little as 6.7 cents per pill, even in a "no-flush" time-release formula from a quality source like the NSI brand from Vitacost: http://www.

vitacost.com/NSI-No-Flus..

These price differences make Zetia 5,800% more expensive than niacin. And yet niacin works better.

So if niacin works better, and if modern medicine claims to be serving patients instead of profits, why don't doctors recommend B vitamins instead of expensive cholesterol drugs? As you have already guessed, the reason is because Zetia earns all kinds of ridiculous profits for Big Pharma and B vitamins don't.

The fact that doctors continue to prescribe Zetia, in fact, demonstrates how thoroughly our modern medical system has failed to recognize and embrace things that work to help patients rather than things that make the most money for powerful drug companies. If our modern system were actually based on what works, doctors would be prescribing various vitamins, minerals, herbs, superfoods and nutritional supplements (including anti-cancer mushroms).

But no... our system isn't based on what helps patients. It's based on what makes the most money, and so patients are put on dangerous (even deadly) pharmaceuticals that can cost 5,800% more than low-cost natural remedies that actually work better!

The big question: Does modern medicine help society at all?
It really makes you wonder: Beyond emergency treatments and critical care, does modern medicine offer any net benefit to society at all? More and more people are now coming to the conclusion that no, modern medicine harms far more people than it helps.

The key question to ask is this: What if our medical system disappeared tomorrow? Would we be better off or worse off?

The startling (but true) answer is that we would be better off. Without cancer screening, for example, breast cancer rates would plummet (because screening causes cancer). Without cholesterol drugs, blood pressure drugs, diabetes drugs and chemotherapy, people would live far longer, with less liver damage, kidney damage and brain damage.

In all, pharmaceuticals do not save lives. They destroy lives while making huge profits for drug companies. And yet much of western medicine is based on the administration of these dangerous, over-priced chemicals.

There's a fascinating book entitled What if Medicine Disappeared? by Gerald Markle and Frances McCrea. (http://www.amazon.com/What-Medicine...)

This book explains why modern medicine does far more harm than good. It doesn't explain, however, why doctors who think they're so smart continue to prescribe a patented medication that's 5,800% more expensive than a nutritional solution that works better.

View Full Version: Does Cholesterol Really Matter?

Title: Does Cholesterol Really Matter?

craig-oxley - March 19, 2010 04:46 PM (GMT)

Does Cholesterol Really Matter?

Monday, March 15, 2010 by: Dr. Julian Whitaker
http://www.naturalnews.com/028380_cholesterol_health.html

I'd like to shine the spotlight on one of medicine's sacred cows- the belief that lowering cholesterol with drugs protects against heart attacks and premature death. Our obsession with cholesterol began in the 1950s when studies linked high consumption of animal fat with high rates of heart disease. This opened the door for clinical trials that laid the foundation of a new paradigm: the cholesterol theory of cardiovascular disease.

This theory has had profound ramifications. It changed the way we eat (fats bad, carbohydrates good) and contributed to our problems with obesity and diabetes. It wormed its way into "clinical practice guidelines"- cholesterol management has become a "standard of care" that doctors are expected to follow. It spawned the invasive heart surgery industry, based on the presumption that cholesterol-laden blockages must be bypassed or propped open. And it led to the creation of the best-selling class of medications in history: cholesterol-lowering statin drugs, which generate more than $15 billion in worldwide sales every year.

But it's all a house of cards. No matter what you've been led to believe, a high cholesterol level is not a reliable sign of an impending heart attack. In fact, growing numbers of experts question whether cholesterol matters at all. As for statin drugs, for most of the 40-plus million Americans recommended to take them for the rest of their lives, they're an ineffective, expensive, side effect- riddled fraud.

Statin-Free Zone
When a patient taking Lipitor, Zocor, or another statin drug comes to Whitaker Wellness, we discontinue it at once. "But my cholesterol level is 240." "My doctor told me I'll have a heart attack if I don't take this drug."My father died of heart disease, so I

have to take it." I've heard all these justifications and more, and I still recommend that my patients get off statins. Here's why.

First, they're not very effective. These drugs do lower cholesterol, but so what? We're not treating lab numbers. We're treating patients, and the ultimate goal in cholesterol management is to reduce risk of cardiovascular disease. Except for a very limited number of people, there is absolutely no evidence that statins protect against heart attack or premature death.

Are you over age 65? Not a single study suggests you'll receive any benefits, even if your cholesterol goes down substantially. A woman of any age? Same story. A man younger than 65 who has never had a heart attack? Ditto, no help at all. For middle-aged men who have had a heart attack, statins may lower risk of a repeat heart attack, but that's the extent of it.

I know this is hard to buy in light of the multiple drug advertisements and glowing endorsements from doctors. But keep in mind that pharmaceutical companies do a superb job of pulling the wool over the eyes of consumers and physicians alike by withholding unfavorable study results and making false, misleading, and often deceptive claims.

A Statistic We Can Understand
That's why I want to step around confusing statistics and tell you about an easy-to-understand measure that you'll never hear about in drug ads. It's called "number needed to treat," or NNT, and it describes the number of patients who would need to be treated with a medical therapy in order to prevent one bad outcome. Experts consider an NNT over 50 to be "worse than a lottery ticket."

Lipitor ads claim that it reduces risk of heart attack by 36 percent. Sounds pretty good until you look at the fine print, do the math (which John Carey did in a great article in Business Week), and figure out that the drug's NNT is 100. This means that 100 people must be treated with Lipitor in order for just one heart attack to be prevented. The other 99 people taking the drug receive no benefit.

To put this into perspective, the NNT of antibiotics for treating H. pylori, the underlying cause of stomach ulcers, is 1.1. These drugs knock out the bacteria in 10 out of 11 people who take it, making them a reliable, cost-effective therapy. At the other end of the spectrum are statins, which as a class have an NNT of 250, 500, or higher depending on the study you look at. What a deal for drugs that can cost more than a thousand bucks a year and are almost guaranteed to cause problems.

Goodbye Drugs, So Long Symptoms
Statins lower cholesterol by suppressing the activity of an enzyme in the liver involved in the production of cholesterol. But this enzyme has multiple functions, including the

synthesis of coenzyme Q10. CoQ10 is a key player in the metabolic processes that energize our cells. No wonder statin users often suffer from fatigue, muscle pain and weakness, and even heart failure- the cells are simply running out of juice.

The second most frequent adverse effects of statins are problems with memory, mood, suicidal behavior, and neurological issues. Other common complaints include sexual dysfunction, and liver and digestive problems. Symptoms range from minor (achiness, forgetfulness) to serious (complete but temporary amnesia, permanent memory loss) to lethal (congestive heart failure, rhabdomyolysis or complete muscle breakdown). One statin drug, Baycol, was taken off the market a few years ago after it caused dozens of deaths from rhabdomyolysis. Several studies have also linked statin drugs with an increased risk of cancer.

Because physicians rarely warn of these side effects, few patients suspect their drugs may be the reason they begin feeling bad- and it's often a revelation when they put two and two together. Simply discontinuing these medications can result in tremendous improvements in health and well-being. Texas cardiologist Peter Langsjoen, MD, published a study showing that when symptomatic patients got off their statins and started taking 240 mg of CoQ10 per day, they had significant decreases in fatigue, myalgias (muscle aches), dyspnea (shortness of breath), memory loss, and/or peripheral neuropathy.

Not a Drug But a Program
As you can see, we need to shift away from this myopic focus on statin drugs and lowering cholesterol, and take a more holistic view. Folks, you don't need statins- you need a program that addresses all the known risk factors for heart attack, stroke, and other cardiovascular disorders.

Inflammation, not high cholesterol, is the primary cause of heart disease. Harvard researchers have discovered that a high blood level of C-reactive protein, a marker of inflammation, is more predictive of heart disease than cholesterol. To get a handle on inflammation, lose weight- especially if you carry excess fat in the abdominal area. Exercise. Stop smoking. Eat plenty of vegetables and several weekly servings of salmon, sardines, and other omega-3 fatty acids, and avoid sugars and starches.

The beauty of this program is that it targets not only inflammation but other conditions that contribute to cardiovascular disease, including high blood pressure, diabetes, even cholesterol. Best of all, it's a foundation for overall good health.

Necessary Nutrients
Your program should include a well-rounded nutritional supplement regimen, as well. My number-one suggestion for inflammation in all its guises is fish oil. This supplement also improves blood flow, discourages excess clotting, helps normalize heart rhythm, and saves lives by reducing risk of sudden cardiac death.

Folic acid and other B-complex vitamins are important because they lower levels of homocysteine, a toxic substance that damages the arteries. The mineral magnesium relaxes the arterial walls, which improves blood flow, lowers blood pressure, and helps prevent arrhythmias. And antioxidants, such as vitamins C and E, provide protection against damaging free radicals- another contributor to cardiovascular disease.

Supplements that boost the heart's energy are recommended as well. One is coenzyme Q10. In addition to serving as a potent antioxidant, CoQ10 also increases the heart muscle's efficiency and protects against the adverse effects of statin drugs. Another is D-ribose, a natural sugar that is the structural backbone of adenosine triphosphate (ATP), the energy that fuels cellular function.

Don't Fret About Cholesterol
As far as cholesterol lowering is concerned, there are a number of natural therapies that work well, including flaxseed and other sources of fiber, niacin, plant sterols, and policosanol.

In short, do what you can to manage your cholesterol, but don't worry about it if your level is particularly stubborn. The average cholesterol of people who have heart disease isn't much higher than the level of those who don't. If high cholesterol runs in your family, concentrate on what you can control, and remember, numbers aren't everything.

Recommendations:
*
Here are suggested daily doses of the supplements discussed above: fish oil 2-8 g, folic acid 800-1,200 mcg, magnesium 500-1,000 mg, vitamins C 1,000-5,000 mg, and E 400-800 IU, CoQ10 100-400 mg, D-ribose 10-15 g, flaxseed 1/4 cup, niacin 500-2,000 mg, plant sterols 1,500-2,000 mg, and policosanol 20 mg. Look for these supplements in your health food store or order them by calling (800) 810-6655.

* Discuss this information with your doctor. If you are interested in learning about the protocol we use at the Whitaker Wellness Institute to prevent and treat heart disease, visit whitakerwellness.com or call (800) 488-1500. To locate a physician in your area familiar with drug-free therapies, visit acamnet.org.

Title: Agenda 21 in New York State - Home Rule and
Description: *Article X*

TheUnhivedMind - July 11, 2011 11:07 PM (GMT)

Agenda 21 in New York State - Home Rule and Article X

Totalitarian Collectivism
http://www.batr.org/totalitariancollectivism/071011.html

Article 2 - GENERAL POWERS OF LOCAL GOVERNMENTS TO ADOPT AND AMEND LOCAL LAWS; RESTRICTIONS
10 - General powers of local governments to adopt and amend local laws.
11 - Restrictions on the adoption of local laws.
New York Code - Laws: Municipal Home Rule

Agenda 21 in New York State - Home Rule and Article X

Numerous critics condemn the insidious nature of Agenda 21. Usually the arguments are based upon the intrusion of the United Nations to mismanage the planet and reduce people to a sinister petri dish experiment. Their reach and methods used by this octopus that is strangling the globe, include specific actions that force their agenda down the throats of government entities. The recent passage of Article X in New York State illustrates a direct assault on the treasured principle of Home Rule. Connecting the dots and tying the links together forecast a grim reality that is ready to explode into a vicious turf fight.
The United Nations publication for Sustainable Development describes their objectives and announcements.

Agenda 21 is a comprehensive plan of action to be taken globally, nationally and locally by organizations of the United Nations System, Governments, and Major Groups in every area in which human impacts on the environment.

Agenda 21, the Rio Declaration on Environment and Development, and the Statement of principles for the Sustainable Management of Forests were adopted by more than 178 Governments at the United Nations Conference on Environment and Development (UNCED) held in Rio de Janerio, Brazil, 3 to 14 June 1992.

The Commission on Sustainable Development (CSD) was created in December 1992 to ensure effective follow-up of UNCED, to monitor and report on implementation of the agreements at the local, national, regional and international levels. It was agreed that a five year review of Earth Summit progress would be made in 1997 by the United Nations General Assembly meeting in special session.

The full implementation of Agenda 21, the Programme for Further Implementation of Agenda 21 and the Commitments to the Rio principles, were strongly reaffirmed at the World Summit on Sustainable Development (WSSD) held in Johannesburg, South Africa from 26 August to 4 September 2002.

<object style="height: 390px; width: 640px"><param name="movie" value="http://www.youtube.com/v/xGGYkYlSKQg?version=3"><param name="allowFullScreen" value="true"><param name="allowScriptAccess" value="always"><embed src="http://www.youtube.com/v/xGGYkYlSKQg?version=3" type="application/x-shockwave-flash" allowfullscreen="true" allowScriptAccess="always" width="640" height="390"></object>[/dohtml]

The video Agenda 21 For Dummies is an excellent background overview.

New York State is a "Home Rule" jurisdiction, dating back to 1923. New York Municipal Home Rule - Article 2 - § 10 General Powers of Local Governments to Adopt and Amend Local Laws, provides the authority for the cherished prerogative of communities to control their destinies. The stark conflict of local self-determination and the arbitrary imposition of bureaucratic fiats outlined in Agenda 21 are self-evident. Under the guise of streamlining energy siting and land use, New York State has jumped to the tune of the globalist marching band orders. In the darkness of midnight in a closed room, the new governor Andrew Cuomo pushed a secret version of Article X, and the legislature voted approval for the Power NY Act.
NY Senator Patricia Ritchie’s opposition explains the violation on Home Rule. Assembly representative Sean Hanna's passionate argument against this attempt to diminish Home Rule, echoes the sentiment. But, when it comes to lining the pockets of the latest

robber barons, the role of corporatist power broker law firms, like Albany's Whiteman Osterman & Hanna LLP, is quite evident.

The new Article X also makes provision for post decision challenges and imposes procedural and substantive limits on potential claims. The bill prohibits the use of intervenor funds for litigation purposes. It also provides that aggrieved parties must seek rehearing at the Siting Board before approaching the courts. Judicial challenges must be brought in the courts of the Appellate Division, bypassing the trial court level, within 30 days from the issuance of the Board's decision on the application for rehearing. The bill also provides for deferential review under the "substantial evidence" standard. Finally, the new law largely divests the state courts of jurisdiction to determine any cases that seek to stop or delay construction of a generation facility that has received a certificate from the Siting Board.
The video of developer Ecogen's Testimony before the NYS Public Service Commission clearly demonstrate how citizen participation is surgically removed from the rush to rape the land and bury the serfs under the cover of a green canopy. This example of a bogus Agenda 21 corporate welfare scheme to defraud the public and feed the greed of foreign plutocrats stands squarely against the property rights of individuals and local communities. The Wind Power Law Blog identifies salient elements in the legislation.

The famous (or infamous depending on one's point of view) Article X, which provided for the streamlined siting of power plants, expired in 2003. The old Article X covered plants with 80MW or more of generational capacity. The new law should permit much faster siting of power plants of only 25MW or greater capacity. It passed both the Assembly and Senate with overwhelming margins.

Governor Cuomo styles the new law as "An Investment to Create More Power in New York"

Streamline the permitting process for power plants greater than 25 megawatts by creating a "one-stop" multi-agency siting board that will make siting decisions

Empower communities to participate in the process by requiring power plant applicants to provide "intervenor funding" for the community affected by the proposed plant to hire experts and lawyers

Improve the environment and public health by requiring the siting board to determine whether a proposed facility will create a disproportionate environmental impact in a community and, if so, requires applicant to minimize or avoid those impacts
The Community Environmental Legal Defense Fund recognizes the inherent conflict in fast tracking unbridled and reckless land development exploration for inefficient energy projects.

We believe that we are in the midst of an escalating ecological crisis, and that the crisis is the result of decisions made by a relatively few people who run corporations and government. In doing so, communities must challenge and overturn legal doctrines that have been concocted to eliminate their right to self-government, including the doctrines of corporate constitutional rights, preemption, and limitations on local legislative authority. Inseparable from the right to local self-government - and its sole limitation - are the rights of human and natural communities; they are the implicit and enumerated premises on which local self-government must be built.

Title: Breast-Cancer Patients Under 40 May Keep Fertility
Description: *With Drug [HOW KIND! QUACK FILTH!]*

TheUnhivedMind - July 21, 2011 12:27 AM (GMT)

Breast-Cancer Patients Under 40 May Keep Fertility With Drug, Study Finds

By Charles Mead - Jul 19, 2011 9:00 PM GMT+0100
http://www.bloomberg.com/news/2011-07-19/b...tudy-finds.html

Younger women with early-stage breast cancer who took a drug to suppress their ovaries were more likely to avert early menopause caused by chemotherapy, researchers found.

The treatment, triptorelin, helped patients avoid the permanent loss of their fertility that can be prompted by chemotherapy's toxic doses, according to research published today in the Journal of the American Medical Association.

Two out of every five women under 40 who undergo chemotherapy for breast cancer lose the ability to conceive children, the researchers said. The use of triptorelin reduced the rate of early menopause by more than 17 percentage points, according to the results of a late-stage clinical trial called Promise-GIM6.

"Because the prevention of early menopause is the essential condition for fertility maintenance, women may more easily accept chemotherapy," Lucia Del Mastro, an oncologist at the National Institute for Cancer Research in Genoa, Italy, and the study's lead author, said by e-mail. "This strategy increases the probability of ovarian function maintenance but it doesn't assure the fertility."

Triptorelin may stave off menopause and increase the probability of staying fertile by reducing levels of the hormone that stimulates the ovaries. Because chemotherapy targets areas with "rapid cellular turnover," ovaries that are rendered dormant with the drug may be protected, Del Mastro said.

Reproductive Life

Doctors diagnose almost 25,000 women younger than 45 with breast cancer every year, wrote Hope Rugo and Mitchell Rosen of the University of California, San Francisco, in an accompanying editorial. Each month of chemotherapy cuts reproductive life by more than a year, the researchers said. Concern that infertility may occur influences treatment decisions in more than a quarter of all cases, the researchers found.

“Young survivors of breast cancer consider premature menopause, sexual dysfunction, and infertility the most distressing aspects of their cancer experience,” they wrote.

The triptorelin strategy could be combined with procedures such as freezing an embryo to further increase the chances that a woman facing chemotherapy may have a child afterward, Del Mastro said.

The scientists evaluated 260 patients in the trial, which began in 2003. Almost 26 percent of the women who received only chemotherapy had early menopause, compared with 7.9 percent of the group receiving both chemotherapy and triptorelin, the researchers found.

About 25 percent of patients treated only with chemotherapy got back some function of their ovaries, compared with 29 percent in the triptorelin group. So far, one woman who was treated with only chemotherapy became pregnant, compared with three who took the drug.

The triptorelin used in the study was supplied by French drugmaker Ipsen SA. (IPN) The Italian National Institute for Cancer Research funded the trial.

View Full Version: Defect in Sperm Cloaking Protein May Explain

Title: Defect in Sperm Cloaking Protein May Explain
Description: *Puzzling Male Infertility [PUZZLING? NOT*

TheUnhivedMind - July 21, 2011 12:26 AM (GMT)

Defect in Sperm Cloaking Protein May Explain Puzzling Male Infertility

By Elizabeth Lopatto - Jul 20, 2011 7:01 PM GMT+0100
http://www.bloomberg.com/news/2011-07-20/d...nfertility.html

Infertile men may have a gene defect that takes away a protein that cloaks and protects sperm against a woman's immune system while traveling to the egg, according to a study that offers a new explanation for some male infertility.

Although the sperm from men with the gene variant look normal under a microscope, they are less able to move through a solution made to resemble human cervical mucus, researchers reported today in Science Translational Medicine. When the cloaking protein was added to the sperm, they regained their swimming abilities, the study found.

About 10 percent of women of childbearing age have difficulty getting pregnant, and one in three cases involves male infertility, according to the National Institutes of Health. In another third of cases, the cause of infertility isn't known. The discovery announced today may aid in those cases, the authors of the study wrote.

"This is the kind of discovery that makes scientists almost giddy with excitement," said Charles Bevins, the study author and a microbiologist at the University of California, Davis, said today during a conference call.

When scientists tried to clone the cloaking protein from the sperm in lab studies, they noticed the mutation, Bevins said. The mutation was so significant that no protein was made. Also, it was a gene involved in reproductive success, where mutations usually aren't seen.
Earlier Treatment

In about 70 percent of infertile men, the sperm count and quality don't explain the infertility, said Gary Cherr, the paper's senior author and a professor at the University of California, Davis. Knowing the cause of infertility may lead to earlier treatment, allowing patients to bypass expensive testing.

"We envision a clinical or home kit for detecting the presence or absence" of the gene, Cherr said.

About 50 percent of men worldwide carry one defective copy of the gene, called DEFB126, according to the report. These men can still form normal sperm. Another 25 percent carry two defective copies and produce sperm that are poor at swimming through mucus.

By diagnosing the problem early, doctors can avoid certain tests and switch to a fertility treatment that involves directly implanting the sperm into an egg.

In a study cited by the report, 500 couples in China showed that birth rates were 30 percent lower among those in which the husband had two copies of the gene than among those with men who had one or no mutations.

"The mutated gene reduced the rate of contraception, so it took them longer to achieve a pregnancy," said Scott Venners, another study author, and epidemiologist at Simon Fraser University in Burnaby, Canada, during today's conference call.
Concept

The mutation doesn't make it impossible for men to produce viable sperm. Men with two mutated genes but otherwise healthy sperm may very well impregnate their partner without help, said Cherr. However, if these men have lower sperm counts, or less mobile sperm, the gene defect may have "a dramatic impact."

Human sperm is of poorer quality than some primate cousins because humans tend to mate in a longer-term way than, for instance, rhesus monkeys, where multiple males pair with a female during one ovulation, said Ted Tollner, a study author and an adjunct assistant professor of obstetrics and gynecology at the University of California, Davis. That may be why the mutation hasn't disappeared, he said.

Also, there may be some advantage to having one mutated gene and one normal one, Bevins said. Further research may include seeing if the mutation changes anything in women.

View Full Version: Birth control coverage proposed for most health

Title: Birth control coverage proposed for most health
Description: *insurance plans*

TheUnhivedMind - July 20, 2011 04:02 AM (GMT)

Birth control coverage proposed for most health insurance plans

By N.C. Aizenman, Published: July 19
http://www.washingtonpost.com/national/hea...ry.html?hpid=z4

Virtually all health insurance plans could soon be required to offer female patients free coverage of prescription birth control, breast-pump rentals, counseling for domestic violence, and annual wellness exams and HIV tests as a result of recommendations released Tuesday by an independent advisory panel of health experts.

The health-care law adopted last year directed the Obama administration to draw up a list of preventive services for women that all new health plans must cover without deductibles or co-payments. While the guidelines suggested Tuesday by a committee of the National Academy of Sciences' Institute of Medicine are not binding, the panel conducted its year-long review at the request of Health and Human Services Secretary Kathleen Sebelius.

In a statement, Sebelius praised the committee's work as "historic" and "based on science and existing literature."

"We are reviewing the report closely and will release the department's recommendations .•.•. very soon," she added.

Although generally expected, the committee's decision to put "the full range" of Food and Drug Administration-approved contraceptives and sterilization procedures on its proposed list ignited immediate controversy.

Jeanne Monahan, director of the Center for Human Dignity at the socially conservative Family Research Council, said that many Americans may object to birth control on

religious grounds. “They should not be forced to have to pay into insurance plans that violate their consciences. Their conscience rights should be protected,” she said.

Just as troubling, said Monahan, was the inclusion of emergency contraceptives such as the so-called morning-after pill sold as Plan B and the more recently approved drug sold as Ella. Both primarily work by inhibiting ovaries from releasing eggs. But antiabortion advocates argue that there is evidence the drugs can also prevent an already-fertilized egg from implanting in the womb, which they consider equivalent to abortion.

Adam Sonfield, a public policy expert at the Guttmacher Institute, a nonprofit research center, countered that the scientific basis for such claims is highly questionable and that in any case, the medical field defines pregnancy as beginning with the implantation, not the fertilization, of an egg.

“They are purposely trying to confuse the American public about what contraception is and to try to tar it as abortion because .•.•. in truth they are not just antiabortion, they are anti-contraception,” he said. “And they know the American public overwhelmingly supports contraception.”

For instance, Sonfield said, a Guttmacher study found that 98 percent of sexually active Catholic women and nearly 100 percent of evangelicals have used contraception at some point, compared to 99 percent of women overall.

Other research by Guttmacher suggests that those with health insurance are already very likely to get some degree of birth-control coverage from their health plans. This is at least partly because of a recent surge in state laws mandating such coverage as well as a federal law that, since 2000, officials have interpreted to require employers to include contraception if they pay for other preventive services and prescription drugs. In 1998, Congress also added a birth-control coverage requirement to health plans for federal employees.

Still, none of these mandates require plans to cover contraception without co-pays or other forms of cost-sharing. And there is evidence that the out-of-pocket cost may discourage many women from using birth control as consistently as they would like: About half of all pregnancies are unplanned, according to Guttmacher.

The rules on preventive services for women complement a broader provision in the new health-care law that already requires plans to offer free preventive care for men, women and children from lists drafted by other panels of independent scientific experts, most prominently the U.S. Preventive Services Task Force.

However, because that task force has historically paid less attention to gender-specific recommendations, the law’s drafters added a requirement that the Department of

Health and Human Services issue a supplementary list for women.

Women's health advocates pronounced themselves delighted that the Institute of Medicine committee had chosen to recommend not only the widest possible range of contraceptive services but also an expansive spectrum of other preventive services.

These include screening for gestational diabetes in pregnant women; more sophisticated testing for a virus, known as HPV, that is associated with cervical cancer; annual counseling for sexually active women on sexually transmitted infections; and multiple visits to obtain preventive services if they cannot be provided in one annual exam.

"We're very pleased about the scope of these recommendations," said Judy Waxman of the National Women's Law Center. "Assuming HHS adopts them I expect a big impact on women's health."

Insurers will need to follow the new guidelines at the start of the next plan year within one year after Sebelius issues them.

The administration estimates that 41 million Americans are in "new" employer or individual plans to which the rules will apply. An additional 98 million people are covered by "grandfathered" policies exempt from the new rules. But such plans can lose grandfathered status if they make a host of changes to their coverage and payment policies. So their number is expected to dwindle rapidly in coming years, such that by 2013, 47 million more Americans will be in employer plans covered by the new rules.

The guidelines will also largely apply to plans covering federal employees, but not to Medicare, Medicaid or TriCare. Medicaid and TriCare already offer contraceptive coverage, with Medicaid offering it at no cost.

TheUnhivedMind - July 20, 2011 01:09 AM (GMT)

THE QUIET COUP: The implementation of Agenda 21

July 18, 2011 by ppjg
http://ppjg.wordpress.com/2011/07/18/the-q...n-of-agenda-21/
Debbie Coffey /Investigative Reporter/PPJ

More importantly, above this description is the OBJECTIVE, which is “the encouragement of communally and collectively owned and managed land.”

People have noticed the 25 government agencies on Obama’s new White House Rural Council. And, they’re questioning what might be the need for all of them.

What people may not have noticed yet, is that the government agencies in this council are also on other councils. These councils, as well as the individual government agencies, are implementing international laws that have taken effect through Executive Orders, Memorandums of Understanding, agreements and regulations that most Americans don’t even know about. These have bypassed Congress. And, it also seems they have completely bypassed the Constitution.

The devil is in the details

These agencies and councils are forming “partnerships” with members and groups other than the American people. However, our tax dollars pay for their salaries and for the programs.

Some “partnerships” sound innocuous, but as you might guess, the devil is in the details.

I’ll give you an example. There is a BioEco Working Group (www.bioeco.gov), which at first glance seems to be part of the Department of Interior’s U.S.Geological Survey, since it is listed as creating the website. But the actual Charter has National Science and Technology Council in the heading. (The National Science and Technology Council includes 20 of the same agencies that are on the new Rural Council, but with some additional agencies, including the CIA. It also includes the Vice-President, Cabinet Secretaries, heads of Agencies and some White House officials.)

Participating agencies in the BioEco Working Group are the Depts. of Agriculture, Defense, Energy, State, EPA, NASA, U.S. Fish and Wildlife Service (Dept. of the Interior), U.S. Geological Survey (Dept. of the Interior), Department of Health and Human Services, National Institutes of Health, National Oceanographic and Atmospheric Administration, National Science Foundation, and the Smithsonian Institution. It seems BioEco also wanted to solicit the membership of the National Archives and Records Administration and U.S. AID.

In the Appendix of the Charter, signed in 2008 by Ann Bartuska of the U.S. Forest Service (under the U.S. Dept. of Agriculture) and Susan Haseltine of the U.S. Geological Survey (under the U.S. Dept. of the Interior), it states activities of this work group are to:

“Provide a focal point for coordinating U.S. biodiversity and ecosystem informatics activities with international efforts and organizations in this and related areas (such as the Global Biodiversity Information Facility (GBIF), the Global Earth Observation System of Systems (GEOSS), the Consortium for the Barcode of Life (CBOL), and the Encyclopedia of Life (EoL), to ensure compatability of standards and approaches, facilitate sharing of technologies, and provide for equity/reciprocity in data access and exchange.”

You might think, “this is nice, we’re sharing information with everybody.” Then you might notice that these organizations seem to map land and catalog biological resources.

On the website of the Global Biodiversity Information Facility (GBIF), which is an international organization with “many partners,” the GBIF’s Memorandum of Understanding (with its participants), Paragraph 3, states Objectives:

“Purpose

The purpose of GBIF is to promote, co-ordinate, design and implement the compilation, linking, standardisation, digitisation and global dissemination of the world’s biodiversity

data, within an appropriate framework for property rights and due attribution.

Co-operation and Co-ordination

The Participants intend to encourage co-operation amongst themselves in the implementation of GBIF and in the development of joint work programmes in areas of mutual interest with the Secretariat of the Convention on Biological Diversity and other appropriate bodies and initiatives…"

Wait a sec, our U.S. Senate didn't ratify the treaty for the Convention of Biological Diversity (which means the U.S. Senate didn't formally approve of or vote for the U.S. to be part of the Convention on Biological Diversity). So now all of these U.S. agencies are encouraging each other to develop "programmes" that the Secretariat of the Convention on Biological Diversity is interested in? Wouldn't that be…the Convention on Biological Diversity?

If the same U.S. agencies that have agreed to encourage each other are on the new White House Rural Council, are these agencies going to encourage each other to develop and implement the Convention on Biological Diversity in the Rural Council meetings, too?

The Convention on Biological Diversity (CBD)

This is an internationally binding treaty and was presented for signature at the Earth Summit at Rio de Janeiro in 1992. Sounds like the treaty should be about biological diversity, doesn't it?

If you read the text of the treaty, you'll find out that if there's a "dispute" that isn't resolved between two parties, the State or organization has to settle it in the International Court of Justice, or in a three person arbitral tribunal, where each party gets one arbitrator and the third arbitrator, the President of the Tribunal, is to be from an entirely different nation.

The CBD website states that this treaty was "Conceived as a practical tool for translating the principles of Agenda 21 into reality."

The United Nations' Agenda 21

If you look at the United Nation's Agenda 21 (Section 1, 7.28 and 7.29), you see why the BioEco Working Group might be mapping land and creating an inventory of biological resources: "All countries should consider, as appropriate, undertaking a comprehensive national inventory of their land resources in order to establish a land information system in which land resources will be classified according to their most appropriate uses and environmentally fragile or disaster-prone areas will be identified for special protection measures."

(Who will decide the most “appropriate” use of our land? The United Nations?)

More importantly, above this description is the OBJECTIVE, which is “the encouragement of communally and collectively owned and managed land.”

Cassandra Anderson of www.morphcity.com pointed out that collectivism is a “Political philosophy where a small group determines the “greater good” for the masses. While it could take the form of communism, fascism, socialism, etc, the common denominator is control over the population.”

Although the White House Rural Council might seem to be about helping our rural communities, it’s more likely going to be about letting international interests help themselves to our rural communities.

AUTHOR’S NOTE: The Bureau of Land Management is removing our wild horses from their federally protected Herd Management Areas, then leasing the same land for $2 an acre for oil and gas lease sales, or permitting new mining and mining expansions to foreign owned companies. I think the wild horses are like the canary in the coal mine. As go these American icons that stand as symbols of our freedom, so goes our freedom.

Brain-damaged woman 'would not want to live'

By Fergus Walsh
19 July 2011 Last updated at 15:01
http://www.bbc.co.uk/news/health-14205607

The sister of a severely brain-damaged woman has told a judge that she would not have wanted to live a life totally dependent on others.

The Court of Protection is hearing an application that feeding tubes be withdrawn from the 51-year-old woman known only as M.

M, who is lives in a care home in the north of England, suffered brain damage in 2003 after a viral infection.

She is in what is known as a minimally conscious state.

The court heard that M receives "exceptional and dedicated" treatment at the care home.

The family lawyer said they were here because of the clearly and consistently expressed views of M, who was not religious, that she would never want to live a life dependent on others, even if she retained her mental faculties.

The family are asking a judge at the Court of Protection to allow M to die through the withdrawal of artificial nutrition and hydration.

The official solicitor, who opposes the application, said he was satisfied that M's mother, sister and partner love her a great deal and they genuinely believe they are

acting in her best interests.

M's sister wept as she told the court that she missed her very much. She described how, prior to her illness, M had been a very active woman.

She said M had been fiercely independent.

"I know in my heart she would not want to live like that" she said.

"What can she possibly get out of life? She can't move, speak and she's fed through a tube. She can't even enjoy a cup of tea.

"She has no pleasure in life. There's no dignity in it. It's not a life, it's an existence and I know she would not want that."

When told that care staff think that M can communicate by opening her eyes she said it was not anything meaningful.

The hearing is being seen as a test case.

In 1993, the House of Lords ruled that doctors need not keep someone alive if it was viewed that it was of no benefit to the patient. That case involved Tony Bland, a survivor of the Hillsborough football disaster, who was in a persistent vegetative state or PVS.

Patients in PVS have no awareness or consciousness of their surroundings.

But the key difference here is that M is not in a vegetative state but is minimally conscious. Although she is unable to talk, it will be for the court to establish whether she is able to communicate in any meaningful way.

A crucial point for the family is that they believe M is suffering and experiences pain.

The case continues.

Russia’s Medvedev Signs New Law Regulating Abortion

Friday, July 15th, 2011 at 7:45 pm UTC
http://blogs.voanews.com/breaking-news/201...ating-abortion/

Russian President Dmitry Medvedev has signed a new law that restricts abortion in the country for the first time since the fall of communism.

Until now, abortion has been mostly unrestricted in Russia.

But the law signed by Mr. Medvedev on Thursday was seen by some as possibly the first in a series of restrictions on the practice in Russia, which has one of the highest abortion rates in the world. Russian authorities say abortion has contributed to the country's declining population, now about 143 million people, down nearly six million since the fall of the Soviet Union two decades ago.

Russian officials say the new law is aimed at protecting the health of women. The changes require abortion providers to devote 10 percent of any advertising to warn potential clients of the possible health hazards of the procedure.

Russia has a liberal abortion policy, allowing the free procedure at any licensed medical clinic in the country. But the policy has come under attack from right-to-life conservatives and the Russian Orthodox Church.

Russia currently reports more deaths than births each year. Mr. Medvedev has made the fight against Russia's falling birthrate and plunging population one of the key goals of his presidency.

The New York Times reports that Mr. Medvedev's wife, Svetlana Medvedeva, has also

taken up the cause. She is trying to reduce the number of abortions by starting a “Give Me Life!” campaign with brochures and an Internet site to promote a “week against abortion.”

A 2004 United Nations survey showed Russia with the highest abortion rate in the world with 53.7 per 100 women. The rate may have declined in recent years, but the country's health ministry recorded nearly 1.3 million abortions in 2009.

Doorstep lectures on travelling without your car as army of advisers teach families about 'sustainable travel'

By Steve Doughty
Last updated at 9:19 AM on 18th July 2011
http://www.dailymail.co.uk/news/article-20...elling-car.html

Hundreds of thousands of families are to be visited by travel advisers who will tell them to stop driving their cars.

Armed with bus timetables and cycle route maps, they will knock on doors and lecture on the need for ‘sustainable travel’.

The doorstep campaign by the army of taxpayer-funded ‘personal travel advisers’ is part of a £156million effort by ministers to persuade people to leave their cars at home when they go to work or the shops, or take children to school.

Of 39 councils who will share the ‘sustainable transport’ money, 32 have said they will use some of it for advising individuals on how they can get around without their car.

About 300,000 families are liable to get a visit.

Darlington has already run trials using paid advisers to go door to door. It will now get £375,000 for a scheme to visit all 45,900 homes in the area.

In Hereford, the 74,282 homes in the city will be visited twice, once for advisers to give information on public transport and cycling, and three months later to check whether the advice is being followed.

Blackpool has offered its residents a questionnaire on the way they travel, which asks for personal details, information about journeys made, and asks questions such as 'what prevents you from cycling?' and 'do you know where your nearest bus stop is?'

Ministers have told MPs that the spending is good value for taxpayers.

Liberal Democrat Transport Minister Norman Baker said in a statement to MPs that the money will 'support authorities in delivering local economic growth while cutting carbon emissions from transport.'

He added: 'The Department is confident that the overall package of proposals included in this first round represents high value for money.'

John O'Connell of the TaxPayers' Alliance said: 'Schemes like these represent poor value for money for taxpayers. They don't address the real issues facing commuters on congested roads or packed trains.

'With tighter budgets, silly schemes should be consigned to the scrapyard.'

On the streets of Darlington last week travel advisers said they were meeting mixed success. With trolleys full of pamphlets in tow, Alex Clarke, 21, and Chris Chance, 28, who were on contract for the council, said some members of the public were more receptive than others.

Mr Chance said: 'Some people we've spoken to have never considered using any other form of transport than a car.

Eugenics experiments that were carried out in past was in the msm briefly, where victims in North Carolina were 'compensated'. A victim of this heinous crime is interviewed.

American Policy Center » Agenda 21 In One Easy Lesson
Agenda 21 In One Easy Lesson

Awareness of Agenda 21 and Sustainable Development is racing across the nation as citizens in community after community are learning what their city planners are actually up to. As awareness grows, I am receiving more and more calls for tools to help activists fight back. Many complain that elected officials just won't read detailed reports or watch long videos. "Can you give us something that is quick, and easy to read that we can hand out," I'm asked.

So here it is. A one page, quick description of Agenda 21 that fits on one page. I've also included for the back side of your hand out a list of quotes for the perpetrators of Agenda 21 that should back up my brief descriptions.

A word of caution, use this as a starter kit, but do not allow it to be your only knowledge

of this very complex subject. To kill it you have to know the facts. Research, know your details; discover the NGO players in your community; identify who is victimized by the policies and recruit them to your fight; and then kill Agenda 21. That's how it must be done. The information below is only your first step. Happy hunting.

What is Sustainable Development?

According to its authors, the objective of sustainable development is to integrate economic, social and environmental policies in order to achieve reduced consumption, social equity, and the preservation and restoration of biodiversity. Sustainablists insist that every societal decision be based on environmental impact, focusing on three components; global land use, global education, and global population control and reduction.

Social Equity (Social injustice)

Social justice is described as the right and opportunity of all people "to benefit equally from the resources afforded us by society and the environment." Redistribution of wealth. Private property is a social injustice since not everyone can build wealth from it. National sovereignty is a social injustice. Universal health care is a social injustice. All part of Agenda 21 policy.

Economic Prosperity

Public Private Partnerships (PPP). Special dealings between government and certain, chosen corporations which get tax breaks, grants and the government's power of Eminent Domain to implement sustainable policy. Government-sanctioned monopolies.

Local Sustainable Development policies

Smart Growth, Wildlands Project, Resilient Cities, Regional Visioning Projects, STAR Sustainable Communities, Green jobs, Green Building Codes, "Going Green," Alternative Energy, Local Visioning, facilitators, regional planning, historic preservation, conservation easements, development rights, sustainable farming, comprehensive planning, growth management, consensus.

Who is behind it?

ICLEI – Local Governments for Sustainability (formally, International Council for Local Environmental Initiatives). Communities pay ICLEI dues to provide "local" community plans, software, training, etc. Addition groups include American Planning Council, The Renaissance Planning Group, International City/ County Management Group, aided by US Mayors Conference, National Governors Association, National League of Cities, National Association of County Administrators and many more private organizations and official government agencies. Foundation and government grants drive the process.

Where did it originate?

The term Sustainable Development was first introduced to the world in the pages a 1987 report (Our Common Future) produced by the United Nations World Commission on Environmental and Development, authored by Gro Harlem Brundtland, VP of the World Socialist Party. The term was first offered as official UN policy in 1992, in a document called UN Sustainable Development Agenda 21, issued at the UN's Earth Summit, today referred to simply as Agenda 21.

What gives Agenda 21 Ruling Authority?

More than 178 nations adopted Agenda 21 as official policy during a signing ceremony at the Earth Summit. US president George H.W. Bush signed the document for the US. In signing, each nation pledge to adopt the goals of Agenda 21. In 1995, President Bill Clinton, in compliance with Agenda 21, signed Executive Order #12858 to create the President's Council on Sustainable Development in order to "harmonize" US environmental policy with UN directives as outlined in Agenda 21. The EO directed all agencies of the Federal Government to work with state and local community governments in a joint effort "reinvent" government using the guidelines outlined in Agenda 21. As a result, with the assistance of groups like ICLEI, Sustainable Development is now emerging as government policy in every town, county and state in the nation.

Revealing Quotes From the Planners

"Agenda 21 proposes an array of actions which are intended to be implemented by EVERY person on Earth…it calls for specific changes in the activities of ALL people… Effective execution of Agenda 21 will REQUIRE a profound reorientation of ALL humans, unlike anything the world has ever experienced… " Agenda 21: The Earth Summit Strategy to Save Our Planet (Earthpress, 1993). Emphases – DR

Urgent to implement – but we don't know what it is!

"The realities of life on our planet dictate that continued economic development as we know it cannot be sustained…Sustainable development, therefore is a program of action for local and global economic reform – a program that has yet to be fully defined." The Local Agenda 21 Planning Guide, published by ICLEI, 1996.

"No one fully understands how or even, if, sustainable development can be achieved; however, there is growing consensus that it must be accomplished at the local level if it is ever to be achieved on a global basis." The Local Agenda 21 Planning Guide, published by ICLEI, 1996.

Agenda 21 and Private Property

"Land…cannot be treated as an ordinary asset, controlled by individuals and subject to the pressures and inefficiencies of the market. Private land ownership is also a principal instrument of accumulation and concentration of wealth, therefore contributes to social injustice." From the report from the 1976 UN's Habitat I Conference.

"Private land use decisions are often driven by strong economic incentives that result in several ecological and aesthetic consequences…The key to overcoming it is through public policy…" Report from the President's Council on Sustainable Development, page 112.

"Current lifestyles and consumption patterns of the affluent middle class – involving high meat intake, use of fossil fuels, appliances, home and work air conditioning, and suburban housing are not sustainable." Maurice Strong, Secretary General of the UN's Earth Summit, 1992.

Reinvention of Government

"We need a new collaborative decision process that leads to better decisions, more rapid change, and more sensible use of human, natural and financial resources in achieving our goals." Report from the President's Council on Sustainable Development

"Individual rights will have to take a back seat to the collective." Harvey Ruvin, Vice Chairman, ICLEI. The Wildlands Project

"We must make this place an insecure and inhospitable place for Capitalists and their projects – we must reclaim the roads and plowed lands, halt dam construction, tear down existing dams, free shackled rivers and return to wilderness millions of tens of millions of acres or presently settled land." Dave Foreman, Earth First.

What is not sustainable?

Ski runs, grazing of livestock, plowing of soil, building fences, industry, single family homes, paves and tarred roads, logging activities, dams and reservoirs, power line construction, and economic systems that fail to set proper value on the environment." UN's Biodiversity Assessment Report.

Hide Agenda 21's UN roots from the people

"Participating in a UN advocated planning process would very likely bring out many of the conspiracy- fixated groups and individuals in our society… This segment of our society who fear 'one-world government' and a UN invasion of the United States through which our individual freedom would be stripped away would actively work to defeat any elected official who joined 'the conspiracy' by undertaking LA21. So we call our process something else, such as comprehensive planning, growth management or

smart growth." J. Gary Lawrence, advisor to President Clinton's Council on Sustainable Development.

Executive Order # 13575: The theft of rural and agricultural lands for UN Agenda 21

July 14, 2011 by ppjg
Marti Oakley
http://ppjg.wordpress.com/2011/07/14/execu...r-un-agenda-21/

New Council or not, it would be a relatively simple matter to halt the coming terrorism by corporate federal agencies against agricultural property owners. Our governors would have only to refuse any contracting with these federal corporations which would deny them access inside the geographical boundaries of the states.

[dohtml]<object style="height: 390px; width: 640px"><param name="movie" value="http://www.youtube.com/v/YUSRC-TOjlc?version=3"><param name="allowFullScreen" value="true"><param name="allowScriptAccess" value="always"><embed src="http://www.youtube.com/v/YUSRC-TOjlc?version=3" type="application/x-shockwave-flash" allowfullscreen="true" allowScriptAccess="always" width="640" height="390"></object>[/dohtml]

Obama recently signed EO 13575, establishing the White House Rural Council. The council is a list of the most aggressive agencies and departments in the US government. The all inclusive council members represent the very agencies and departments most dedicated to forcing the subjugation of the US to United Nations control. In fact, many of the agencies, departments and organizations listed as Council members are in fact creations of the UN; created for no other purpose than to give the United Nations direct access to the United States.

This council can be viewed as nothing less than the establishment of a domestic terrorism group which will orchestrate the coming assault on private agricultural property owners in an effort to force them off their land and out of production. There was an effort during the Reagan presidency to launch a similar assault on individual owners of agricultural land which would have displaced more than 2 million people, handing their land over to others who were more amenable to the government and UN control.

[dohtlml]<object style="height: 390px; width: 640px"><param name="movie" value="http://www.youtube.com/v/_juUVKKBw-k?version=3"><param name="allowFullScreen" value="true"><param name="allowScriptAccess" value="always"><embed src="http://www.youtube.com/v/_juUVKKBw-k?version=3" type="application/x-shockwave-flash" allowfullscreen="true" allowScriptAccess="always" width="640" height="390"></object>[/dohtml]

The new White House Rural Council is led by many of the same government agencies that lead the National Invasive Species Council (under the USDA). It is preceded by Clinton's 1993 creation: President's Council on Sustainable Development. Sustainable development being the cornerstone of UN Agenda 21 mandates for theft of property from the individual.

Next came the National Invasive Species Council (NISC) created by Clinton Executive Order 13112 in 1999 and co-chaired by the Secretaries of the Interior, Agriculture, and Commerce. NISC members include the Secretaries of State, Defense, Homeland Security, Treasury, Transportation, Health and Human Services, the U.S. Trade Representative (USTR), as well as the Administrators of the U.S. Environmental Protection Agency, National Aeronautics and Space Administration, and U.S. Agency for International Development.

Stunning in the inclusion of the Department of Defense and NASA, the Rural Council represents the greatest threat to independent and family farming and ranching and is focused primarily on the heartland…..for now. The actual focus of the Council will be to remove as many as possible from valued agricultural lands across the country. Drawing on the Department of Interior and Bureau of Land (mis) Management's claim that only they can determine beneficial and/or adequate use of available lands, waters and resources, the Council is set to displace a large portion of America's private agricultural operations and the attached property rights, substituting them with Big AG corporate contractors; All for the global economy and to the detriment of life around the globe. What isn't handed over to bio-pirates as a gift will be handed to the UN for their UN Agenda 21 biodiversity/non-human habitat plan.

It is important to understand why all these various agencies were included. This is to by-pass non-positive code & title. What could not be codified into public law stands only as prima facie evidence of non-positive code & title.

A complete list of all codes & titles can be found here:

For the purposes of the Council just created and the Councils set up by Clinton, these agencies circumvent Constitutional prohibitions meant to prevent the Federal government from encroaching and expanding its power unlawfully into these areas: Not one of these Titles can be codified and enacted into public law as they are outside the enumerated powers of the federal government, and as such, are unenforceable.

Title 6 Homeland Security. (formerly Surety Bonds, which was repealed; see Title 31)

Title 7 Agriculture.

Title 8 Aliens and Nationality.

Title 15 Commerce and Trade.

Title 16 Conservation.

Title 21 Food and Drugs.

Title 22 Foreign Relations and Intercourse.

Title 30 Mineral Lands and Mining.

Title 33 Navigation and Navigable Waters..

Title 42 Public Welfare.

Title 43 Public Lands.

_____

While many wondered why every alphabet soup agency or department was included in what I consider to be a newly forming government sponsored domestic terrorism organization, it appears obvious to me; Including every possible agency and department covers all the bases. If the EPA or BLM can’t terrorize you into forfeiting your land and your livelihood, there are copious numbers of other agencies who will move in to attack from various angles. Because of the massive number of agencies and departments involved, just stepping out the front door of your farm or ranch house will now be a matter of breaking some rule, regulation or unknown provision that will be the catalyst used to begin the wholesale attack by government agents and agencies and none of it will be lawful.

The newly formed Rural Council is poised to move vast numbers of family and independent farmers and ranchers off their valuable and productive land. This Council

which will be used to perform acts of domestic terrorism against US citizens under the guise of " natural security, land stewardship, conservation, best land practices, best animal practices, beneficial use of water, restoring agricultural economies, for the greater good, for all of mankind, saving the environment, and of course the ever changing "global warming/climate change bs along with other innocuous and non-threatening sounding jingo's, is the Trojan horse rolling out of the United Nations.

What is about to take place under the UN's watchful eye is an unlawful detainer: The Act or judicial fact of withholding from a person lawfully entitled the possession of land or goods: Or, the restraint of a man's personal liberty against his will. This is a forced taking of private property: an unlawful detainer. And, it is about to happen with great frequency.

New Council or not, it would be a relatively simple matter to halt the coming terrorism by corporate federal agencies against agricultural property owners. Our governors would have only to refuse any contracting with these federal corporations which would deny them access inside the geographical boundaries of the states. In fact, revocation of previous contracts with these same federal corporations which are in fact, foreign to the states, could go a long way in repairing the damage done from decades of federal interference.

The time worn argument for contracting with federal corporations, is funding. Governors and legislators will claim that the state will lose mountains of federal funding that the state needs if the contract is refused or revoked. But….where does that funding come from? From the states via the taxpayers and the funding money is for corporate federal programs. Get rid of the corporate federal programs and agencies, and there will be little need for funding as the burden on the citizens of the states to comply in exchange for otherwise unneeded funds diminishes exponentially.

The sad truth is that our governors will throw the door wide open to more encroachment and most all legislators will follow suit. Hard times are coming for the heartland as agricultural land is seized and property rights are trashed.

The White House Rural Council is in my estimation…….a war council and one which has declared its intention to mount an attack on property owners across the nation. The most disdainful part of this is that these attacks will be the result of one American turning on the other as lines are drawn between the general public and those who turned their backs on everyone else while they aligned them selves with terrorists in our government.

---

US Code & Title positive and non-positive

Clinton's PCSD

In 1993 with Bill Clinton's President's Council on Sustainable Development (PCSD) – (this is the direct link to Agenda 21) was established. Here is a list of the major Executive Departments:

Executive Departments
Department of Agriculture (USDA)
Department of Commerce (DOC)
Department of Defense (DOD)
Department of Education (ED)
Department of Energy (DOE)
Department of Health and Human Services (HHS)
Department of Homeland Security (DHS)
Department of Housing and Urban Development (HUD)
Department of Justice (DOJ)
Department of Labor (DOL)
Department of State (DOS)
Department of the Interior (DOI)
Department of the Treasury
Department of Transportation (DOT)
Department of Veterans Affairs (VA)

ALL of them have a Sustainable Development (SD) plan as required by UN Agenda 21.

TheUnhivedMind - July 15, 2011 06:46 PM (GMT)

Global fertility dropping dramatically as UN celebrates World Population Day

July 12, 2011
By Daniel Taylor http://www.oldthinkernews.com/?p=1597

World Population Day was celebrated yesterday, as it has been every year since 1989. Propaganda spewed from the United Nations and other “green” organizations tell us that our carbon footprint needs to be reduced, we are having too many children, and our energy consumption needs to be cut in half.

This propaganda is for the ignorant general public that will follow along with trendy ideals that are cloaked with false righteous indignation. The organization Planetsave tells us, “Cut your carbon footprint and consider having a smaller family. In the United States, the carbon legacy and greenhouse gas impact of an extra child is almost 20 times more important than all of the “green” practices you might employ in your entire lifetime…”

Something must be done immediately to curb human population growth, we are told. We should all feel guilty for having more than one child. In reality a conscious and deliberate campaign to depopulate the world has been ongoing for at least a hundred years – and its working; So much so that Deutsche Bank issued a report in May of this year warning that the human population globally will no longer be replacing itself by the 2020′s. As the report states,

“In our view, the human race will no longer be replacing itself by the early 2020s. Population growth will continue for a few more decades because of momentum from the age structure and people living longer but, reproductively speaking, our species will no longer be growing. This will be one of the most important turning points in history.”

In 2009 The Economist magazine also acknowledged the dramatic decline in global fertility.

Demographers have always known that modernization and the raising of standards in society will lower population naturally. As the Deutsche Bank report explains, this has been contributing to the lowering of fertility over the past 200 years. Frank Notestein, first director of the Population Division at the U.N., bluntly stated that while modernization will lower population, extreme measures – such as the institution of totalitarian regimes – need to be taken to quicken the pace of depopulation.

“Birthrates in the past have fallen most rapidly in the context of modernization and social-economic change,” writes Notestein in a 1969 paper. “To achieve zero rate of population growth governments will have to do more than cajole; they will have to coerce.” Notestein concludes, “…to impose more drastic changes on a large scale implies many risks, not least to the regime that undertakes them. The price for this type of population control may well be the institution of a totalitarian regime.”

It’s not all natural trends

Natural trends in society have partially led to the presently falling fertility rates globally, but there are other insidious factors as well. Here are a few outstanding examples:
Just as Frank Notestein advocated, current Science Adviser John P. Holdren porposes in his 1977 textbook Ecoscience: Population, Resources, Environment, that a “Planetary Regime” dictate population control measures. Included in the proposal is the use of sterilants added to water supplies.
Bisphenol A (BPA), a chemical added to a wide variety of products, has been connected to fertility problems.
Cell phones have also been connected to fertility issues. Research has shown that cell phone radiation has “a significant genotoxic effect on …spermatozoa” in mice.
Anti-Fertility vaccines have been developed and used for decades across the world. Activist Matthew McDaniel encountered first hand the effects of these vaccines (Tetanus Toxoid bound with the hormone hCG) on the Akha people in Thailand.

Presentations from the history channel glorify the dream of eco-fascists of a world without humans. Will the true crisis of the future be that of restoring human fertility?

Share of children in U.S. hits bottom

Census report reveals only 24% are under 18

Published: Tuesday, July 12, 2011 10:02 p.m. MDT
By Hope Yen, Associated Press
http://www.deseretnews.com/article/7001512...its-bottom.html

WASHINGTON — Children now make up less of America's population than ever before, even with a boost from immigrant families.

And when this generation grows up, it will become a shrinking work force that will have to support the nation's expanding elderly population — even as the government strains to cut spending for health care, pensions and much else.

The latest 2010 census data show that children of immigrants make up 1 in 4 people under 18, and are now the fastest-growing segment of the nation's youth, an indication that both legal and illegal immigrants as well as minority births are lifting the nation's population.

Currently, the share of children in the U.S. is 24 percent, falling below the previous low of 26 percent of 1990. The share is projected to slip further, to 23 percent by 2050, even as the percentage of people 65 and older is expected to jump from 13 percent today to roughly 20 percent by 2050 due to the aging of baby boomers and beyond.

In 1900, the share of children reached as high as 40 percent, compared to a much smaller 4 percent share for seniors 65 and older. The percentage of children in subsequent decades held above 30 percent until 1980, when it fell to 28 percent amid declining birth rates, mostly among whites.

"There are important implications for the future of the U.S. because the increasing costs of providing for an older population may reduce the public resources that go to children," said William P. O'Hare, a senior consultant with the Baltimore-based Annie E. Casey Foundation, a children's advocacy group.

Pointing to signs that many children are already struggling, O'Hare added: "These raise urgent questions about whether today's children will have the resources they need to help care for America's growing elderly population."

The numbers are largely based on an analysis by the Population Reference Bureau, a nonprofit research group in Washington that studies global and U.S. trends. In some cases, the data were supplemented with additional census projections on U.S. growth from 2010-2050 as well as figures compiled by the Annie E. Casey Foundation's Kids Count project.

Nationwide, the number of children has grown by 1.9 million, or 2.6 percent, since 2000. That represents a drop-off from the previous decade, when even higher rates of immigration by Latinos — who are more likely than some other ethnic groups to have large families — helped increase the number of children by 8.7 million, or 13.7 percent.

Percentages aside, 23 states and the District of Columbia had declines in their numbers of children in the century's first decade, with Michigan, Rhode Island, Vermont and D.C. seeing some of the biggest drops.

On the other hand, states with some of the biggest increases — Arizona, Florida, Georgia, Nevada, North Carolina and Texas — also ranked in the bottom one-third of states in terms of child well-being as measured by the Kids Count project. The project calculated child well-being based on levels of poverty, single-parent families, unemployment, high-school dropouts and other factors.

The slowing population growth in the U.S. mirrors to a lesser extent the situation in other developed nations, including Russia, Japan and France which are seeing reduced growth or population losses due to declining birth rates and limited immigration. The combined population of more-developed countries other than the U.S. is projected to decline beginning in 2016, raising the prospect of prolonged budget crises as the number of working-age citizens diminish, pension costs rise and tax revenues fall.

Japan, France, Germany and Canada each have lower shares of children under age 15, ranging between 13 percent in Japan and 17 percent in Canada, while nations in Africa and the Middle East have some of the largest shares, including 50 percent in Niger and 46 percent in Afghanistan, according to figures from the United Nations Population Division.

In the U.S., the share of children under 15 is 20 percent.

Depending on future rates of immigration, the U.S. population is estimated to continue growing through at least 2050. In a hypothetical situation in which all immigration — both legal and illegal — immediately stopped, the U.S. could lose population beginning in 2048, according to the latest census projections.

Since 2000, the increase for children in the U.S. — 1.9 million — has been due to racial and ethnic minorities.

Currently, 54 percent of the nation's children are non-Hispanic white, compared to 23 percent Hispanic, 14 percent black, and 4 percent Asian.

Over the past decade, the number of non-Hispanic white children declined 10 percent to 39.7 million, while the number of minority children rose 22 percent to 34.5 million. Hispanics, as well as Asians, Native Hawaiians, Pacific Islanders and multiracial children represented all of the growth. The number of black and American Indian children declined.

In nearly 1 of 5 U.S. counties, minority children already outnumber white children.

"The 'minority youth bulge' is being driven primarily by children in immigrant families," said Mark Mather, associate vice president of the Population Reference Bureau who co-wrote a report released Tuesday on the subject. "They are transforming America's schools, and in a generation they will transform the racial-ethnic composition of the U.S. work force."

"Policymakers are paying a lot of attention to the elderly, but we have a large population of children who have their own needs," he said.

The numbers come as states around the nation are seeking to cut education spending and other programs — rather than raise taxes — to close gaping budget holes as schools districts run out of $100 billion in federal stimulus money that helped stave off job losses over the past two years.

In Texas, for instance, the Legislature changed state law so it could slash education spending by $4 billion over the next two years to help make up for a $27 billion budget shortfall.

The move is the first cut in per-student spending in Texas since World War II, even as the state has gained nearly 1 million children over the past decade, many of them Hispanic.

The school cutbacks are expected to have a disproportionate effect on low-income communities which are less able to raise local school taxes. Advocates believe that could further widen the achievement gap between students of different races in states

like Texas, where some of the fastest student growth is among those who are poor and whose primary language is not English.

The resulting cuts will be far-reaching and surprising to many parents and communities, from teacher layoffs to reductions in extracurricular programs and ballooning class sizes, said Jenny LaCoste-Caputo, a spokeswoman for the Texas Association of School Administrators.

The U.N. and “Livestock’s Long Shadow”

July 8, 2011 by ppjg
http://ppjg.wordpress.com/2011/07/08/16955/

_____

“By restricting access to grazing land, for example, land and related feed resources become relatively scarce, so technical change will move towards making more efficient use of these resources…The same applies to all other natural resources that feed into the livestock production process, such as water or nutrients.

_____

In 2006, the United Nation’s Food and Agriculture Organization (FAO) and Livestock Environment and Development (LEAD), supported by US AID and the World Bank, put out a 416 page report titled “Livestock’s Long Shadow.” Statements made in this document should make American ranchers and farmers look for the United Nation’s long shadow over their land and water.

We’ll start off with some points the FAO made in the report, then some of their solutions (which, by the way, seem a lot like communism). Then I’ll tell you why I think this report is, pardon the pun, bullshit.

THIS FAO REPORT STATES:

“The livestock sector emerges as one of the top two or three most significant contributors to the most serious environmental problems, at every scale from local to global.

The findings of this report suggest that it should be a major policy focus when dealing with problems of land degradation, climate change and air pollution, water shortage and water pollution and loss of biodiversity.”

“The environmental impact per unit of livestock production must be cut by half, just to avoid increasing the level of damage beyond its present level.”

LAND DEGRADATION – “The livestock sector is by far the single largest anthropogenic user of land. The total area occupied by grazing is equivalent to 26 percent of the ice-free terrestrial surface of the planet. In addition, the total area dedicated to feedcrop production amounts to 33 percent of total arable land. In all, livestock production accounts for 70 percent of all agricultural land and 30 percent of the land surface of the planet.”

ATMOSPHERE and CLIMATE – “With rising temperatures, rising sea levels, melting icecaps and glaciers, shifting ocean currents and weather patterns, climate change is the most serious challenge facing the human race. The livestock sector is a major player, responsible for 18 percent of greenhouse gas emissions measured in CO2 equivalent.”

WATER – “The world is moving towards increasing problems of freshwater shortage, scarcity and Depletion…The livetock sector is a key player in increasing water use, accounting for over 8 percent of global human water use, mostly for the irrigation of feedcrops…in the United States, with the world’s fourth largest land area, livestock are responsible for an estimated 55 percent of erosion and sediment, 37 percent of pesticide use, 50 percent of antibioticuse, and a third of the loads of nitrogen and phosphorus into freshwater resources. Livestock also affect the replenishment of freshwater by compacting soil, reducing infiltration degrading the banks of watercourses, drying up floodplains and lowering water tables. Livestock’s contribution to deforestation also increases runoff and reduces dry season flows.”

BIODIVERSITY – “Livestock now account for about 20 percent of the total terrestrial animal biomass, and the 30 percent of the earth’s land surface that they now pre-empt was once habitat for wildlife. Indeed, the livestock sector may well be the leading player in the reduction of biodiversity, since it is the major driver of deforestation, as well as one of the leading drivers of land degradation, pollution, climate change, overfishing, sedimentation of coastal areas and facilitation of invasions by alien species.”

“…livestock actually detract more from total food supply than they provide. Livestock now consume more human edible protein than they produce. In fact, livestock consume 77 million tonnes of protein contained in feedstuff that could potentially be used for human nutrition…”

THE SOLUTIONS THAT FAO SUGGESTS:

“Many producers will need to find alternative livelihoods.”

“Small family-based livestock producers will find it increasingly difficult to stay in the market, unless effective organizational arrangements, such as contract farming or cooperatives, can be designed and used… the loss of competitiveness requires policy interventions, not necessarily to maintain smallholder involvement in agriculture, but to provide opportunities for finding livelihoods outside the agricultural sector and to enable an orderly transition.”

“By restricting access to grazing land, for example, land and related feed resources become relatively scarce, so technical change will move towards making more efficient use of these resources…The same applies to all other natural resources that feed into the livestock production process, such as water or nutrients. Likewise, new costs associated with… livestock production, such as emissions of ammonia or other forms of waste, will lead to increased efforts towards their avoidance.”

“Most frequently natural resources are free or underpriced, which leads to overexploitation and pollution. Often perverse subsidies directly encourage livestock producers to engage in environmentally damaging activities… One requirement for prices to influence behaviour is that there should be secure and if possible tradable rights to water, land, use of common land and waste sinks.”

“Public policies need to protect and enhance public goods, including the environment. The rationale for public policy intervention is based on the concept of market failures. These arise because many local and global ecosystems are public goods or “commons,” and the negative environmental impacts that livestock have on them are “externalities” that arise because individual economic decisions usually consider only private individual costs and benefits.”

“Achieving greater efficiency in irrigation in the broader sense may mean giving up water to other sectors where it has higher value uses, even if sometimes that implies reducing the value of agricultural output.”

“…the removal of subsidies has been shown to have a strong potential to correct some of the environmental damage caused by livestock production.”

WHY FAO’S REPORT IS BULLSHIT:

The United Nation’s FAO, along with its CODEX ALIMENTARIUS, has been PUSHING ANIMAL CLONING FOR YEARS. So this issue isn’t about too many animals on the earth, or the environment, or feeding the hungry – it’s most likely about who owns the patents for the cloned animals and biotechnology, and who will own and control all food (and people, land and resources) in the future.
FAO issued a statement about cloned animals:

“The statement was published in March 2000 on the occasion of the ‘Codex Alimentarius Ad Hoc Intergovernmental Task Force on Foods Derived from Biotechnology’ meeting in Japan.

Biotechnology provides powerful tools for the sustainable development of agriculture… When appropriately integrated with other technologies for the production of food, agricultural products and services, biotechnology can be of significant assistance in meeting the needs of an expanding and increasingly urbanized population in the next millennium.”

(Apparently, this urbanized population would be increased after they run small farmers and ranchers off their land and force them to find “alternative livelihoods.”)

THE U.S. DEPARTMENT OF AGRICULTURE – INTERNATIONAL OVERVIEW

On the U.S.D.A website, there is a page with an “International Overview” stating “All of agriculture has become global. For example, the success of the U.S. farm sector is increasingly dependent on our ability to trade and compete with other nations. Similarly, the science of agriculture depends on international research partnerships to address national issues of food safety, sustainability, resource management, biotechnology, and crop and livestock disease prevention.

In 2007, the U.S.D.A. signed an agreement with the FAO to support the development of sustainable agriculture (agricultural biotechnology) in developing countries.

U.S.D.A.’s CSREES has been actively promoting animal cloning and biotechnology. (It’s ironic that the U.S.D.A. also has the National Invasive Species Information Center.)

In a U.S.D.A. Foreign Agricultural Service document, Framework Agreement on Increased Cooperation between U.S.D.A. and the FAO, the U.S.D.A. was to agree to “further USDA’s goal of cooperating with international agricultural organizations in activities that promote and further develop the global agricultural system. USDA will provide funds and resources to support FAO projects that advance that goal, that advance FAO’s work towards meeting the Millennium Development Goals (MDGs) in developing countries, and that contribute to the realization of FAO’s programme of work/ mid-term strategy as approved by FAO’s Governing Bodies.”

U.S.D.A. was also to agree that “No member of the United States Congress will be admitted to any share or part of this Agreement or any subsequent Programme Agreement, or to any benefit arising thereof.”

What about the U.S. Constitution? What about the American taxpayers, who pay for FAO’s projects while we have cuts to our Social Security?

The U.N.’s Agenda 21 (Chapter 38) states: “All agencies of the United Nations system have a key role to play in the implementation of Agenda 21.” Is the FAO, with the help of the U.S.D.A., implementing Agenda 21 in America?

AUTHOR’S NOTE: I’ve been going to the roundups of our wild horses (the Bureau of Land Management is removing the wild horses from their federally protected Herd Management Areas, then leasing the same land for $2 an acre for oil and gas lease sales, or permitting new mining and mining expansions to foreign owned companies). Some ranchers think these wild horse roundups will help them gain more grazing for their livestock. I think the wild horses are the canary in the coal mine. Ranchers, your cattle and sheep will be next. As go these American icons that stand as symbols of our freedom, so goes our freedom.

Title: Chinese province looks to ease 'one child' policy

TheUnhivedMind - July 13, 2011 05:41 PM (GMT)

Chinese province looks to ease 'one child' policy

China's most populous province is trying to ease the country's decades old "one-child" policy, with officials saying the high cost of raising children is enough to hold down birth rates.

By Our Foreign Staff
5:59PM BST 13 Jul 2011
http://www.telegraph.co.uk/news/worldnews/...ild-policy.html

Guangdong has applied to the central government to allow qualified couples to have two children if either the husband or the wife is an only child, the official English-language China Daily newspaper reported on Wednesday.

"The province ... is now waiting for approval to be the leader in the country in the relaxation of the family-planning policy," said Zhang Feng, director of the Guangdong population and family-planning commission.

After decades of rapid economic growth in the world's most populous nation, many of China's newly affluent are putting pressure on officials to ease away from restrictions that have been in place since the early 1980s. The Guangdong case could set a pattern for other regions.

Even as the one-child policy has created a host of new problems, including uneven and coercive enforcement measures as well as a severe gender imbalance to name a few, China's huge population of 1.34 billion still exerts severe strains on the country's resources and the environment.

But proponents of a change have new economic arguments to support their case.

China's most recent census released in April showed the proportion of young Chinese is shrinking as the elderly population grows, a fact many demographers have warned could choke the world's fastest-growing major economy as fewer people are left to work and pay for a greying population.

The latest national population figure, based on the 2010 census, was up 5.9 per cent from the 1.27 billion counted in 2000, but lower than the 1.4 billion population some demographers had projected for the latest tally.

Guangdong's birth rate had remained low for more than 10 years, Zhang said, with women there giving birth to 1.7 children on average over the past decade.

Nationwide, government controls on family size have brought down annual population growth to below 1 per cent and the rate is projected to start falling in coming years, raising worrying questions about a greying population.

While the central government enforces the one-child policy unevenly – couples in many urban areas who are themselves single children are permitted two of their own – policy-makers have shown little intention of abandoning it.

"I don't know whether the central government will give the green light to Guangdong or not, or when Guangdong's application will be approved, but the province now has room to relax the one-child policy, which has been in place for more than three decades," Zhang said.

China's National Population and Family Planning Commission could not be reached for comment.

Zhang said easing the policy would not lead to a baby boom because the cost of giving birth and raising children had risen steeply. Annual inflation in China hit a three-year high of 6.4 per cent in June.

At the same time, while China is now the second-largest economy in the world, it ranks far lower on a per-capita basis, and allowing the population to rise would only further strain employment demands and other challenges for the government.

Cuba’s Population Shrinking, Growing Old

9 Jul 2011
http://www.laht.com/article.asp?ArticleId=...ategoryId=14510

HAVANA – The proportion of Cuban residents over 60 grew last year by 0.4 percent to nearly 2 million, Communist Party daily Granma said Thursday.

“Older adults” now constitute 17.8 percent of Cuba’s 11.2 million inhabitants, the newspaper said, citing data from the National Statistics Office, or ONE.

In 1985, people older than 60 were 11.3 percent of the Cuban population. The ONE projects that proportion will grow to 30 percent within two decades as the number of working-age Cubans continues to decline “notably,” Granma said.

Cuba’s Communist government is concerned about the prospects for a smaller workforce and has responded by raising the retirement age.

Cuba’s population shrank last year, a development the ONE and Latin American and Caribbean Center for Demography attribute mainly to aging and a decline in birth rates.

The island is expected to lose another 100,000 residents by 2025 and the population is on course to dip below 11 million in 2032. EFE

Historic Polish bill to ban all abortion clears first vote 254-151

by Kathleen Gilbert
Fri Jul 01, 2011 11:34 EST
http://www.lifesitenews.com/news/poland-bi...irst-major-vote

WARSAW, July 1, 2011 (LifeSiteNews.com) - A massive grassroots campaign in Poland to implement a total ban on abortion witnessed an important victory Friday as the lower house of the Polish parliament fought off a first round of voting intended to scrap the historic bill.

Sejm lawmakers voted 254-151 against a motion by the pro-abortion communist Democratic Left Alliance to reject the measure. In a second vote, the legislation was sent back to committee for further consideration, forcing a slower legislative path.

LifeSiteNews.com learned earlier this week that the ban was thrust forward by strong pro-life sentiment in the former Communist country, where sponsors, requiring 100,000 signatures within three months to bring the bill forward, obtained 600,000 in two weeks.

Technically, abortions in Poland currently may only be obtained when the child is diagnosed with a serious condition, the mother diagnosed with a health problem, or where the pregnancy resulted from “illegal activity.” But local leaders say that the exceptions - whereby the procedure is still illegal but “not punishable” - are routinely abused by abortionists.

In a speech before Parliament on Thursday, Mariusz Dzierzawski of the Polish pro-life PRO Foundation described abortion as the country’s heritage from communist times, when “children were killed in their mothers’ wombs on a mass scale in public hospitals

and private offices."

"What differentiates good states from evil states? The way in which they treat the human person," said Dzierzawski. "A good state is one where every person is respected, and institutions serve good ends.

"Totalitarian states ignore the dignity of the person. ... Every genocide begins with denying the humanity of the victims."

The current effort would strike down all three exceptions to the legal penalty. It requires two more votes in the lower chamber before it moves to the Senate.

In an open letter to parliamentarians, the National Ob/Gyn Section of the Catholic Association of Polish Medical Doctors expressed their support for the measure.

The doctor is the 'servitor Vitae' - a servant of Life and should protect human life from its beginning to its natural death," said president Maria Szczawinska. "We are not refusing the right to rescue human life, but we strongly oppose killing the unborn child. That is why we join the many voices in support of the project totally banning the killing of unborn children." http://www.lifesitenews.com/news/polish-ob...al-abortion-ban

OREGON SHERIFF STANDS UP AGAINST THE U.S. FOREST SERVICE

By Sarah Foster
July 2, 2011
http://www.newswithviews.com/NWV-News/news260.htm

Josephine County, Oregon -When Gil Gilbertson was sworn is as Sheriff of Josephine County, a rural county in southwest Oregon, in 2007, he had 30 years of law enforcement experience behind him, both in the United States and with various military missions overseas.

So when citizens of the county began coming to him complaining of “harassment” by U. S. Forest Service law enforcement officers (LEO), he said he’d investigate their concerns, figuring he could work things out with the local ranger district. After all, as the county’s chief law enforcement officer he was in the “club” and moreover had gotten along with the “feds” -- though he disagreed with their road closing policies and other efforts to keep the public off public lands which cover 68 percent of the rural county.

“You know, until about a year ago this wasn’t even on my radar,” Gilbertson told NewsWithViews. “It was the miners that were coming to me saying they were being harassed. I said I’d look into it.”

He contacted the local ranger district for information, but instead of answers he was bluntly told that No, they couldn’t, wouldn’t discuss anything about any complaints with him, but he could file a FOIA (Freedom of Information Act) request and they’d get back to him.

“Go Pound Sand”

As talk-radio host Bill Meyer [of KMED] put it in an interview with Gilbertson, the Forest Service had essentially told the sheriff to “go pound sand.” Federal agencies are notorious for taking months and years to answer FOIAs Meyer said.

“I’m not going to file any FOIA,” Gilbertson told Meyer. “I think that they’re obligated to impart that information to me.”

On May 5, Gilbertson sent a blistering letter to the District Ranger of the Wild Rivers Ranger District in Caves Junction, setting down in no uncertain terms his objections not only to the Forest Service response to his requests for information but his dissatisfaction with USFS policies.

“Frankly, I was somewhat taken aback by your legal department’s position advising you to not discuss issues with me,” he wrote, adding he was “aghast” at the refusal to provide information without a FOIA “to find out what your agency is doing in regards to the citizens of this county.” He continued:

As the CLEO [chief law enforcement officer] of this county, elected by the citizens, saddled with the expectation and responsibility to safeguard their rights, I fully intend to uphold the laws against any threat, inappropriate or unlawful actions against them.

The issues of illegal road closures, grazing, logging, minerals, taking land under the auspices of ‘Monument’ status, citizen complaints against your LEO agents, high unemployment and other socio-economic issues we all face today; coupled with the uncooperative nature presented by the USFS are causing me great concern about our relationship and future cooperation.

The following day he released the contents of the letter to the public at a meeting of the South West Oregon Mining Association, which posted it on their website. He explained he’d been discussing the issue and sharing information with Sheriff Glenn Palmer of Grant County, Ore., who sent a similar letter [dated March 31] to Teresa Raaf, supervisor of Malheur National Forest.

In his letter Sheriff Palmer questioned the USFS's authority to engage in law enforcement within Grant county, declaring: "your jurisdiction as I see it is limited to the Federal Building in John Day" [the county seat]; and that the presence of USFS "Law Enforcement" violates Article 1, Section 8 of the U.S. Constitution.

Advertisement

“Within the confines of Grant County, Oregon, the duties and responsibility of law

enforcement will rest with the County Sheriff and his designees," he wrote.

Palmer's letter was apparently prompted by Forest Service attempts to pressure him into signing a "co-operative policing agreement" that would allow the agency to engage in law enforcement activities inside the lines of Grant County.

Palmer said that in the near future, he'll be raising other issues about USFS's activities in Grant County, including its recent treatment of the local citizenry, illegal road closures, grazing, logging and other concerns that he and his community have. He also expressed concern about the way Forest Service LEOs had treated "treated citizens of this county in Oct. and Nov., 2010," but deferred giving details until a later time.

Drawing the Line

Sheriffs Gilbertson and Palmer have crossed personal Rubicons to join a growing cadre of sheriffs in western states who are drawing the line against federal agencies like the Forest Service.

For instance, Sheriff Greg Hagwood, of Plumas County in northern California, has publicly stated he will not enforce federal regulations laid down by the Forest Service that demand road closures and restrict vehicle access to the land.

Asked if he agreed with Hagwood, Gilbertson said he was not familiar with Hagwood's action, but agreed with him and pointed to the famous case of Prinz v. United States (1997).

"The Supreme Court ruled that the federal government cannot force us [local law enforcement] to enforce federal regs, rules or laws," he said. "They can't force sheriffs to do that. The sheriff is the highest law enforcement official for that county. My understanding is that there is no other authority that supersedes the sheriff's office for that county."

Gilbertson said that he had recently signed a cooperative policing agreement with the Forest Service, "but I will rescind it immediately if I determine that it was a mistake," he promised.

Since his letter was released Gilbertson has appeared on various talk shows, where he discusses the issues that affect not only Josephine County but the entire country.

Meanwhile, at a meeting of the Oregon State Sheriffs' Association, Gilbertson agreed to head a committee to research the many questions that have arisen regarding federal jurisdiction and the limits – if any -- to federal authority.

"We're checking to see if things are being done appropriately according to the U.S. Constitution and the laws that govern all this," said Gilbertson. "So it's a process right

now that we're in the research phase. … I'm looking at doing all the research before I make a final decision.

Gilbertson also explained that for him the road-closing issue is a safety issue. "If I need to go Search-and-Rescue, or if I need to go look for crime or marijuana grows, I don't need those roads closed; I need them open so I can get to them.

"You're not supposed to take any vehicles onto certain federal lands. But guess what. If I've got somebody missing, if I need to take a helicopter in I will. That's my authority as a sheriff and I'm not going to let anyone stand in my way to protect the people of this county."

Enter Your E-Mail Address:

Gilbertson pointed specifically to the "Biscuit Fire" in July 2002, which burned nearly 500,000 acres of Siskiyou National Forest and much of the Kalmiopsis Wilderness.

"They had a big tanker loaded with chemicals ready to go, but were told not to dump because it was on a wilderness area," said Gilbertson bitterly. "Had they been allowed to dump they would have suppressed the fire right there. The same thing is happening in Arizona right now," he added. "It's nonsense."

"They've let these forests grow so you have all this fuel that burns and just goes crazy. If they would go in and thin it out – that's good stewardship. But they've gone from being good stewards to being over-lords that think they have unlimited authority."

View Full Version: 1.3million driven off the road as cost of petrol

Title: 1.3million driven off the road as cost of petrol
Description: *passes £1,700 a year*

TheUnhivedMind - July 5, 2011 04:23 PM (GMT)

1.3million driven off the road as cost of petrol passes £1,700 a year

Last updated at 4:07 PM on 5th July 2011
http://www.dailymail.co.uk/news/article-20...1-700-year.html

An estimated 1.3million people have given up driving over the past year because of the rising cost of motoring.

The average car owner is now spending around £1,720.69 per year to fuel their vehicle, which is a 22.9 per cent year-on-year increase, Sainsbury's Car Insurance said.

Some 76 per cent of motorists have changed their driving habits in the past 12 month, according to the research, in a bid to cut the cost of driving.

The research comes amid challenging conditions for consumers as the soaring cost of living and muted wages growth stifles spending power.

The average cost of petrol is 136.07p a litre, according to most recent figures from the AA, down 0.86p on the mid-May average but higher than the 135.75p-a-litre figure on June 5.

Elsewhere, households are feeling the pressure from rising food prices, utility bill hikes and increased duty on alcohol and tobacco.

Some changes to motoring habits identified by the research include stopping filling up tanks fully, which 26 per cent admit to doing, and instead purchasing specific values of fuel.

Some 45 per cent of motorists - 16.5million people - are now driving less and seven per cent have started to car share, the research revealed.

A further 10 per cent - 3.53million - have downgraded their car for one that is cheaper to run.

Last month, Green Flag reported that 14 per cent of motorists plan to stop using their car or get more fuel efficient vehicles and seven per cent have swapped their cars for motorbikes.

The breakdown firm launched a study after seeing a 40 per cent rise in fuel-related call outs at the start of the year, as motorists avoid filling up, only to then run out of petrol.

Since then, prices have continued to rise, barring a small decrease in June, hitting an average of 136.6p per litre for unleaded compared with averages of 111.49p in 2010.

Description: *its demographic problems*

TheUnhivedMind - July 5, 2011 12:39 AM (GMT)

Richard Ehrman: Europe needs to start addressing its demographic problems

Wednesday, 8 July 2009
http://www.independent.co.uk/opinion/comme...ms-1736178.html

Strange things are happening to Europe's populations. Due to their low birth rates, Germany, Russia and several other European countries face a sustained, outright fall in their numbers – something that has never happened before in any advanced economy. Meanwhile many other countries face ageing stagnation. Yet the British population, thanks to high immigration, is projected to continue growing strongly.

Even so, we are still set to emerge from the credit crunch only to find ourselves at the start of a long demographic crunch. Within a decade, as the baby boomers start to retire, the impact of an ageing population on health and social services will really start to make itself felt. Our ambivalence about immigration also muddies the outlook. Labour has used high net migration to help balance the demographic books. But what if the voters call a halt?

Both the main parties now say they will curb immigration, but there has been hardly any consideration of the implications. To find more workers from among our own ranks we could raise the pension age more quickly, and we could try to cut the number of working-age people on benefits – but neither would be easy or popular.

It is also important to realise that increased longevity is only half the reason that our average age is rising. Just as significant is that there are fewer young people to reduce the average. If Europe is to have any hope of addressing its demographic problems it is going to have to get younger. No government should tell people what size of family they should aim for. But there is ample survey evidence that in nearly all European countries

women want more children than they are having.

In Britain, a liberal labour market and a general acceptance of single parenthood have helped to underpin our birth rate. But it is still below replacement level, and we could certainly do better on issues like housing, the tax burden on young families, and the cost and availability of childcare.

Demography is an area in which more joined–up policy making could really make a difference – yet it still gets far less attention than climate change.

Richard Ehrman's The Power of Numbers: Why Europe Needs to Get Younger is published this week by Policy Exchange and the University of Buckingham Press

Title: Court ruling prompts late abortion data release

TheUnhivedMind - July 4, 2011 05:19 PM (GMT)

Court ruling prompts late abortion data release

Government lost the battle over abortion figures at the High Court

4 July 2011 Last updated at 14:28
http://www.bbc.co.uk/news/health-14015096

The government has published data on the number of late abortions carried out in England and Wales, after the High Court ordered it to do so.

The ProLife Alliance anti-abortion group has been fighting for details of the medical reasons for abortions over 24 weeks to be released since 2005.

But the government had said it had feared identifying women concerned, because of the low numbers of cases.

The data shows there were 147 late abortions carried out last year.
Identification fears

Abortion on "social" grounds is only legal in the first 24 weeks of pregnancy.

But the 1967 Abortion Act makes it legal to abort a foetus right up to birth if there is a substantial risk of "serious" physical or mental abnormality.

Up until 2003 the Department of Health published statistics on these late abortions, even when only one or two cases were involved.

But the publication of the figures in 2002 sparked an outcry when it became clear that one termination was carried out on a baby with a cleft lip and palate.

Critics argued that a relatively simple surgical procedure could now repair cleft palates, and anti-abortion groups argued the rules were being flouted to weed out "less than perfect" babies.

A police investigation was launched after a complaint by the Reverend Joanna Jepson, who was born with a jaw deformity.

By 2004, using information now in the public domain, journalists discovered the identity of one of the doctors involved in the abortion.

That led to fears that the identity of the patient could also be revealed.

The Department of Health had already decided in 2003 it would no longer reveal detailed information on late abortions where the number of terminations involving certain medical conditions was less than 10.

The decision affected England and Wales, but it is also the practice in Scotland; the Abortion Act does not apply in Northern Ireland.

In 2005 the ProLife Alliance, which opposes abortion, used the Freedom of Information Act to request the full statistics on abortions for 2003.

When the Department of Health refused, the Information Commissioner backed the PLA request, as did the Information Tribunal.

Eventually the case led to the High Court where the Department of Health had been trying to get the Information Tribunal decision overturned.

After the latest hearing went against it in April, the department decided not to take the case any further.

Club foot

Sixty-six of the late abortions carried out in 2010 were linked to problems in the nervous system, such as spina bifida.

No late abortions were carried out for cleft lip and palate.

However seven were carried out before 24 weeks for this reason.

The statistics released by the department also show eight terminations related to musculoskeletal problems, which could include club foot.

A total of 29 abortions were for chromosomal problems, including 10 for Down's syndrome and 10 for Edwards' syndrome.

The department has also released data on abortions for girls under 16.

There were 3,718 abortions in under-16s, including two for girls aged 12 in 2010.

The figures also reveal that an 11-year-old had an abortion in 2008. This was also the case in 2005 and 2002.

Julia Millington of the ProLife Alliance said: "This is a great victory for transparency and freedom of speech and we are delighted that full information about the justification for late abortions is now being made available in the same detail as it was in 2001."

But Ann Furedi, chief executive of the British Pregnancy Advisory Service which provides abortions, said: "The publication of these statistics after a campaign by the anti-abortion lobby reveals little more than their own vindictiveness."

Michael A. Walsh

Al Gore, America's loopiest ex-vice president, is at it again. Not content with pocketing a fortune by scaring his fellow citizens with the imaginary boogeyman of "man-made climate change," the prophet of doom now wants everybody to save the planet by -- wait for it -- halting population growth.

You heard that right: To save mother Gaia, it's imperative that we kill ourselves as a species. Let a thousand flowers bloom, but be sure to have only one or two kids, lest you make "climate change" worse.

Ladies, this means you: "One of the things we could do about it is to change the technologies, to put out less of this pollution, to stabilize the population, and one of the principal ways of doing that is to empower and educate girls and women," Gore said in New York last week. "When that happens, then the population begins to stabilize and societies begin to make better choices and more balanced choices."

This from a guy who has the carbon footprint of Bigfoot: four kids, a jet-fueled lifestyle, a huge Nashville mansion that's four times the size of the average new American home and uses up 20 times as much electricity.

Hypocrisy, anybody?

Since he lost the whisker-close presidential election of 2000, Gore has turned into a combination of Jeremiah and Croesus, predicting doom while pocketing cash from such harebrained schemes as carbon credits and offsets, under which companies can pay for the right to emit carbon dioxide -- the gas we release every time we exhale.

But the marks have started to get wise: Congress has abandoned "climate-change" legislation, while the Chicago Climate Exchange, in which Gore was a major investor, finally ended its crackpot carbon-trading scheme last year.

So Gore's moved on -- straight back to the early 19th century of Thomas Malthus, who warned direly of the dangers of overpopulation and mass starvation, never foreseeing the dramatic improvements in agriculture that today allow a tiny percentage of the US population to feed the nation.

Liberals generally detest the notion of having the government in the bedroom -- except, apparently, when it's for "a good cause." Thus Gore embraces the notion that we can "stabilize" the population, as if people were animals to be bred according to fiat.

But there's no such thing as a "stable" population: A society that's not busy growing -- unleashing its vast creative energies in the process -- is busy dying.

Given the demands on the welfare state, a society that skews elderly will be unable to afford programs such as Medicare and Social Security, which effectively operate on a pay-as-you-go basis. Fewer kids means drastic cuts in benefits -- as Americans are about to find out.

Indeed, the developed world's problem is the opposite of overpopulation. Twenty countries, all European but for Japan, now have negative population growth. It's not just Russia and the countries of the old East Bloc, but also Germany, Austria, Italy and Greece -- where they're rioting in the streets over the demise of the welfare state. As for Japan, its population is expected to be fully 21 percent lower than its current 127.5 million by 2050.

At more than 300 million souls, the United States is holding steady, with American women having about 2.1 children apiece -- replacement level. Effectively, we've already "stabilized" -- and were it not for immigrants, we'd be declining, too.

So who is Gore talking to? The Third World, that's who. Add Great White Father to his Nobel Peace Prize and his Academy Award honors as he tries to save the planet.

TheUnhivedMind - July 4, 2011 01:17 AM (GMT)

Remember Knight of Malta, Ted Turner comes out with the same nonsense and yet he has five children and owns more land than anyone else in the U.

View Full Version: ALLIANCE FOR CITIZENS RIGHTS WHAT IS AGENDA 21

Title: ALLIANCE FOR CITIZENS RIGHTS WHAT IS AGENDA 21

TheUnhivedMind - July 3, 2011 03:35 AM (GMT)

ALLIANCE FOR CITIZENS RIGHTS

WHAT IS AGENDA 21?

http://www.keepourrights.org/A21.HTM

Agenda 21 is the official report of the United Nations Rio de Janeiro World Summit Conference of 1992, which was built on the premises of General Assembly resolution 44/228 of 22 December 1989, which was adopted when the nations of the world (?) called for the United Nations Conference on Environment and Development.

It is a plan that calls for the international control and regulation of virtually every aspect of human activity that might impact the environment, which is essentially everything humans do.

It is one of the most arrogant statements of government ever conceived, for it literally assumes that man can recreate the Garden of Eden (but only if he has sound direction from a world governing body). A partial list of chapter titles should give you a hint of what this document is all about:
Chapter 3, Combating Poverty
Chapter 4, Changing Consumption Patterns
Chapter 6, Protecting and Promoting Human Health
Chapter 24, Global Action for Women Towards Sustainable Development
Chapter 25, Children and Youth in Sustainable Development
Chapter 29, Strengthening the Role of Workers and Their Trade Unions
Chapter 30, Strengthening the Role of Business and Industry
Chapter 32, Strengthening the Role of Farmers
And so it goes through 40 chapters.

Admittedly, much of what is discussed is worth while, and we all should be concerned with the environmental conditions we create for ourselves and our posterity. But there is a great deal of scientific evidence that indicates the conditions are far from being the critical problem they are being portrayed as; that much of the so-called evidence being relayed to the public is based on less than scientific assumptions, and is being used to frighten people into accepting controls over their lives they would otherwise resist.

Even if most of the claims being made were valid, would it be appropriate to turn the sovereignty of nations over to some unelected world body that will exercise dictatorial powers over the nations' populations?

We do not think so. We still believe it is in the best interest of the American people to have a government that is -- of the people, by the people and for the people, -- not one that would be accountable to no one but itself. That is exactly the kind of government the United Nations is trying to establish, and Americans are being kept in the dark about it by their own elected officials and a news media that is in sympathy with the global ethos.

We offer the following verbatim quotations from Agenda 21 in the hope that it will help give you some understanding of the character of those behind this movement. Color is added for emphasis.
This partnership commits all States [read Nations] to engage in a continuous and constructive dialogue, inspired by the need to achieve a more efficient and equitable world economy. [Ch. 2, Para. 2.1]

...consensus-building at the intersection of the environmental and trade and development areas will be ongoing in existing international forums, as well as in the domestic policy of each country. [Ch. 2, Para. 2.4]

The removal of existing distortions in international trade is essential. (Ch. 2, Para. 2.7)

Provide for an equitable, secure, non-discriminatory and predictable international trading system; [Ch. 2, Para. 2.10(B)]

...create a focus in national development plans and budgets on investment in human capital,with special policies and programmes directed at rural areas, the urban poor, women and children. [Ch. 3, Para. 3.4(d)]

Sustainable development must be achieved at every level of society. [Ch. 3, Para. 3.7]

Measures to be undertaken at the international level for the protection and enhancement of the environment must take fully into account the current imbalances in the global patterns of consumption and production. [Ch. 4, Para. 4.4]

Achieving the goals of environmental quality and sustainable development will require efficiency in production and changes in consumption patterns... [Ch. 4, Para. 4.15]

Governments ... should strive to...develop a domestic policy framework that will encourage a shift to more sustainable patterns of production and consumption. [Ch. 4, Para. 4.17(B)]

Without the stimulus of prices and market signals that make clear to producers and consumers the environmental costs of the consumption of energy, materials and natural resources and the generation of wastes, significant changes in consumption and production patterns seem unlikely to occur in the near future. [Ch. 4, Para. 4.24]

Population data should be disaggregated by, inter alia, sex and age in order to take into account the implications of the gender division of labor for the use and management of natural resources. [Ch. 5, Para. 5.28]

Population programmes should be implemented along with natural resource management and developing programmes at the local level... [Ch. 5, Para. 5.43]

Proposals should be developed for local, national and international population/ environment programmes in line with specific needs for achieving sustainability. [Ch. 5, Para. 5.56]

Governments should take active steps to implement programmes to establish and strengthen preventive and curative health facilities which include women-centred, women-managed,safe and effective reproductive health care and affordable, accessible services, as appropriate, for the responsible planning of family size... [Ch. 6, Para. 6.26]

The health and well-being of all urban dwellers must be improved so that they can contribute to the economic and social development. [Ch. 6, Para.6.33]

As a first step towards the goal of providing adequate shelter for all, countries should take immediate measures to provide shelter to their homeless poor ... [Ch. 7, Para. 7.9 (a)]

All countries should ... Formulate appropriate land-use policies and introduce planning regulations specially aimed at the protection of eco-sensitive zones against physical disruption by construction and construction-related activities. [Ch. 7, Para. 7.69(d)]

Monitoring and evaluating the development process systematically, conducting regular reviews of the state of human resources development, economic and social conditions and trends, the state of the environment and natural resources; [Ch.8, Para. 8.4(d)]

Laws and regulations suited to country specific conditions are among the most important instruments for transforming environment and development policies into action, not only through "command and control" methods, but also as a normative framework for economic planning and market instruments. [Ch. 8, Para. 8.13]

...since the transport sector is also a source of atmospheric emissions, there is a need for a review of existing transport systems and for more effective design and management of traffic and transport systems. [Ch. 9, Para. 9.13]

THE ABOVE IS JUST A SMALL SAMPLING OF THE HUNDREDS OF PAGES CONTAINED IN AGENDA 21. ALREADY WE ARE SEEING MANY OF THE CALLED-FOR PROVISIONS BEING IMPLEMENTED IN OUR STATE (AND OTHER STATES ACROSS THE NATION). ONE REASON FOR THE PUSH TO CHANGE ALABAMA'S CONSTITUTION: IT WILL MAKE IT EASIER TO COMPLY WITH AGENDA 21 EDICTS!. . . "SUSTAINABLE DEVELOPMENT", "URBAN GROWTH BOUNDARIES" (UBGs), "COMPREHENSIVE PLANNING", "SMART GROWTH", ETC. ARE A FEW OF THE CODE WORDS YOU MAY HEAR CONNECTED WITH AGENDA 21 IMPLEMENTATION EFFORTS. THE NEW WORLD ORDER IS IN YOUR BACKYARD NOW.

View Full Version: TV adverts for commercial abortion clinics given

Title: TV adverts for commercial abortion clinics given
Description: *go ahead [DOWNRIGHT LUCIFERIAN]*

TheUnhivedMind - July 3, 2011 01:43 AM (GMT)

TV adverts for commercial abortion clinics given go ahead

Private clinics which carry out abortions will be allowed to advertise on television and radio for the first time, under new rules.

By Laura Donnelly, and Jonathan Wynne-Jones
9:00PM BST 02 Jul 2011
http://www.telegraph.co.uk/health/healthne...n-go-ahead.html

The plans have sparked controversy, with pro-life campaigners accusing advertising authorities of "trivialising" human life by treating terminations as a consumer choice like cars or washing powder.

They emerged as a report accused clinics of using "hard sell" marketing to push pregnant women seeking counselling into having terminations, in order to make more money.

Under the draft recommendations, drawn up by the Broadcast Committee of Advertising Practice, which regulates TV and radio commercials, dozens of independent hospitals carrying out abortions will be able to advertise their services to consumers.

Until now, restrictions have meant abortion clinics can only advertise their services if they are not run for profit. Because of the rules, just one advert, by charity Marie Stopes International has ever been aired, last year, to great controversy, and more than 4,500 complaints.

Last night Sally Taber from Independent Healthcare Advisory Services, which represents private healthcare organisations, said clinics offering terminations would

welcome the change - though not all would choose to advertise, given the risk of negative publicity.

More than 35 private hospitals in England currently offer abortion services, though many are better known for their maternity and fertility services.

She said: "We would definitely welcome this, clearly hospitals want to raise awareness of services they provide, but some might choose not to advertise because of the sensitivity of the service - we have seen the problems in other countries when abortion clinics come under attack. Each provider will need to think this through very carefully."

Last night Joanne Hill, from the pro-life charity Life expressed "utter disbelief" at the recommendations, which she described as unacceptable.

She said: "To allow commercial abortion providers to advertise on TV, as though they were no different from car companies or detergent manufacturers, is shocking and exceeds the bounds of responsible advertising.

"By suggesting that abortion is yet another consumer choice human life is trivialised and the distress and heartache faced by a woman making this irrevocable decision, which ends the life of her child, is glossed over."

The proposals emerged as campaigners for changes to abortion law publish a report accusing clinics funded by the NHS of using "hard sell" tactics to pressure women into having abortions.

The report by lobby group Right To Know attacks major abortion providers for recruiting business development managers who are asked to promote the growth of the businesses, and generate increased income.

It quotes financial statements from abortion provider bpas which list increases in the number of terminations as significant goals achieved.

The group is campaigning for an amendment to the health and social care bill, now going through parliament, proposed by MPs Nadine Dorries and Frank Field so, that all women considering abortion are offered counselling by independent organisations - not by a clinic providing the termination.

Their report, published tomorrow, says that organisations like bpas, which combine counselling with a medical assessment, to find out which method of abortion is suitable, put pressure on women to go ahead with a termination.

Mrs Dorries said: "Ultimately the woman should have the right to make her own choice, but often they are not given all the information they should be given regarding the abortion process.

"The marketing techniques are so slick that many women are coming out of the process feeling as though they were rushed through it and given no choice."

It has emerged that the British Association for Counselling and Psychotherapists, which represents over 32,000 individual and organisational members is supporting the Dorries/ Field amendment.

The body is calling for all women considering terminations to be offered free, independent unbiased advice, to help them come to terms with the psychological consequences of their decisions.

The new code for TV and radio advertising, on which consultation began last week, has also angered pro-life groups because it says that if they run commercials promoting services offering counselling to pregnant women, they must make explicit the fact they would not refer for terminations.

Josephine Quintavelle, from the Pro-Life Alliance accused regulators of "weaselly game playing" in making the demand.

Ann Furedi, chief executive of bpas said: "Bpas is a charity that promotes choice; we have no interest - financial or otherwise - in encouraging women to have abortions.

"The implication that our doctors and nurses are unable to counsel women about all their pregnancy options is ill-informed and offensive."

TheUnhivedMind - July 2, 2011 03:29 AM (GMT)

India: Rajasthan in 'cars for sterilisation' drive

Couples are being urged to opt for Tata Nanos rather than babies

1 July 2011 Last updated at 08:27
http://www.bbc.co.uk/news/world-south-asia-13982031

Health officials in the Indian state of Rajasthan are launching a new campaign to try reduce the high population growth in the area.

They are encouraging men and women to volunteer for sterilisation, and in return are offering a car and other prizes for those who come forward.

Among the rewards on offer is the Indian-made Tata Nano - the world's cheapest car.

Many in the government are worried about the size of India's population.

It is expected to overtake that of China by 2030.

Sitaram Sharma, the head doctor of Jhunjunu in western India, is hopeful that the chance to win a car might be just enough to tempt at least 20,000 men and women to undergo sterilisation.

He is also offering motorcycles, televisions and food blenders.

The offer is open to all Indians and not just residents of his drought-prone region.

Other regions have also offered incentives for couples volunteering for sterilisation.

A nationwide campaign was abandoned in the 1970s, however, after complaints that

thousands of men and women were forced into having the operation.

View Full Version: Mother walks free from court after strangling

Title: Mother walks free from court after strangling
Description: *autism son with belt*

TheUnhivedMind - July 1, 2011 05:55 PM (GMT)

Mother walks free from court after strangling autistic son with belt

A mother who strangled her autistic son because she could no longer cope with looking after him has walked free from court.

12:23PM BST 01 Jul 2011
http://www.telegraph.co.uk/news/uknews/861...-with-belt.html

Yvonne Freaney, 50, admitted she killed her son Glen, 11, with a coat belt in an airport hotel room.

Freaney told police she killed Glen so "no one could point fingers at him" when he was in heaven.

Mother-of-four Freaney also tried to kill herself but botched her attempts to slash her wrists - and was found alive by ambulance crews.

She was cleared of murder but admitted manslaughter by diminished responsibility. Judge Mr Justice Wyn Williams allowed her to walk free with a supervision order.

He said it was "the most difficult sentencing" he had ever had in his career.

Mr Justice Wyn Williams told her: "You have already been punished enough.

"The only sensible and credible explanation is that your state of mind was truly abnormal.

"At the end you genuinely but irrationally believed that no-one but you could care for Glen and, since you were intent on killing himself, you had to kill him first.

"Not withstanding the fact that your crime was to kill a child, your culpability was very low.

"There could be no doubts you were completely devoted to Glen throughout his short life and showered him with love and affection.

"You cared for him with the best of your ability, day in and day out. He was very demanding but you never let that deflect from putting his best interests above those of your own."

John Charles Rees, defending, said: "She was undoubtably a loving mother to all her children and killed Glen out of love not malice.

"There was never any dispute as to the facts of this case. The issue was a medical one. She was suffering from a personality disorder.

"This is a wholly exceptional case we've heard, for reasons quite a distressing and haunting.

"She went through experiences that no one should ever have to go through.

"She needs to be reintroduced into the community and back into her family, that can't happen over night but can happen in a supervised and controled way.

Freaney was discovered in the Sky Plaza hotel room near Cardiff Airport with multiple knife wounds after a botched suicide attempt.

As she was being arrested, Freaney said: "He was laughing when I was strangling him. That is when I knew he was happy.

"I had to do it because now no-one can point fingers at him. He is in heaven now.

"I killed him. I was frightened about who would look after him."

The court heard "loving and devoted" Freaney was facing a lifetime of one-to-one caring for Glen after the breakdown of her abusive marriage.

The jury heard how Glen could walk, run and ride a bike and communicated through a computer by tapping on symbols on the screen. But he was not toilet trained and still wore nappies.

Prosecutor Greg Taylor QC said: "Glen was a young boy who suffered from severe autism - he was diagnosed when he was aged four.

"He was generally fit and well and had a normal life expectancy but he was totally

dependent on adult care.

"He needed help, dressing, washing, brushing his teeth and feeding."

Mr Taylor told the court Freaney and her husband Mark had a marriage "filled with problems" and she moved out of the family home about a month before Glen's death.

The jury was told how 17-stone former RAF serviceman Mark attacked his wife on numerous occasions at their home in Barry, South Wales.

Police were called several times to the family home after alleged domestic violence. Freaney was examined by doctors for injuries but never pressed charges against her husband.

The court heard Mr Freaney had told social services: "I'm a wife beater and proud of it. She deserves it."

Freaney must be supervised by the probation service, attend mental health meetings, live in approved accommodation and not have contact with children under 18 without supervision.

Following the trial Freaney's husband Mark called Glen's death "a tragedy".

He said: "The outcome of the trial, whatever the verdict reached will not bring Glen back to us.

"The tragedy of his death still causes us great pain. He was a wonderful friendly boy and very much loved by us all and we miss him deeply."

Her daughter Carla said: "I want to take this opportunity to thank everyone who has helped and supported us through this very hard time.

"The conclusion of the trial will help give closure for us all and allow us to move on. I love my mother and will remain supportive of her."

Detective Chief Inspector Richard Jones said: "Any investigation into the death of a child is distressing for everyone involved.

"This was a very difficult case but it was only correct that the facts were presented at court. We note the decision of the court today and extend our sympathies to the family."

Could food-packaging chemical rob men of their sex appeal?

Last updated at 8:07 AM on 29th June 2011
http://www.dailymail.co.uk/health/article-.../Male-mice.html

A gender-bending chemical found in food packaging may reduce a man's ability to attract a female, researchers warn.

A study from the University of Missouri found male mice who were exposed to bisphenol A as babies became demasculanised and 'behaved more like females.'

Study author associate professor Cheryl Rosenfeld, said the chemical had suppressed the early production of testosterone, which the females could sense.

Relationship trouble? A study in male mice found exposure to the chemical BPA could turn off females later in life

'The BPA-exposed deer mice in our study look normal; there is nothing obviously wrong with them. Yet, they are clearly different,' she said.

'Females do not want to mate with BPA-exposed male deer mice, and BPA-exposed males perform worse on spatial navigation tasks that assess their ability to find female partners in the wild. '

The research could have implications on how BPA affects human development and behaviour.

'These findings presumably have broad implications to other species, including

humans, where there are also innate differences between males and females in cognitive and behavioral patterns,' Rosenfeld said.

'Whether there are comparable health threats to humans remains unclear, but there clearly must be a concern.'

Bisphenol A, or BPA, which is used to harden plastics, is one of the world's most widely manufactured chemicals and can be found in dozens of everyday items including baby bottles, CD cases and food and drink packaging.

Because the chemical mimics oestrogen, many scientists believe it interferes with the way hormones are processed by the body.

Although several animal studies have shown it to be safe, others have linked Bisphenol A to breast cancer, liver damage, obesity, diabetes and fertility problems.

In the study, female deer mice were fed BPA-supplemented diets two weeks prior to breeding and throughout lactation.

The mothers were given a dosage equivalent to what the U.S. Food and Drug Administration considers a non-toxic dose and safe for mothers to ingest.

At weaning the deer mice offspring were placed on a non-supplemented BPA diet and their behavior tested when they matured into adults.

Male deer mice exposed to BPA were less desirable to female deer mice, who literally turned their noses up at them. This meant the females did not consider them genetically suitable mates.

'We can use this evolutionary approach to the study of BPA to determine to best way to assess differences in the risks to boys and girls to early exposure to this chemical,' said David Geary MU Curators' Professor of Psychological Sciences.

The study was published in the Proceedings of the National Academy of Sciences.

Legally killed: 21 dementia victims given lethal injections by Dutch doctors in 2010

Last updated at 8:03 AM on 29th June 2011
http://www.dailymail.co.uk/news/article-20...ctors-2010.html

Dementia sufferers are being killed by doctors in Holland under the country's euthanasia laws, official figures are to reveal.

A total of 21 patients with early-stage dementia, including Alzheimer's, died by lethal injection last year, according to a forthcoming annual report.

This is the first time dementia sufferers have been included in the country's euthanasia statistics.

None of the cases is thought to have involved any illegal act on the part of health professionals, and each time the patient was considered capable of giving their consent.

But the figures have caused alarm among critics who say the pool of patients who qualify for euthanasia in the Netherlands is expanding.

The figures, which are due to be formally released later in the summer, were leaked on NOS, the state television news channel.

The NOS report included video footage of Alzheimer's sufferer Guusje de Koning, 63, explaining to her children why she wanted to die at the hands of her doctor.

She said she had witnessed her own father's slow decline and death through the illness, adding: 'I don't want that. I don't want to suffer.'

Euthanasia advocates are using her story to promote the idea that euthanasia for dementia sufferers is a suitable way to avoid suffering and the expensive healthcare.

A series of public meetings have been held over the last year to encourage the elderly to learn about their ‘right’ to die, even if they are in good health but afraid of what might happen if they are diagnosed with dementia in the future.

But the practice of assisted suicide for dementia patients remains controversial. While some 95 per cent of Holland’s population support the country’s euthanasia laws, only 33 per cent of Dutch doctors agree with offering lethal injections to dementia sufferers.

Phyllis Bowman of Right to Life, a British pro-life pressure group, said: ‘I think the figures are frightening and we have every reason to be afraid.

‘That people are putting themselves forward for death so early suggests that there has been quite a bit of pressure put on them.’

Defenders of the practice argue, however, that all 21 patients gave their consent.

The 2010 figures also show another year-on-year rise in cases, with 2,700 people choosing to die by injection, compared to 2,636 the year before.

To qualify for euthanasia, patients must convince two doctors they are making an informed choice in the face of unbearable suffering.

IVF BABIES ABORTED

More than 700 women have had abortions while pregnant through IVF

Sunday June 26,2011
By Sunday Express Reporter
http://www.express.co.uk/posts/view/255031...babies-aborted-

MORE than 700 women have had abortions while pregnant through IVF, Britain's fertility watchdog has revealed, writes Matthew Davis.

Most terminations were within weeks of the test-tube baby being implanted after a change of heart by the mothers.

A small number were due to medical complications, said the Human Fertilisation and Embryology Authority (HFEA).

Up to 50 IVF babies are terminated each year as well as a smaller number of abortions for women who used other fertility treatments such as donor insemination. In the 19 years since the HFEA has kept statistics, 749 IVF pregnancies have been aborted.

The figure, revealed last week following a freedom of information request, will shock many because of the thorough medical procedures women undergo with IVF.

Half the terminations were a result of relationship breakdowns or fears over motherhood. The most common medical reasons were Downs Syndrome and foetal abnormalities.

Josephine Quintavalle, of campaign group Comment on Reproductive Ethics, said: "A baby is not a designer object to be rejected on second thought."

Dark Past: Michigan sterilized more than 3,000 people from early 1900s to 1970s

Published: Thursday, June 23, 2011
http://www.mlive.com/news/index.ssf/2011/0...sterilized.html

While North Carolina is reliving some of its dark history, Michigan is not without its own.

Michigan was among the 35 states that allowed sterilization of people considered unfit to reproduce.

The stories of dozens North Carolina victims are coming to national prominence after people came forward to speak at a public hearing seeking compensation.

According to The Wall Street Journal, the North Carolina government has a legislative proposal to compensate sterilized people with $20,000 each.

Victims have said they were lied to about the procedure. About 7,600 people in North Carolina were sterilized over five decades, and about 3,000 of those people are still alive, according to CNN.

Michigan shares in the eugenics horror often associated with Nazis, as more than 3,000 residents were involuntarily sterilized, according to a January 2009 document from the Michigan Supreme Court Historical Society.

Eugenics is the process of selectively breeding humans and animals to get rid of undesirable characteristics.

Michigan repealed the sterilization law in 1974, the historical society reported.

In the 1990s, a man named Fred Aslin brought a suit against the state in 1994 because of his sterilization 50 years before at the age of 18.

The case was dismissed because the statute of limitations, and Aslin received a formal apology from the Michigan Department of Community Health.

He was an American Indian from the Upper Peninsula, and Aslin and several of his siblings were considered “feeble-minded.”

They were taken to the Lapeer State School, a former psychiatric facility, after their father died and mother was unable to take care her children, according to commondreams.org.

View Full Version: Al Gore, Agenda 21 And Population Control

Title: Al Gore, Agenda 21 And Population Control

TheUnhivedMind - June 26, 2011 01:56 AM (GMT)

Al Gore, Agenda 21 And Population Control

June 24, 2011
By: Michael Snyder - BLN Contributing Writer

Imagine going to sleep one night and waking up many years later in a totally different world. In this futuristic world, literally everything you do is tightly monitored and controlled by control freak bureaucrats in the name of “sustainable development” and with the goal of promoting “the green agenda”. An international ruling body has centralized global control over all human activity. What you eat, what you drink, where you live, how warm or cold your home can be and how much fuel you can use is determined by them. Anyone that dissents or that tries to rebel against the system is sent off for “re-education”. The human population is 90 percent lower than it is today in this futuristic society, and all remaining humans have been herded into tightly constricted cities which are run much like prisons. Does all of that sound good to you? Well, this is what Agenda 21 is all about.

Yes, I know all this sounds like a plot from a science fiction novel. But it is actually real. 178 nations have signed on to Agenda 21. “Eco-prophets” such as Al Gore travel all over the world teaching us how wonderful “sustainable development” will be. This agenda is being pushed in our schools, at our universities, on our televisions and in our movies.

So exactly what is Agenda 21? The following is how the United Nations defines Agenda 21….

Agenda 21 is a comprehensive plan of action to be taken globally, nationally and locally by organizations of the United Nations System, Governments, and Major Groups in every area in which human impacts on the environment.

When you start doing deep research into Agenda 21, you will find that describing it as a “comprehensive plan” is an understatement. Virtually all forms of human activity impact the environment. The rabid “environmentalists” behind the green agenda intend to take all human activity and put it into a box called “sustainable development”.

One of the key elements of “sustainable development” is population control. The United Nations (along with radical “environmental” leaders such as Al Gore) actually believes that there are far too many people on earth.

So what is the solution?

Sadly, they actually believe that we need to start reducing the population.

Just this week, Al Gore made the following statement regarding population control….

“One of the things we could do about it is to change the technologies, to put out less of this pollution, to stabilize the population, and one of the principle ways of doing that is to empower and educate girls and women. You have to have ubiquitous availability of fertility management so women can choose how many children have, the spacing of the children.

You have to lift child survival rates so that parents feel comfortable having small families and most important — you have to educate girls and empower women. And that’s the most powerful leveraging factor, and when that happens, then the population begins to stabilize and societies begin to make better choices and more balanced choices.”

Do you notice how whenever global leaders talk about “empowering” women these days it always ends up with them having less children?

This population control agenda is also reflected in official UN documents.

The following is language from a UN resolution that was adopted by the UN General Assembly that was designed to further the implementation of Agenda 21….

“….population growth rates have been declining globally, largely as a result of expanded basic education and health care. That trend is projected to lead to a stable world population in the middle of the twenty-first century… The current decline in population growth rates must be further promoted through national and international policies that promote economic development, social development, environmental protection, and poverty eradication, particularly the further expansion of basic education, with full and equal access for girls and women, and health care, including reproductive health care, including both family planning and sexual health, consistent with the report of the International Conference on Population and Development.”

Most Americans don't grasp it yet, but the truth is that the global elite are absolutely obsessed with population control. In fact, there is a growing consensus among the global elite that they need to get rid of 80 to 90 percent of us.

The number one commandment of the infamous Georgia Guidestones is this: "Maintain humanity under 500,000,000 in perpetual balance with nature."

Unfortunately, a very high percentage of our global leaders actually believe in this stuff. Sadly, this philosophy is now regularly being reflected in official UN documents. For example, the March 2009 U.N. Population Division policy brief begins with the following shocking statement….

What would it take to accelerate fertility decline in the least developed countries?

Apparently the poorest nations are the primary target for the population control freaks over at the UN.

This agenda showed up again when the United Nations Population Fund released its annual State of the World Population Report for 2009 entitled "Facing a Changing World: Women, Population and Climate".

The following are three quotes that were pulled right out of that document….

1) "Each birth results not only in the emissions attributable to that person in his or her lifetime, but also the emissions of all his or her descendants. Hence, the emissions savings from intended or planned births multiply with time."

2) "No human is genuinely "carbon neutral," especially when all greenhouse gases are figured into the equation. Therefore, everyone is part of the problem, so everyone must be part of the solution in some way."

3) "Strong family planning programmes are in the interests of all countries for greenhouse-gas concerns as well as for broader welfare concerns."

If no human is "carbon neutral", then what is the solution?

To those that are obsessed with Agenda 21 and "sustainable development", the fact that you and I are alive and breathing air is a huge problem.

The population control agenda is also regularly showing up in our newspapers now.

In a recent editorial for the New York Times entitled "The Earth Is Full", Thomas L. Friedman made the following statement….

You really do have to wonder whether a few years from now we'll look back at the first

decade of the 21st century — when food prices spiked, energy prices soared, world population surged, tornados plowed through cities, floods and droughts set records, populations were displaced and governments were threatened by the confluence of it all — and ask ourselves: What were we thinking? How did we not panic when the evidence was so obvious that we'd crossed some growth/climate/natural resource/ population redlines all at once?

But Friedman is quite moderate compared to many of the "eco-prophets" that are running around out there today.

For example, James Lovelock, the creator of the Gaia hypothesis, stated in an interview with the Guardian earlier this year that "democracy must be put on hold" if the fight against global warming is going to be successful and that only "a few people with authority" should be permitted to rule the planet until the crisis is solved.

A Finnish environmentalist named Pentti Linkola has gone even farther than that. Linkola is openly calling for climate change deniers to be "re-educated", for an eco-fascist world government to be established, for humans to be forcibly sterilized and for the majority of humans to be killed.

That doesn't sound pleasant, now does it?

This agenda is even being taught by professors at our top universities.

The truth is that academia is brimming with nutjobs who want to see the vast majority of humans wiped out.

For example, Professor of Biology at the University of Texas at Austin Eric R. Pianka is a very prominent advocate of radical human population control.

In an article entitled "What nobody wants to hear, but everyone needs to know", Pianka made the following shocking statements….

*First, and foremost, we must get out of denial and recognize that Earth simply cannot support many billions of people.

*This planet might be able to support perhaps as many as half a billion people who could live a sustainable life in relative comfort. Human populations must be greatly diminished, and as quickly as possible to limit further environmental damage.

*I do not bear any ill will toward humanity. However, I am convinced that the world WOULD clearly be much better off without so many of us.

Now keep in mind that this is a university professor that is teaching our kids. People actually pay a lot of money to get educated by this guy.

If those pushing Agenda 21, “sustainable development” and population control get their way, the world is going to be a much different place in the future.

Just watch the video posted below. It was originally produced by the Forum for the Future, a major NGO funded by big corporations such as Time Warner and Royal Dutch Shell. In this video, the Forum for the Future presents their chilling version of the future. Are you ready to live in a “Planned-opolis”? Are you ready to use a “calorie card” and to have what you eat determined by a “global food council”? This is the kind of tyrannical future that these radical environmental organizations want to impose on you and I….

[dohtml]<object style="height: 390px; width: 640px"><param name="movie" value="http://www.youtube.com/v/Q966tz9aEHM?version=3"><param name="allowFullScreen" value="true"><param name="allowScriptAccess" value="always"><embed src="http://www.youtube.com/v/Q966tz9aEHM?version=3" type="application/x-shockwave-flash" allowfullscreen="true" allowScriptAccess="always" width="640" height="390"></object>[/dohtml]

Yes, the video is almost comical, but this is the kind of world that the global elite want to push us towards.

In fact, we see radical steps being taken all over the globe even now.

In Europe, the European Commission has unveiled a plan to ban all cars from major European cities by the year 2050.

In Europe, the mantra “carbon dioxide is causing global warming” has become gospel. This banning of cars from city centers is all part of a draconian master plan to reduce carbon dioxide emissions in Europe by 60 percent over the next 40 years.

Hopefully this plan will never come to fruition, but the fact that the European Commission is seriously pushing it just shows how far things have progressed.

But we don’t have to peer into the future to see how this agenda is going to affect us.

Today, the U.S. government and governments all over the industrialized world have become so obsessed with reducing carbon emissions that now they even tell us what kinds of light bulbs we are allowed to buy.

There are millions of Americans that love the old light bulbs. But soon we will not have the choice to buy them anymore.

What kind of freedom is that?

In some areas of the United States, government snoopers actually sort through the

trash of residents to ensure that environmental rules are being followed. For example, in the city of Cleveland, Ohio authorities have announced plans to have “trash supervisors” go snooping through trash cans to ensure that people are actually recycling according to city guidelines.

How would you feel if government officials went snooping around in your trash cans?

The world is changing. The global elite have immense amounts of wealth and power and they are intent on imposing a radical environmental agenda on all the rest of us.

The reality is that many of the wealthiest and most prominent people in the world are absolutely obsessed with the green agenda and with population control. Just consider the following quotes….

David Rockefeller: “The negative impact of population growth on all of our planetary ecosystems is becoming appallingly evident.”

CNN Founder Ted Turner: “A total population of 250-300 million people, a 95% decline from present levels, would be ideal.”

Dave Foreman, Earth First Co-Founder: “My three main goals would be to reduce human population to about 100 million worldwide, destroy the industrial infrastructure and see wilderness, with it’s full complement of species, returning throughout the world.”

Maurice Strong: “Isn’t the only hope for the planet that the industrialized civilizations collapse? Isn’t it our responsibility to bring that about?”

Michael Oppenheimer: “The only hope for the world is to make sure there is not another United States. We can’t let other countries have the same number of cars, the amount of industrialization, we have in the US. We have to stop these Third World countries right where they are.”

This radical agenda is even represented in the White House.

John P. Holdren, Barack Obama’s top science advisor, co-authored a textbook entitled “Ecoscience” back in 1977 in which he actually advocated mass sterilization, compulsory abortion, a one world government and a global police force to enforce population control.

On page 837 of Ecoscience, a claim is made that compulsory abortion would be perfectly legal under the U.S. Constitution….

“Indeed, it has been concluded that compulsory population-control laws, even including laws requiring compulsory abortion, could be sustained under the existing Constitution if the population crisis became sufficiently severe to endanger the society.”

On pages 942 and 943, a call is made for the creation of a “planetary regime” that would control the global economy and enforce population control measures….

“Perhaps those agencies, combined with UNEP and the United Nations population agencies, might eventually be developed into a Planetary Regime—sort of an international superagency for population, resources, and environment. Such a comprehensive Planetary Regime could control the development, administration, conservation, and distribution of all natural resources, renewable or nonrenewable, at least insofar as international implications exist. Thus the Regime could have the power to control pollution not only in the atmosphere and oceans, but also in such freshwater bodies as rivers and lakes that cross international boundaries or that discharge into the oceans. The Regime might also be a logical central agency for regulating all international trade, perhaps including assistance from DCs to LDCs, and including all food on the international market.”

“The Planetary Regime might be given responsibility for determining the optimum population for the world and for each region and for arbitrating various countries’ shares within their regional limits. Control of population size might remain the responsibility of each government, but the Regime would have some power to enforce the agreed limits.”

On page 917, the surrender of U.S. national sovereignty to an international organization is advocated….

“If this could be accomplished, security might be provided by an armed international organization, a global analogue of a police force. Many people have recognized this as a goal, but the way to reach it remains obscure in a world where factionalism seems, if anything, to be increasing. The first step necessarily involves partial surrender of sovereignty to an international organization.”

As mentioned earlier, Holdren is the number one science advisor to Barack Obama, and the truth is that the top levels of the U.S. government are packed with people that believe this stuff.

Yes, a lot of what you have read in this article sounds crazy. But the global elite really do believe in population control and they really are seeking to implement a radical environmental agenda across the entire planet.

They want total control of everyone and everything so that they can impose the measures that they believe are necessary to “fix” the planet.

I have actually written quite extensively in the past about the radical green agenda of the global elite. If you are interested in learning more, I would recommend the following articles….

*The Green Police

*Governments Around The World Are Eagerly Adopting The Strict Population Control Agenda Of The United Nations

Description: *Agenda 21?*

TheUnhivedMind - June 26, 2011 01:47 AM (GMT)

Does The New ‘White House Rural Council’ = UN’s Agenda 21?

June 23, 2011
By Mike Opelka
http://www.theblaze.com/blog/author/mikeopelka/

On June 9, 2011, President Obama signed his 86th Executive Order, and almost nobody noticed.

(For the record, Obama is on par to match President Bush’s 291 orders executed during his two terms in office. The National Archives defines an Executive Order this way; Executive orders are official documents, numbered consecutively, through which the President of the United States manages the operations of the Federal Government.)

President Obama’s E.O. 13575 is designed to begin taking control over almost all aspects of the lives of 16% of the American people. Why didn’t we notice it? Weinergate. In the middle of the Anthony Weiner scandal, as the press and most of the American people were distracted, President Obama created something called “The White House Rural Council” (WHRC).

Section One of 13575 states the following:

Section 1. Policy. Sixteen percent of the American population lives in rural counties. Strong, sustainable rural communities are essential to winning the future and ensuring American competitiveness in the years ahead. These communities supply our food, fiber, and energy, safeguard our natural resources, and are essential in the development of science and innovation. Though rural communities face numerous challenges, they also present enormous economic potential. The Federal Government

has an important role to play in order to expand access to the capital necessary for economic growth, promote innovation, improve access to health care and education, and expand outdoor recreational activities on public lands.

Warning bells should have been sounding all across rural America when the phrase “sustainable rural communities” came up. As we know from researching the UN plan for Sustainable Development known as Agenda 21, these are code words for the true fundamental transformation America.

The third sentence also makes it quite clear that the government intends to take greater control over “food, fiber, and energy.”

The last sentence in Section 1 further clarifies the intent of the order by tying together “access to the capital necessary for economic growth, health care and education.”

The new White House Rural Council will probably be populated by experts in the various fields that might prove helpful to the folks who live and work outside of large urban areas, right? Well, Tom Vilsack, the current Secretary of Agriculture, will chair the group, but let us review the list of members appointed to serve on this new council – according to the order, the heads of the following groups have been appointed:
(1) the Department of the Treasury; Timothy Geithner
(2) the Department of Defense; Robert Gates
(3) the Department of Justice; Eric Holder
(4) the Department of the Interior; Ken Salazar
(5) the Department of Commerce; Gary Locke
(6) the Department of Labor; Hilda Solis
(7) the Department of Health and Human Services; Kathleen Sebelius
(8) the Department of Housing and Urban Development; Shaun Donovan
(9) the Department of Transportation; Ray LaHood
(10) the Department of Energy; Dr. Steven Chu
(11) the Department of Education; Arne Duncan
(12) the Department of Veterans Affairs; Eric Shinseki
(13) the Department of Homeland Security; Janet Napolitano
(14) the Environmental Protection Agency; Lisa Jackson
(15) the Federal Communications Commission; Michael Copps
(16) the Office of Management and Budget; Peter Orszag
(17) the Office of Science and Technology Policy; John Holdren
(18) the Office of National Drug Control Policy; R. Gil Kerlikowske
(19) the Council of Economic Advisers; Austan Goolsbee
(20) the Domestic Policy Council; Melody Barnes (former VP at Center for American Progress)
(21) the National Economic Council; Gene B. Sperling
(22) the Small Business Administration; Karen Mills
(23) the Council on Environmental Quality; Nancy Sutley

(24) the White House Office of Public Engagement and Intergovernmental Affairs; Valerie Jarrett
(25) the White House Office of Cabinet Affairs; and such other executive branch departments, agencies, and offices as the President or Secretary of Agriculture may, from time to time, designate. Chris Lu (or virtually anyone to be designated by the 24 people named above)

It appears that not a single department in the federal government was excluded from the new White House Rural Council, and the wild card option in number 25 gives the president and the agriculture secretary the option to designate anyone to serve on this powerful council.

Within the twenty-five designated members of the council are some curious ties to Agenda 21 and the structure being built to implement it:

Valerie Jarrett from the White House Office of Public Engagement and Intergovernmental Affairs served on the board of something called Local Initiatives Support Corportation (LISC). LISC uses the language of Agenda 21 and ICLEI as their web page details their work to build “Sustainable Communities.”

Melody Barnes head of the Domestic Policy Council – Former VP at George Soros-funded Center for American Progress.

Hilda Solis from the Labor Dept – in 2000 received an award for her work on “Environmental Justice.”

Nancy Sutley head of the White House Council on Environmental Quality – Served on the board of the Los Angeles Metropolitan Water District and was one of the biggest supporters of low-flow toilets that are now credited with costing more money than expected while causing some nasty problems.

Is it possible that concerns about 13575 are just typical anti-government paranoia? Let us review the mission and function of WHRC:

Sec. 4. Mission and Function of the Council. The Council shall work across executive departments, agencies, and offices to coordinate development of policy recommendations to promote economic prosperity and quality of life in rural America, and shall coordinate my Administration’s engagement with rural communities.

“Economic prosperity” and a better “quality of life,” that all sounds fairly innocent and well-intentioned. But continuing deeper into the order we find the council is charged with four directives:

(a) make recommendations to the President, through the Director of the Domestic Policy Council and the Director of the National Economic Council, on streamlining and

leveraging Federal investments in rural areas, where appropriate, to increase the impact of Federal dollars and create economic opportunities to improve the quality of life in rural America;

The vague language here sounds non-threatening. But, is there a hint here that a “rural stimulus plan” might be in the making? Will the Federal government start pumping money into farmlands under the guise of creating “economic opportunities to improve the quality of life in rural America?” It is difficult to discern as the language is so broad.

We continue with the functions of the WHRC:

(B) coordinate and increase the effectiveness of Federal engagement with rural stakeholders, including agricultural organizations, small businesses, education and training institutions, health-care providers, telecommunications services providers, research and land grant institutions, law enforcement, State, local, and tribal governments, and nongovernmental organizations regarding the needs of rural America;

Virtually every aspect of rural life seems to now be part of the government’s mission. And while all of the items in (B) sound like typical government speak, you should be alarmed when you read the words “nongovernmental organizations” (NGOs). NGOs are unelected, but typically government-funded groups that act like embedded community organizers. And NGOs are key to Agenda 21′s plans.

Continuing:

© coordinate Federal efforts directed toward the growth and development of geographic regions that encompass both urban and rural areas;

That one sounds very similar to the language found in the United Nations plan for sustainable cities known as Agenda 21. Managing the population in both rural and urban areas, with a focus on controlling “open spaces.”

(d) and identify and facilitate rural economic opportunities associated with energy development, outdoor recreation, and other conservation related activities.

This function of Executive Order 13575 ties energy development with outdoor recreation and “other conservation related activities.” When did outdoor recreation become a conservation related activity?

Aside from the content of this order and some its vague intentions, the timing of the signing should also be considered. Later this month, Washington DC is hosting a meeting of the Agenda 21 operatives who are members of ICLEI:

Washington, D.C. – ICLEI-Local Governments for Sustainability USA (ICLEI USA) and U.S. Green Building Council (USGBC) today announced the launch of the National

Press Club Leadership Speaker Series to be held on June 28. The event’s inaugural keynote speaker will be the Honorable Sha Zukang, Secretary-General of the United Nations Conference on Sustainable Development (Rio+20), whose keynote address, The Road to Rio+20, will explain the role of key global and national stakeholders, and the impact and vision of this historic conference.

As Secretary-General of Rio+20, Ambassador Sha Zukang will convene high-ranking leaders from government, the private sector and civil society to chart a pathway to accelerate the implementation of sustainable development decisions and the green economy through the creation of an institutional framework and inclusive participation.

The United Nations has pushed their sustainable development program for almost twenty years. The UN’s “social justice” blueprint called Agenda 21 requires governments to control almost all aspects of an individual’s life, but has recently met with substantial resistance in America. Since The Blaze covered this topic and the story appeared on Glenn Beck’s Fox TV program, we have been inundated with reports from around the country about efforts to remove ICLEI and Agenda 21 from local governments.

Carroll County, Maryland: Starting in February, 2011, all five newly elected county commissioners, led by Richard Rothschild, voted to become the first county in the nation to end the ICLEI contract.

Amador County, California: The Mother Lode Tea Party lead the successful effort to remove ICLEI form Amador County.

Montgomery County, Pennsylvania: Activists Ruth Miller and Maggie Roddin have raised awareness that lead to the removal of ICLEI.

Edmond, Oklahoma: Molly Jenkins motivated 200 people to attend the city council meeting and demand action against ICLEI.

Las Cruces, New Mexico: continues to debate the issue, but rational voices are gaining momentum in the community.

Spartanburg, South Carolina: City Councilman Roger Nutt successfully directed the effort against the program and Spartanburg became the 6th community to kick out ICLEI in a vote of 6-0 by City Council (with one abstention).

There have also been anti-ICLEI rallies held in several cities this week, with more planned in the near future:

June 27, 11:30am-3:00pm
Exeter, NH, Exeter High School
June 27, 5:00pm-8:30pm
Galveston, TX, Galveston Convention Center
June 27, 8:30am-5:00pm
Ocean Shores, WA, Quinault Beach Resort and Casino
June 30, 1:00pm-5:00pm
San Francisco Bay Area, CA, TBD
June 30, 10:00am-5:00pm
West Long Branch, NJ, Monmouth University

There appears to be a developing, grass-roots movement to reject programs like Agenda 21. It remains to be seen if these groups might also reject a Washington-based control over rural lands, like the council created by Executive Order 13575.

As long as there’s not another Weinergate, maybe they’ll notice.

The Popemobile Is Going Green

Jun. 20 2011 - 7:25 am | 3,382 views | 0 recommendations | 0 comments
http://blogs.forbes.com/alexknapp/2011/06/...is-going-green/

In his encyclical Caritas in Veritate, Pope Benedict XVI came out forcefully in favor of environmental protection and sustainable economic development. In particular, he called for world leaders to focus on “countering harmful ways of treating the environment,” with a particular focus on the first world reducing its energy use and developing clean, alternative energies.

As if to underscore this idea, it’s been announced that the next “Popemobile” will be a hybrid. The design is to be based on the Mercedes M Class, which earlier this year was named one of Forbes’ “Best Green Cars for the Buck.” Apparently the Vatican was considering a pure electric car, but there was concern about being able to drive a distance in the hurry in case of a security situation. As it stands, the green Popemobile will be able to go for about 16 miles on its electric motor alone – not a bad feat at all.

The new Popemobile is expected to be complete sometime next year.

Be Free of Your Rights, Even Liberated From Life: Agenda 21 Comes Calling

Rand Clifford
Wednesday, June 22, 2011
http://www.activistpost.com/2011/06/be-fre...-liberated.html

United Nations Agenda 21 – Blueprint to Advance Sustainable Development . . . doesn't that sound nice? Who could be against sustainable development? Who doesn't care deeply about mother Earth? Let's save the world.

There's a catch. Many catches, actually, at least 22 of them, but one is worst of all: The redundant theme in official documentation that human population must be reduced by 90%.

Development of this New World Order (NWO) plan for Dark Ages Redux has slithered along in plain sight (for those who look) since 1987. But in the Obama Show, it's coiled and hissing.

Indispensable allies of the NWO are distraction, numbing, and dumbing-down of the mass American mind (MAM). For many people the Georgia Guidestones fundamentally convey the Ten Commandments of the NWO. Superficially fuzzy and warm, and smarmy to the core, the "commandments" do a reasonable job of cloaking the venom contained within. (1) And there's the massive concrete tombs in Arizona and California as well.

Agenda 21 is swaddled in euphemisms so warm and fuzzy that few Americans seem concerned about its fangs. In the simplest terms, Agenda 21 means total centralized global control over human life. No rights of property ownership . . . no rights at all. And

exactly how 90% of the population will be liberated from life is rather hazy; the only clear aspect is that it must happen.

Caskets stockpiled in growing millions by the Federal Emergency Management Agency (FEMA) are nothing to be ignored . . . though somehow, they almost are being ignored. With the Agenda 21 “blueprint” unfolding so matter-of-factly in broad daylight, that seems unbelievable...unless you consider crucial things about what the MAM tends to prefer to see....

In the most general terms at least, it could be said that Large minds think about ideas; Medium minds think about events; Small minds think about people. Or, a slightly different angle might suggest that Large minds think about solutions to problems while Medium minds mire in problems themselves, and Small minds watch TV and play with their gadgets.

On the basis of these generalities, things are not looking at all sizeable in terms of the MAM. Current mainstream obsession with things that congressmen do with their weiners is bad enough. Perhaps even worse is the apparent newsworthiness of the Wasilla loose moose, Alaskan reload mama and her Rolling Blunder East Coast bus tour. You know, where Paul Revere is Yosemite Sam in disguise...ring-a-ding-ding(bat) —KaPow! KaPow! KaPow! Back off, Redcoats! Hardly good indicators.

Damn embarrassing, actually.

The gravity of Agenda 21 makes it hard to write about without sounding alarmist, or eliciting groans and shouts of "conspiracy theory." But NWO alpha psychopaths are obsessed with power; ultimate power concentration, centralized control over all aspects of human life, mass murder . . . such is the grit behind the silky euphemisms like “Sustainable Development”, and the decoys, “Save the Earth” and “Green”! Agenda 21 warrants about a million times more public scrutiny than it seems to be getting; I hope to encourage more people to become aware of the program.

Of course it’s much easier to hide behind, “Oh, they’d never do that!” or shout “conspiracy theory!” or to simply play dumb . . . or be, dumb. But I think many Americans might be surprised, even shocked to know how far this thing has progressed, and they might be glad to read about it in the UN’s own doublespeak.

Again, specifics regarding how billions of people are going to be liberated from life never surface, but it doesn’t take much looking around to see what profound help the NWO has in achieving its goals.

Consider Fukushima.

If you think the official reports even approach the actual severity of the ongoing catastrophe, well, that's what mainstream corporate media (CorpoMedia) is for -- spreading official B.S. Perhaps the most important thing CorpoMedia teaches us is, as W.C. Fields liked to say, "There comes a time in the affairs of man when we must take the bull by the tail, and face the situation."

Fukushima is certainly, in the words of Dahr Jamail, the "Biggest industrial catastrophe in history." It's estimated that, with the three meltdowns, plus exposed "spent" fuel cores, the potential radiation release into the environment could be twenty times that of Chernobyl (Tokyo Electric Power Company officials have finally admitted to more radioactive release than Chernobyl, so imagine what has actually been released already). Almost 1000 square kilometers near Fukushima have been rendered uninhabitable, effectively forever. Some scientists warn that the whole country may become uninhabitable. Mutant rabbits and radioactive whales are already being reported.

It's been estimated that, following the explosions at Fukushima, the average person in Seattle was inhaling ten "hot particles" per day. It really only takes one hot particle shooting bullets at the chromosomes of nearby cells to sooner or later cause cancer.

At the same time there's been a 35% spike in infant mortality in such cities as Portland, Boise, San Francisco, San Jose, Sacramento, Berkeley, Santa Cruz, and Seattle. As far as being an ally of Agenda 21 population reductions . . . Fukushima is a gift that will just keep on giving, forever. And Fukushima has numerous partners in death.

So many major threats to life on Earth now simmer that a comprehensive listing is challenging. Seems any decent list should also mention that Hydra, Monsanto, and threats to global food supply posed by their genetically modified organisms (GMOs). That's right, Frankenfoods. Most of us eat them every day and don't even know . . . yet.

Also on the list . . . the next stage of global economic collapse, originally set in motion by such "high-finance" parasites as Goldman Sachs, that "...great vampire squid wrapped around the face of humanity, relentlessly jamming its blood funnel into anything that smells like money" (thank you for the realism, Matt Taibbi, and Rolling Stone). And there's the endless, expanding and accelerating imperial wars for dwindling resources—contained therein the hideously biocidal use of "depleted" uranium munitions (DU). Check out the explosion of birth defects especially around Fallujah since we gave freedom to the Iraqis. Remember "OIL" (Operation Iraqi Liberation)?

Deadly piles of nuclear waste around the country are a mountainous safe disposal problem—but lucky US! "Depleted" uranium not only makes superior armor-penetrating projectiles, but we've dented the disposal problem by shooting DU weapons all over areas inhabited by people we aim to liberate, and relieve of their resources. Two birds

with one stone.

Clash of religions, staged “revolutions”, vaccines and designer diseases, dumbing-down of populations . . . Agenda 21 is amassing many allies; might we call these death apparatuses “the coalition of the willing”? Or is that term under patent?

A potential new member of the coalition is the Fort Calhoun nuclear power plant about twenty minutes from downtown Omaha, Nebraska. Record flooding of the Missouri River caused “catastrophic loss of cooling” to one of the plant’s spent fuel pools on June 7. Apparently a “Level 4” emergency ensued—which would make it one of the worst nuclear accidents in US history. A fire at the plant prompted the Federal Aviation Agency (FAA) to declare a “no-fly ban” over the area. Sadly, current information regarding the "event" is sketchy since the Obama Show appears to have ordered a “total and complete” news blackout on the situation. Hardly a peep from CorpoMedia on this one, so far.

Tying the concept of environmentalism to this whole NWO agenda from hell seems preposterous enough, since realistically, Agenda 21 is about as far from true environmentalism as anything could possibly be. So, enriching the very concept of preposterous in classic NWO style would take something as shocking as . . . let’s say, the primary devotees of Agenda 21 being the same psychopaths that annihilate the biosphere for profit more savagely every day—nothing less diabolical would do.

Well, they did it, gave the very term preposterous fabulous new scope—YES, the psychopaths routinely profiting their way toward ruining the biosphere are top trumpeters of Agenda 21! Yet, astonishing as it may seem, “Oh, they’d never do that” peals, if not loudly, plenty clearly from the MAM. Rather reminiscent of 9/11....

Indeed, the same power-mad alpha reptiles most responsible for our DEAD END fossil fuel economy are the teeth, scales and claws behind “Save the Planet!” Agenda 21. Their maniacal consumption of resources, especially energy, cannot be maintained with so many people on their (the “elite’s”) planet competing for their resources. Only a liberation from life of 90% of the human population can safely preserve elite comfort zones. You know, those sprawling “gated communities” (secured compounds) sprinkled with golf courses and castles that seem the main nests for vulgar amounts of private jet and helicopter traffic. Appetite for actually healthy food, pure water, and elite-only consumables often demands more than cumbersome things like trucking. And of course the overclass is bursting with places to go, things to see and exploit.

Takes obscene amounts of starvation, polluted water, disease and liberation from life to support just one billionaire. Disgusting lengths of people misery. But, on the other hand, how could mere people ever relate to the suffering and despair upper millionaires endure over being less than a billionaire?

Something has to give. Sure looks like it won't be elite comfort zones. But frankly, the elite are behaving . . . scheming, manipulating, destroying the competition—they're doing exactly what they always have and always will. No surprise here whatsoever. Psychopaths have no conscience, no "humanity", only will to power. What is a surprise, though -- maybe it shouldn't be -- is that we people outnumber them nearly a million to one, but we won't wake up and smell the tyranny. The ultimate power is ours, yet they are ready to liberate from life 9 out of 10 of us primarily to perpetuate their pathetic and regressive comfort zones (humans should evolve, not devolve) . . . and through it all the MAM is sleeping.

The difference between what humans are capable of with visionary leadership, and the feudal, regressive, power-blinded ends hammered home by our entrenched pathocracy seem symbolic of heaven, and hell.

To wake up, how many more alarms do we need?

Rand Clifford lives in Spokane, Washington, with his wife Mary Ann, and the intellectual Chesapeake bay retriever, Mink. Rand and Mary Ann kicked television many years ago, and recommend others try it...a good way to help live life instead of watching moneypower's version of life. Reading is best for the mind. Four of Rand's novels, Castling, Timing, Priest Lake Cathedral, and Voices of Vires are published by StarChief Press, and will soon be available as e-books.

North Carolina Confronts the Ugly Past of Its Eugenics Law

Elaine Riddick Jesse can't forgive the state of North Carolina for sterilizing her in 1968. Winston-Salem Journal

by Asraa Mustufa ShareThis | Print | Comment (6)
Wednesday, June 15 2011, 12:39 PM EST Tags: eugenics, North Carolina
http://colorlines.com/archives/2011/06/nor...re_stories.html

A North Carolina state task force is holding a public listening session later this month for victims of the state's now defunct eugenics law to come forward and share their stories. The session is part of an effort to compensate those who were forcibly sterilized decades ago. The majority of victims were poor black women, and many were minors or the victims of rape or incest.

"The fewer black babies we have the better, that's what some people said," Professor Paul Lombardo told the BBC about the program. "They're just going to end up on welfare."

North Carolina is one of 32 states that passed laws that allowed the sterilization of people deemed "unfit to breed," and ultimately took away the reproductive rights of more than 60,000 people nationwide. The programs targeted people deemed to be criminals, juvenile delinquents, the mentally ill, women considered to be "sexual deviants," gay men, and people suffering from epilepsy. Those on welfare were targeted as well, especially African Americans after welfare became available to them in the 1960s, because they were seen as a drain on the system.

Operations were often done without the victim's knowledge. Sterilization was also

sometimes used as a condition for release from prison or a hospital, or as an ultimatum to cutting off benefits.

In 1968, 13-year-old Elaine Riddick was raped by a neighbor. After giving birth in a hospital, a social worker deemed her “feeble minded” and officials coerced her illiterate grandmother to sign an “X” on an authorization form to have her sterilized.

“My grandmother was afraid that if she didn’t sign the paper, they would cut off her benefits, like the canned food she got every week,” Riddick said. “So she signed, without understanding what sterilization or tubal ligation really meant.” Riddick, now 57, plans to testify at the session.

Eugenics enjoyed wide support among progressives like Woodrow Wilson and Alexander Graham Bell, and from members of the National Academy of Sciences and the American Medical Association. “It is better for all the world, instead of waiting to execute degenerate offspring for crime or to let them starve for their imbecility, society can prevent those who are manifestly unfit from continuing their kind,” Supreme Court Justice Oliver Wendell Holmes Jr. wrote in the 1927 ruling that upheld the legality of compulsory sterilization. “Three generations of imbeciles are enough.” The 1927 ruling was never overturned. However, in 1942, the Supreme Court ruled against punitive sterilization.

Many states began abandoning their eugenics programs after World War II, fearing comparisons to Nazis’ eugenics practices in Germany. But North Carolina’s program actually grew stronger after the 1940s, bolstered by financial support from some of the state’s wealthiest residents. That is why the state is believed to have more surviving victims, almost 40 percent of the over 7,500 sterilized, even though it is behind Virginia and California as the states with the highest numbers of sterilizations. North Carolina was also unique in that it was the only state that used social workers to urge sterilization, and allowed people to petition the state to have someone sterilized. The program lasted until the late 1970s and the state’s eugenics law was removed from the books in 2003.

After collecting testimonies in Raleigh on June 22, the state task force will make a recommendation to the governor on how to compensate surviving victims. North Carolina congressman Larry Womble is pushing for monetary compensation. $20,000 has been suggested, a figure that could amount to up to $58 million in reparations for the estimated 2,900 surviving victims, although many victims are expected to not come forward out of shame. Reparations of any amount are sure to face stiff opposition, as the state is facing a $2.5 billion budget hole this year.

To learn more about North Carolina’s Eugenics program, visit the Winston-Salem Journal’s special report, “Against Their Will.”

Outcry in America as pregnant women who lose babies face murder charges

Women's rights campaigners see the creeping criminalisation of pregnant women as a new front in the culture wars over abortion

Ed Pilkington in New York
guardian.co.uk, Friday 24 June 2011 18.30 BST
http://www.guardian.co.uk/world/2011/jun/2...-murder-charges

Rennie Gibbs is accused of murder, but the crime she is alleged to have committed does not sound like an ordinary killing. Yet she faces life in prison in Mississippi over the death of her unborn child.

Gibbs became pregnant aged 15, but lost the baby in December 2006 in a stillbirth when she was 36 weeks into the pregnancy. When prosecutors discovered that she had a cocaine habit – though there is no evidence that drug abuse had anything to do with the baby's death – they charged her with the "depraved-heart murder" of her child, which carries a mandatory life sentence.

Gibbs is the first woman in Mississippi to be charged with murder relating to the loss of her unborn baby. But her case is by no means isolated. Across the US more and more prosecutions are being brought that seek to turn pregnant women into criminals.

"Women are being stripped of their constitutional personhood and subjected to truly cruel laws," said Lynn Paltrow of the campaign National Advocates for Pregnant Women (NAPW). "It's turning pregnant women into a different class of person and removing them of their rights."

Bei Bei Shuai, 34, has spent the past three months in a prison cell in Indianapolis charged with murdering her baby. On 23 December she tried to commit suicide by taking rat poison after her boyfriend abandoned her.

Shuai was rushed to hospital and survived, but she was 33 weeks pregnant and her baby, to whom she gave birth a week after the suicide attempt and whom she called Angel, died after four days. In March Shuai was charged with murder and attempted foeticide and she has been in custody since without the offer of bail.

In Alabama at least 40 cases have been brought under the state's "chemical endangerment" law. Introduced in 2006, the statute was designed to protect children whose parents were cooking methamphetamine in the home and thus putting their children at risk from inhaling the fumes.

Amanda Kimbrough is one of the women who have been ensnared as a result of the law being applied in a wholly different way. During her pregnancy her foetus was diagnosed with possible Down's syndrome and doctors suggested she consider a termination, which Kimbrough declined as she is not in favour of abortion.

The baby was delivered by caesarean section prematurely in April 2008 and died 19 minutes after birth.

Six months later Kimbrough was arrested at home and charged with "chemical endangerment" of her unborn child on the grounds that she had taken drugs during the pregnancy – a claim she has denied.

"That shocked me, it really did," Kimbrough said. "I had lost a child, that was enough."

She now awaits an appeal ruling from the higher courts in Alabama, which if she loses will see her begin a 10-year sentence behind bars. "I'm just living one day at a time, looking after my three other kids," she said. "They say I'm a criminal, how do I answer that? I'm a good mother."

Women's rights campaigners see the creeping criminalisation of pregnant women as a new front in the culture wars over abortion, in which conservative prosecutors are chipping away at hard-won freedoms by stretching protection laws to include foetuses, in some cases from the day of conception. In Gibbs' case defence lawyers have argued before Mississippi's highest court that her prosecution makes no sense. Under Mississippi law it is a crime for any person except the mother to try to cause an abortion.

"If it's not a crime for a mother to intentionally end her pregnancy, how can it be a crime for her to do it unintentionally, whether by taking drugs or smoking or whatever it is," Robert McDuff, a civil rights lawyer asked the state supreme court.

McDuff told the Guardian that he hoped the Gibbs prosecution was an isolated

example. "I hope it's not a trend that's going to catch on. To charge a woman with murder because of something she did during pregnancy is really unprecedented and quite extreme."

He pointed out that anti-abortion groups were trying to amend the Mississippi constitution by setting up a state referendum, or ballot initiative, that would widen the definition of a person under the state's bill of rights to include a foetus from the day of conception.

Some 70 organisations across America have come together to file testimonies, known as amicus briefs, in support of Gibbs that protest against her treatment on several levels. One says that to treat "as a murderer a girl who has experienced a stillbirth serves only to increase her suffering".

Another, from a group of psychologists, laments the misunderstanding of addiction that lies behind the indictment. Gibbs did not take cocaine because she had a "depraved heart" or to "harm the foetus but to satisfy an acute psychological and physical need for that particular substance", says the brief.

Perhaps the most persuasive argument put forward in the amicus briefs is that if such prosecutions were designed to protect the unborn child, then they would be utterly counter-productive: "Prosecuting women and girls for continuing [a pregnancy] to term despite a drug addiction encourages them to terminate wanted pregnancies to avoid criminal penalties. The state could not have intended this result when it adopted the homicide statute."

Paltrow sees what is happening to Gibbs as a small taste of what would be unleashed were the constitutional right to an abortion ever overturned. "In Mississippi the use of the murder statute is creating a whole new legal standard that makes women accountable for the outcome of their pregnancies and threatens them with life imprisonment for murder."
Miscarriage of justice

At least 38 of the 50 states across America have introduced foetal homicide laws that were intended to protect pregnant women and their unborn children from violent attacks by third parties – usually abusive male partners – but are increasingly being turned by renegade prosecutors against the women themselves.

South Carolina was one of the first states to introduce such a foetal homicide law. National Advocates for Pregnant Women has found only one case of a South Carolina man who assaulted a pregnant woman having been charged under its terms, and his conviction was eventually overturned. Yet the group estimates there have been up to 300 women arrested for their actions during pregnancy.

In other states laws designed to protect children against the damaging effects of drugs have similarly been twisted to punish childbearers.

TheUnhivedMind - June 23, 2011 03:54 AM (GMT)

Just another brick in the wall: UN Agenda 21 in US law

Anthony Freda - "Liberty Upended"

Marti Oakley, Contributing Writer
Wednesday, June 22, 2011
http://www.activistpost.com/2011/06/just-a...-agenda-21.html

Let me lay this out for you in a simple way, so that maybe you can get the gist of what is really going on and how through incremental legislation EVERYTHING is being taken away from us.

The CLEAR Act: A pre-planned and pre-written bill; one just waiting for that golden opportunity to magically appear, will seize all water rights, coastal and in-land. BINGO! We got the BP oil spill and this is one of the excuses for the CLEAR Act. This bill seizes all mineral, gas and oil rights and permits, and by extension the revenues from those permits. This bill converts state-owned land to federal ownership and control. This Act, which stood little chance of passing, was quietly slipped over to the EPA for implementation through agency regulation and enforcement. This bill also represents the UN position that land ownership and by extension those things derived from the land including water, should be owned only by government.

Although the bill is marketed as another global warming fix for this thoroughly exposed hoax, it redefines “navigable waters” (limiting jurisdiction) to, “waters of America”, an all-encompassing jurisdiction. The bill is at odds with this supreme court ruling which says that investors may build over wetlands. While these two things seem arbitrary on the surface, in fact they are not. This case established a precedent which will allow global interests both foreign and domestic to alter, delete and otherwise redirect natural water

flows for the benefit of business. This got the EPA off the hook. Rapanos v supreme court.

This bill will also make the Coast Guard, now a military branch (formerly civil service) a police power not only on the water, but also on land. As a national police force, they might site you on land or water for an infraction of federal corporate codes, and may now take you to a military tribunal or administrative corporate court: it is entirely at their discretion.

Cap & Trade: This is a bill built on one of the greatest scams in recent history; the global warming myth. This myth was promoted to make C&T seem plausible. In reality, the bill would not have reduced carbon emissions and was never intended to. The only true function of the bill was revenue generation. Big polluters would be given credits to use or to sell, generating a secondary market. Once the climate-gate emails revealed the fraudulent science and the open intention to mislead the public through the use of fraudulent data, global warming was dispensed with and the issue became climate-change (you are supposed to be too stupid to realize it is the same deal). Once exposed as a fraud, the bill was quietly slipped over to the EPA to implement and to enforce, which they are doing.

Under Agenda 21, every aspect of life is controlled by the state.

The Healthcare Reform Act: Another bill that is nothing more than a loss of control over our individual selves that also includes a massive system of fines, fees, penalties, co-payments and of course the ever-popular mandate that we must buy some crappy insurance policy that in essence will cover nothing much. The bill also mandates mandatory vaccines and relegates the decisions on your healthcare to a “panel” in some agency who will decide what treatments might be available to you. Dependent on your age and what your value to the community might be if an investment was made in your recovery, will determine what treatments you get.

Did we regulate the insurance industry so that it cannot charge extortion rates? No!

Did we make sure that a right to negotiate prescription drug prices was included? No!

Were pharmaceutical manufacturers held liable for defective medications and vaccines which cause massive illnesses and death? No!

Was anything at all in this bill conducive to cleaning up the healthcare, pharmaceutical and insurance industries? Absolutely not.

Trade agreements

As the devastation to our economy, manufacturing base, job base, continues unabated largely as a result of numerous illegal trade agreements which devastated every sector of the economy, an estimated 22 million people find themselves ultimately out of work. Without regard to the devastating effects of additional free trade agreements, Obama is now considering signing the South Korean Trade Agreement costing the US an estimated 179,000 jobs. This agreement is NOT a constitutional treaty. It is a private corporate to corporate agreement between the executives of those corporations; ie., Our president and the leader of South Korea.

Did we penalize any corporation that shut its doors here in the US and then went over to some third world country to ply their trade? No! We are forced to subsidize them by allowing them to continue to conduct business in the US without any tariffs for doing so; in fact without having to pay anything for the privilege of conducting business in the US. They are allowed to rake in massive profits, route them through foreign banks and avoid most US taxes.

In the midst of all of the above, came the foreclosures on homes across the country as the trap laid for many unsuspecting homeowners, slammed shut. The trap had been carefully laid using derivatives, fractional selling, multiple selling of mortgage contracts, artificial inflation of the housing market and adjustable rate mortgages that somehow almost simultaneously inflated all at one time and then collapsed. Of course, none of the career criminals from Wall Street or banking who were working in tandem with the District of Criminals ever saw a day in jail for their corruption and not one was forced to forfeit even a portion of their ill-gotten gains.

UN Agenda 21 defers to corporations as the appropriate “persons” regarding import/ export of a nations assets.

Did we bail out homeowners? No! We bailed out the thugs and thieves!

Now here is where we start putting the puzzle pieces together:
S.510 fake food safety bill will destroy independent agriculture and export most of our food product out of the country (our food).
The CLEAR act takes our water, minerals, mining and land (water & raw materials) now slated for implementation by EPA. There goes your right to clean affordable, water.
Cap & Trade sells the rights to pollute for a fee (our air) EPA Again! That would be the air you breathe.
Obamacare takes away our 4th Amendment rights to be secure in our persons and our privacy. There goes your personal freedom.
22 million are jobless (and this number is rising).
47 million families are on food stamps (also rising).
Food prices have risen 70% in less than a year.
Foreclosures are at an historical high (and rising).

Of the bills mentioned, each includes a prohibition on judicial revue: meaning the agencies which will now be aggressively assaulting private citizens cannot be taken into court.
SB 1619 The Livable Communities Act will resurface and be sold as “the future” of America…..the only way they can keep us safe.
The Livable Communities Act, (SB 1619) was introduced by outgoing Senator Christopher Dodd (D-Conn.). It seeks to fulfill the United Nation’s plan Agenda 21, adopted at the Earth Summit in Rio de Janeiro in 1992 and signed onto by “New World Order” President George H.W. Bush. This bill is the rounding up of all the displaced workers, homeless families, rural folk, and who ever else can be herded into these United Nations, planned population centers. This is the creation of ghettos that will virtually function as prisons for massive portions of the population as land is seized and declared off limits to human habitation as required under the UN Agenda 21 plan.

This act:
Is a blueprint for the transformation of our society into total Federal control.
Will enforce Federal Sustainable Development zoning and control of local communities.
Will create a massive new “development” bureaucracy.
Will drive up the cost of energy to heat and cool your home.
Will drive up the cost of gasoline as a way to get you out of your car.
Will force you to spend thousands of dollars on your home in order to comply with EPA demands that you must meet their standards before you can sell your home.
Much of this is already in play and evident in the economy and in government as we are steered into accepting UN control.

And that is where we end up: at the United Nations. Virtually everything mentioned here and much more that was not mentioned can be traced back to UN agenda 21 mandates. We are being maneuvered into economic disaster while losing our freedom and human rights to water and food and self determination.

While we founder on the edge of un-repayable national debt, congress on both sides of the fictional isle and the president work tirelessly to implement by stealth the Agenda 21 protocols. Our government refuses to impose a moratorium on foreign aid even as American’s slide into poverty and this same government refuses to give aid to Americans.

If there is anything the United Nations hates worse than our dogged determination to remain free, it is our insistence that we will not fall under UN control. Of course the politicians in the District of Criminals, whether Republican or Democrat, and our president have other plans for us.

Marti Oakley is a political activist and former op-ed columnist for the St Cloud Times in Minnesota. She was a member of the Times Writer’s Group until she resigned in September of 07. She is neither Democrat nor Republican, since neither party is

representative of the American people. She says what she thinks, means what she says, and is known for being outspoken. She is hopeful that the American public will wake up to what is happening to our beloved country . . . little of it is left. Her website is The PPJ Gazette

Pennsylvania County Rejects Agenda 21

Written by Kelly Holt
24 March 2011 09:33
Thursday June 23, 2011 Home
http://www.citizenreviewonline.org/2011/Ma..._Agenda_21.html

The Mercury, March 8, reported that Montgomery County, Pennsylvania, will be letting its membership in ICLEI (International Council of Local Environmental Initiatives), lapse due to constituent pressure and dislike for ICLEI's message, Agenda 21.
Montgomery County commissioners learned what that meant at a recent meeting held in the county seat, Norristown, when local residents, Maggie Roddin and Ruth Miller charged the county commissioners with "being in league with the U.N. to promote that organization's global warming agenda."
Montgomery, and surrounding counties, including neighboring Philadelphia County, joined in 2007 for, like many other communities, "the purpose of buying software to calculate the county's carbon footprint. ICLEI's mission is to help local governments achieve 'global sustainability,' according to the organization's charter." Edmond, Oklahoma joined for the same reason but the city recently rejected its membership, partly because local residents learned that a city's agreement to that same charter places the city under the jurisdiction of the ICLEI.
At the Norristown meeting, Commissioner Joseph Hoeffel, amused at Roddin's and Miller's allegations, said, "The only thing I laugh at is absurd allegations that the county has a treaty with the United Nations or a treaty with a foreign government."
But across the country, in Edmond, a grassroots effort, Govern Edmond Locally (GEL) came up against the same denials from its city officials. GEL found it quite easy to connect ICLEI membership with the United Nations and has issued its "3 Click Challenge," available on its website, to warn residents of the U.N. connection.

Residents of other cities already embroiled with Agenda 21, or in those communities considering it, find the easy to understand Challenge a useful tool in combating the misinformation circulating about sustainability by making the connection in three mouse clicks.

In spite of Commissioner Hoeffel's claims of no U.N. affiliation, the website of Montgomery County, which received $6.2 million in stimulus funds, reveals that …the Greenprint plan found on the county's website, the Intergovernmental Panel on Climate Change, formed by the U.N. in 1988 to study global climate change, "provides broad evidence that global climate change is a reality, and that human activity appears to be altering the climate by increasing atmospheric levels of greenhouse gases.

Sustainability sounds warm and fuzzy but when residents find that their cities are signing on to a U.N. scheme, they are successfully fighting back. Miller told the commissioners, "I am here today to be the voice of residents of Montgomery County, who I am certain are unaware that their county government has signed a treaty with the United Nations to reach global sustainability goals."

The Mercury noted that the Roddin and Miller have spoken out at past meetings about the UN agenda to slowly erode property rights. Miller continued, "The United Nations is creating a global governance framework right under our noses and you, as County Commissioners are in a position to stop it."

According to local activist Mark Affleck, "Maggie Roddin has a radio show and has been instrumental, if not responsible for, getting the word out about the dangers of ICLEI and Agenda 21. Her work, along with Ruth Miller's, demonstrates what can happen if a few people get involved. There's more to do, but these two have been pretty much alone in battling Agenda 21 in this area."

County Policy Chief Steve Nelson said Wednesday that the membership had expired.

The New American has been leading the way in educating readers about Agenda 21 and sustainability. William F. Jasper authored Your Hometown & the United Nations' Agenda 21 last month, about the dangers posed to local communities. Understanding of this issue is important to defending your city, and prompted Tom DeWeese, American Policy Center to pen an article about effective opposition, How To Fight Back Against Sustainable Development

Al Gore branches out into population control theory

June 22, 2011
http://wattsupwiththat.com/

Not content to make a fool of himself confusing weather and climate, Al has now decided to lecture empower women on how to reduce the population for the benefit of the planet. Watch the video below, now we know why he doesn't allow recordings of his lectures. Darn those Flip Video Cameras.

Al Gore How Empowering Women Fights Climate Change

[dohtml]<object style="height: 390px; width: 640px"><param name="movie" value="http://www.youtube.com/v/NpCt8sEq0kI?version=3"><param name="allowFullScreen" value="true"><param name="allowScriptAccess" value="always"><embed src="http://www.youtube.com/v/NpCt8sEq0kI?version=3" type="application/x-shockwave-flash" allowfullscreen="true" allowScriptAccess="always" width="640" height="390"></object>[/dohtml]

And here is his wisdom of weather and climate

Al Gore Talks Extreme Weather, Climate

[dohtml]<object style="height: 390px; width: 640px"><param name="movie" value="http://www.youtube.com/v/IvH_0etJ1cs?version=3"><param name="allowFullScreen" value="true"><param name="allowScriptAccess" value="always"><embed src="http://www.youtube.com/v/IvH_0etJ1cs?version=3" type="application/x-shockwave-flash" allowfullscreen="true" allowScriptAccess="always" width="640" height="390"></object>[/dohtml]

Recorded June 20th by Brian Merchant, hat tip to Chris Horner.

UPDATE: Tom Nelson on his blog points out the bottled water next to Gore.

Flashback: Pour the bottled-water trend down the drain

it's time for those of us who care about the environment and are concerned about global warming to stop buying and drinking bottled water.

2007: Bottled Water Ban Not Enough
Following the radically liberal traditions of San Francisco, Mayor Gavin Newsom banned municipal departments from purchasing bottled water, even for water coolers.

TheUnhivedMind - June 22, 2011 01:52 AM (GMT)

Agenda 21 Indoctrination Going Global at Warp Speed

Tuesday, June 21, 2011
http://www.activistpost.com/2011/06/agenda...ing-global.html

For those not familiar with Agenda 21 and “sustainable development”, I urge you to take a crash course and visit some of the leading researcher’s on the subject: Michael Shaw at Freedom Advocates, Cassandra Anderson at Morph City, key reports such as "UN Agenda 21 Will Rule the US Waves" from organizations like the Science & Public Policy Institute as well as take a look at the numerous lectures archived by Dr. Stanley Monteith over at Radio Liberty.

Image source

Jorge Mascarillo
Activist Post

It is time to sound the alarm yet again on Agenda 21. Much of the focus of critical LA21 discussion has centered on its progress in the United States, but it too has been making rapid inroads into México, as to the rest of the planet.

Background - Regionalization
As we all know (or should be aware of), México is purported ground zero for the testing and total implementation of iris-scanning biometric identification technology according to Hoyos Group (formerly Global Rainmakers), which is set to eventually encompass the globe (their estimate is ten years).[1] Youth here will soon be obligated to receive national biometric ID cards with a view of moving on to the general population. This is all for our safety. Please try to ignore the fact the US agency, ATF, has been arming drug cartels with heavy weaponry.[2] Please also make an attempt to pretend you never

heard drug cartels have been moving massive amounts of cocaine and heroin into the U.S. with the oversight of the DOJ, FBI, DEA and ICE.[3]

Harper and Obama's recent agreement on the common security perimeter has stated the move to work "toward common technical standards for the collection, transmission, and matching of biometrics that enable the sharing of information on travellers in real time."[4] We know that the 1980 Bilderberg report stated the goal of working toward a "North American common bloc" and that the 1989 US-CAN bilateral trade agreement added México into the mix in 1994 with NAFTA.[5] One can assume that the 2011 US-CAN common security perimeter will eventually add in a bit of Méxican spice to spruce things up. These developments also mirror the 2005 Council on Foreign Relations Task Force objectives.[6]

Agenda 21 Indoctrination

Some private schools south of the border have now begun replacing traditional courses on society and economics with courses on "Environment and Sustainability". The replacement of the economics social studies course with an environmental course is de facto giveaway to the nature of this new doctrine, one seeking to supplant traditional economic and societal structure. Based on pseudo-science, the green global warming movement seeks to serve as an excuse to restructure society as a whole, establish a (global) centrally planned economy and a political structure (the "planetary regime") working through regional government. Remember, the failed 2010 Cancun UN Climate Change Conference stated the possibility of forced relocation of endangered parts of the Méxican population, based on UN dictate to be executed by the national government, as part of the environmental agenda.[7]

It is humorous how they changed the name from global warming to "climate change", because the planet may not be warming after all and nobody can deny that the climate... changes. The climate changes just as the sun rises. "Fighting" climate change would be like fighting the rising of the sun. Maybe we should nuke the sun?

In this new course, the topics include: "ecosystems, environment, society, development and sustainability." If focuses heavily on the importance of the environment and understanding it from a "global perspective", not beginning from a local perspective!

Furthermore, there is a heavy focus on resource availability, demand and population growth. The underlying thread of the eugenics nature of the environmental movement and their utter obsession with human population and the eradication of the cancer known as man is clearly evident here.

Under the final topic of "sustainable development", students examine the concept "economically, socially, environmentally, politically and technologically". If this isn't a

viewpoint of totally restructuring our society, I don't know what is. Finally, students are to "Analyze the characteristics and the application of Agenda 21: México in the international context and the actions at a regional and local level."

How is this program implemented exactly? Take a cue from the Bilderberg syndicate structure. The heads of academia, as with any other field, attend the World Economic Forum and so forth. It's easy: go back to your institution and out of peer pressure or inside knowledge, implement the agenda!

The teachers that then go ahead and put it to use in the classroom, generally, have no idea of the true nature of the material they are teaching and merely superficially study the material themselves before passing it on to the unsuspecting populace.

The green culture has already been created by academia, via the policy making networks and institutes, government which has accepted this doctrine from the think tanks without question, manufactured media consent and ultimately the social pressure this all creates. To question is kooky! To defy is heresy!

It was only a few months back that the high priest of the Gaia religious cult, Al Gore, came to bless this country.[8] He reportedly received anywhere from tens of thousands of dollars to hundreds of thousands of dollars for issuance of the rite. The glitz and glamour of this celebrity bowled over the crowd. In a private after session, a brainwashed university student even asked His Highness, in very serious manner, as to how this would all improve the new world order. In fact, a month later, the international relations conference was titled, wouldn't you believe it, "New World Order"!

Congress of International Relations -- The New World Order: Reconfiguring "Scenarios", "Settings", or "the stage"

A Green World Religion

As documented in a recent series of reports, the sustainability doctrine is infesting all of higher education. "It emphasizes maximal conservation of resources and government regulation to the near exclusion of other approaches."[9] Every single student must be knowledgable and engaged in sustainability.
The analysis there of the movement emphasized its economic and political imperatives. At one level this is largely accurate. The sustainability movement is heir to the disappointments of European socialists and ex-communists. It sprang into existence in 1987 with the report of the UN Commission on Environment and Development, chaired by Norwegian prime Minister Gro Harlem Brundtland. The connection to land-use planning, the commitment to extra-territorial regulation, and the readiness to by-pass democratic procedure are in the DNA of the sustainability movement. A great deal of its mischief, as in the persistently misleading pronouncements from the Intergovernmental

Panel on Climate Change, stems from the grounding of the sustainability movement in attitudes far removed from American political and cultural traditions.
But the traction that the movement has gained in the United States doesn't have much to do with spontaneous admiration for UNESCO bureaucrats or international elites who jet around the world promoting massive transfers of wealth to impoverished nations. Those ideas eventually find welcome in the minds of students who have worked their way deep inside the concept that they are now 'citizens of the world.' The movement's mass appeal lies elsewhere.
Sustainability is first of all an emotional summons—one that combines elemental fears with hopes of salvation. It draws heavily on Judeo-Christian imagery and a secularized, but not very deeply disguised, Christian narrative of a good creation corrupted by human sin and headed for disaster, which might be staved off through sufficient acts of penitence—like giving up the internal combustion engine, not to mention bottled water and cafeteria trays.
The religious narrative is interwoven with other strands of Western mythology. It isn't hard to find Rousseau's imaginary picture of man uncorrected by civilization filtering into the dreams of sustainatopians. The movement expresses a longing for lost innocence, for the "re-enchantment" of nature as one of its proponents puts it, and for an easily captured high ground on which alienation from mass consumerism can be played out as though it had positive content. Somehow we can feel better about ourselves if we believe the world is going to wrack and ruin because of the heedlessness and greed of others.
And it thrives because it is a substitute religion that demands a manageable degree of expiation, self-sacrifice, and guilt.[10]

Not that any of this is anything new. The ancient agenda has always been, and will always be, the vie for total global domination. The only thing that changes is the excuse used to put fear into the population, in that they would go along.

The Darwinist eugenicist and brother of "Brave New World" Aldous, Julian Huxley, in a parting 1948 speech, told us we must look at our problems "as part of a single world problem, where the several nations must learn to make adjustments in the interest of the whole body of nations." That he "thinks of such problems as over-population." Furthermore, he stressed the need to develop "citizens of the One World of the human mind" as he welcomed the inauguration of a prominent Mexican politician as the next Director General of UNESCO, Jaime Torres Bodet.[11]

One key dilemma I come to over and over again is: if nation states have failed and are run by corrupt agents (as almost all are), what in the world makes them think that a single world state will function any better? It defies logic!

If you can hear this, you are the resistance. Please send out your stories, write of your experiences, put them in the comment sections.

P.S. Is this still crazy talk for you? Well, don't take it from me, here is Joe Deiss, a cog in the UN machine discussing the need for "global governance" and Agenda 21 (as part of the nation state takeover, timeline 2050) in dull, read-between-the-lines bureaucrat-o-speak. I am forced merely to link to the website as embedding YouTube material may soon mean you are a terrorist.

Sterilisation GM foods

We have a hothouse filled with corn plants that make anti-sperm antibodies

by David Wetzel http://www.greenpasture.org/utility/showar.../?objectID=7376
June 2, 2011
http://whale.to/b/we.html

Found this post. thought it flows with several other blog postings i published written by Dr. Don Huber. If below peaks your curiosity and you want to start your investigation please take a look on my blog for the articles written by Dr. Don Huber on GMO's.

According to F.W. Engdahl, an American-German freelance journalist, historian, and economic researcher, one long-standing project of the U.S. government has been to perfect a genetically-modified strand of corn. This variety of corn was field-tested over ten years ago, and according to the president of the small bio-tech firm in charge of that project...

"We have a hothouse filled with corn plants that make anti-sperm antibodies."

Taking antibodies from women with a rare condition known as "immune infertility" and isolating the genes that regulated the manufacture of those antibodies, they inserted them into the corn plants, creating, in essence, a biological weapon for population control.

And who was helping to finance this endeavor? The Gates' Foundation (which includes the Buffet Foundation) and the Rockefeller Foundation, through a project called The Alliance for a Green Revolution, headed by none other than former U.N. Chief, Kofi

Annan. Major GMO agri-businesses are reported to be at the heart of AGRA, using it to spread their GMO technology throughout the Third World. According to Engdahl, "Gates and Buffet are major funders of global population reduction programs." Included in this unholy alliance is Ted Turner, who thinks that a 95% reduction in global population to around 300 million would be "ideal."

And remember, the Rockefeller Foundation has been involved in eugenics and genocide since it began funding the eugenics research in Germany in the 1920s and well into the Third Reich. (Seeds of Destruction, F.W. Engdahl.) The Rockefellers backed the forced sterilizations and racial purity ideology of Hitler's Germany.

But how does a Third World program affect us in western civilization? More specifically, how does it affect us here, in the United States?

Shortly after the introduction of GMO corn into the U.S. in 1996, birth rates began falling. Since 1999, birth rates have plummeted even faster - just three years after GMO corn was introduced into the food supply.

GMOS, according to scientists interviewed for the film Science Under Attack, have been known to cause smaller brain size, lowered immunity, organ damage, and infertility in animals fed biotech food. Does this correspond to the 20% rate of infertility occurring in our population today? That's a good question. Unfortunately, agri-giants and our government are suppressing the answers.

Since 2008, the U.S. government has opposed a national effort to label GMO foods. They upped the ante by trying to suppress GMO labeling anywhere in the world, by using Codex, the U.N. arm that seeks to regulate every food, mineral, and herb in the world used for consumption. However, this effort has stalled because Codex doesn't look at GMO created products as "food."

However, Codex does place these products into a special category that can be utilized in alternative applications. (Like birth control, maybe?)

Genetically engineered corn, soy, cottonseed oil, and canola oil are the most processed foods in the United States. These foods have NEVER been tested for safety in human consumption ... even though animal studies show severe organ damage, spontaneousabortions, and sterility when consumed.

Take control of your fertility ... your health ... your life ... by taking control of your own food supply.

Monsanto: This is the company that the FDA lets do its own Environmental Impact Statements and is allowed to submit GMOs as GRAS, or generally recognized as safe, without investigation. The company that is killing people on an unprecedented scale due to falsified studies on Agent Orange HAS A MONOPOLY ON OUR FOOD SUPPLY. Do you still think our government is not engaged in population reduction warfare against its own citizens?

Alexandra - June 21, 2011 10:18 PM (GMT)

My uncle, Norman Holland, fought in Vietnam. He died of colon cancer on November 15, 1985, a month shy of his 40th birthday. I've heard it said that he got sprayed with Agent Orange.

TheUnhivedMind - June 18, 2011 03:44 AM (GMT)

Agenda 21 In One Easy Lesson

June 17, 2011
http://americanpolicy.org/sustainable-deve...sy-lesson.html/

Awareness of Agenda 21 and Sustainable Development is racing across the nation as citizens in community after community are learning what their city planners are actually up to. As awareness grows, I am receiving more and more calls for tools to help activists fight back. Many complain that elected officials just won't read detailed reports or watch long videos. "Can you give us something that is quick, and easy to read that we can hand out," I'm asked.

So here it is. A one page, quick description of Agenda 21 that fits on one page. I've also included for the back side of your hand out a list of quotes for the perpetrators of Agenda 21 that should back up my brief descriptions.

A word of caution, use this as a starter kit, but do not allow it to be your only knowledge of this very complex subject. To kill it you have to know the facts. Research, know your details; discover the NGO players in your community; identify who is victimized by the policies and recruit them to your fight; and then kill Agenda 21. That's how it must be done. The information below is only your first step. Happy hunting.

What is Sustainable Development?

According to its authors, the objective of sustainable development is to integrate economic, social and environmental policies in order to achieve reduced consumption, social equity, and the preservation and restoration of biodiversity. Sustainablists insist that every societal decision be based on environmental impact, focusing on three components; global land use, global education, and global population control and

reduction.

Social Equity (Social injustice)

Social justice is described as the right and opportunity of all people “to benefit equally from the resources afforded us by society and the environment.” Redistribution of wealth. Private property is a social injustice since not everyone can build wealth from it. National sovereignty is a social injustice. Universal health care is a social injustice. All part of Agenda 21 policy.

Economic Prosperity

Public Private Partnerships (PPP). Special dealings between government and certain, chosen corporations which get tax breaks, grants and the government’s power of Eminent Domain to implement sustainable policy.

Government-sanctioned monopolies.

Local Sustainable Development policies

Smart Growth, Wildlands Project, Resilient Cities, Regional Visioning Projects, STAR Sustainable Communities, Green jobs, Green Building Codes, “Going Green,” Alternative Energy, Local Visioning, facilitators, regional planning, historic preservation, conservation easements, development rights, sustainable farming, comprehensive planning, growth management, consensus.

Who is behind it?

ICLEI – Local Governments for Sustainability (formally, International Council for Local Environmental Initiatives).\

Communities pay ICLEI dues to provide “local” community plans, software, training, etc. Addition groups include American Planning Council, The Renaissance Planning Group, International City/ County Management Group, aided by US Mayors Conference, National Governors Association, National League of Cities, National Association of County Administrators and many more private organizations and official government agencies. Foundation and government grants drive the process.

Where did it originate?

The term Sustainable Development was first introduced to the world in the pages a 1987 report (Our Common Future) produced by the United Nations World Commission on Environmental and Development, authored by Gro Harlem Brundtland, VP of the World Socialist Party. The term was first offered as official UN policy in 1992, in a document called UN Sustainable Development Agenda 21, issued at the UN’s Earth

Summit, today referred to simply as Agenda 21.

What gives Agenda 21 Ruling Authority?

More than 178 nations adopted Agenda 21 as official policy during a signing ceremony at the Earth Summit. US president George H.W. Bush signed the document for the US. In signing, each nation pledge to adopt the goals of Agenda 21. In 1995, President Bill Clinton, in compliance with Agenda 21, signed Executive Order #12858 to create the President's Council on Sustainable Development in order to "harmonize" US environmental policy with UN directives as outlined in Agenda 21. The EO directed all agencies of the Federal Government to work with state and local community governments in a joint effort "reinvent" government using the guidelines outlined in Agenda 21. As a result, with the assistance of groups like ICLEI, Sustainable Development is now emerging as government policy in every town, county and state in the nation.

Revealing Quotes From the Planners

"Agenda 21 proposes an array of actions which are intended to be implemented by EVERY person on Earth…it calls for specific changes in the activities of ALL people… Effective execution of Agenda 21 will REQUIRE a profound reorientation of ALL humans, unlike anything the world has ever experienced… " Agenda 21: The Earth Summit Strategy to Save Our Planet (Earthpress, 1993). Emphases – DR

Urgent to implement – but we don't know what it is!

"The realities of life on our planet dictate that continued economic development as we know it cannot be sustained…Sustainable development, therefore is a program of action for local and global economic reform – a program that has yet to be fully defined." The Local Agenda 21 Planning Guide, published by ICLEI, 1996.

"No one fully understands how or even, if, sustainable development can be achieved; however, there is growing consensus that it must be accomplished at the local level if it is ever to be achieved on a global basis." The Local Agenda 21 Planning Guide, published by ICLEI, 1996.

Agenda 21 and Private Property

"Land…cannot be treated as an ordinary asset, controlled by individuals and subject to the pressures and inefficiencies of the market. Private land ownership is also a principal instrument of accumulation and concentration of wealth, therefore contributes to social injustice." From the report from the 1976 UN's Habitat I Conference.

"Private land use decisions are often driven by strong economic incentives that result in several ecological and aesthetic consequences…The key to overcoming it is through

public policy…" Report from the President's Council on Sustainable Development, page 112.

"Current lifestyles and consumption patterns of the affluent middle class – involving high meat intake, use of fossil fuels, appliances, home and work air conditioning, and suburban housing are not sustainable." Maurice Strong, Secretary General of the UN's Earth Summit, 1992.

Reinvention of Government

"We need a new collaborative decision process that leads to better decisions, more rapid change, and more sensible use of human, natural and financial resources in achieving our goals." Report from the President's Council on Sustainable Development

"Individual rights will have to take a back seat to the collective." Harvey Ruvin, Vice Chairman, ICLEI. The Wildlands Project

"We must make this place an insecure and inhospitable place for Capitalists and their projects – we must reclaim the roads and plowed lands, halt dam construction, tear down existing dams, free shackled rivers and return to wilderness millions of tens of millions of acres or presently settled land." Dave Foreman, Earth First.

What is not sustainable?

Ski runs, grazing of livestock, plowing of soil, building fences, industry, single family homes, paves and tarred roads, logging activities, dams and reservoirs, power line construction, and economic systems that fail to set proper value on the environment." UN's Biodiversity Assessment Report.

Hide Agenda 21's UN roots from the people

"Participating in a UN advocated planning process would very likely bring out many of the conspiracy- fixated groups and individuals in our society… This segment of our society who fear 'one-world government' and a UN invasion of the United States through which our individual freedom would be stripped away would actively work to defeat any elected official who joined 'the conspiracy' by undertaking LA21. So we call our process something else, such as comprehensive planning, growth management or smart growth." J. Gary Lawrence, advisor to President Clinton's Council on Sustainable Development.

TheUnhivedMind - June 18, 2011 12:37 AM (GMT)

Sex selection and the rise of Generation XY

A new book explores western involvement in what has become a scourge of the developing world: sex selection of babies

Ed Pilkington in New York
guardian.co.uk, Friday 17 June 2011 18.45 BST
http://www.guardian.co.uk/world/2011/jun/1...e-generation-xy

In 1979 China signed a $50m four-year deal with a UN body designed to help it control its spiralling population through family planning. It was the largest foreign aid package Beijing had accepted in almost 20 years.

But the funds became entwined in China's one-child policy that was just taking hold, and instead of sponsoring an education drive for small families, the money was used to pay for posters in Chinese villages proclaiming "You can abort it! But you cannot give birth to it."

The story of the complicity of the UNFPA, the UN's main population agency, in the tyranny of China's forced abortion policy is just one of the examples given in a book that explores western involvement in what has become a modern scourge: sex selection.

Unnatural Selection by Mara Hvistendahl charts how the trend towards choosing boys over girls, largely through sex-selective abortions, is rapidly spreading across the developing world.

While the natural sex ratio at birth is 105 boys born for every 100 girls, in India the figure has risen to 112 boys and in China 121. The Chinese city of Lianyungang recorded an astonishing 163 boys per 100 girls in 2007.

The bias towards boys has been estimated to have caused the "disappearance" of 160 million women and girls in Asia alone over the past few decades. The pattern has now spilled over to Azerbaijan, Georgia and Armenia, the Balkans and Albania, where the sex ratio is 115/100.

The unnatural skewing towards male populations has become so pronounced in recent decades that Hvistendahl, a writer for Science magazine, says it has given rise to a new "Generation XY". She raises the possibility that with so many surplus men – up to a fifth of men will be single in northwestern India by 2020 – large parts of the world could become like America's wild west, with excess testosterone leading to raised levels of crime and violence.

"Historically, societies in which men substantially outnumber women are not nice places to live," Hvistendahl writes. Already, the relative shortage of women in countries like China and Taiwan has helped create new markets in women.

They include arranged wedding agencies that set up marriages between South Korean men and foreigners, often women from poorer nearby countries like Vietnam, that now account for 11% of all marriages in South Korea.

There is also a booming trade in trafficking of women for prostitution out of Vietnam and a growing practice of child marriage in China, where wealthier families secure wives for their sons early by effectively buying young girls for their sons.

Much of the literature on sex selection has suggested that cultural patterns explain the phenomenon. But Hvisten dahl lays the blame squarely on western governments and businesses that have exported technology and pro-abortion practices without considering the consequences. Amniocentesis and ultrasound scans have had largely positive applications in the west, where they have been used to detect foetal abnormalities. But exported to Asia and eastern Europe they have been intricately linked to an explosion of sex selection and a mushrooming of female abortions.

Hvistendahl claims western governments actively promoted abortion and sex selection in the developing world, encouraging the liberalisation of abortion laws and subsidising sales of ultrasounds as a form of population control.

"It took millions of dollars in funding from US organisations for sex determination and abortion to catch on in the developing world," she writes.

Even now, when the pattern of sex selection has been well documented and the prospect exists of the developing world accommodating tens of millions more men than women, the UNFPA is refusing to face up to its mistakes and confront the problem, she says.

"The effects of the major UN agency tasked with population advocacy distancing itself from the issue of sex selective abortion are immense," she writes, noting that the agency's foot-dragging has discouraged other global funds from engaging with the crisis.

RFID tracking system for US immigration detention centres

Alanco (published 24/11/2008)
http://www.prosecurityzone.com/Customisati...ion_centres.asp

TSI PRISM to be installed in 19 detention centres in America for RFID tracking of inmates using wrist transmitters

Alanco Technologies has announced that its TSI PRISM subsidiary has been selected as a subcontractor by Northrop Grumman to provide RFID inmate tracking systems for nineteen federal immigration detention facilities. The Department of Homeland Security awarded Northrop a task order to provide infrastructure and an integrated system that will locate and track detainees, reserve bed space among various facilities, and manage detainee transportation. The task order consists of a one year, $14 million base period with three of one year options for a total potential value of $44.35 million. Due to contractual requirements, the value of the TSI PRISM award cannot be disclosed at this time. The facilities, housing in excess of 20,000 alien detainees, are operated by the US Immigration and Customs Enforcement-Detention and Removal Operations (ICE-DRO), an agency of the Department of Homeland Security (DHS). As the agency experiences an increase in apprehension rates of illegal aliens, ICE-DRO is increasing detention capacity, incorporating RFID detainee tracking and implementing a systems modernization effort to improve transportation asset usage and bed space management.

The Alanco/TSI PRISM subcontract requires the Company to provide RF designs, system hardware including 22,000 TSI PRISM wrist transmitters, staff training and system integration services for the nineteen DRO facilities. The final scope and potential expansion of the RFID systems to be deployed will be determined in consultation with Northrop Grumman and DRO in the commencement phase of the project scheduled for January 5, 2009.

Greg Oester, President of Alanco/TSI PRISM, commented, “The 22,000 detainee, 19 facility size of this project will represent the largest deployment of RFID inmate tracking technology anywhere and is TSI’s first opportunity to work in the federal system, which through its several agencies houses more inmates than any other corrections department in the U.S. The national scale of this project will provide high profile exposure of the benefits of RFID tracking technology to the entire corrections industry, particularly due to the ICE-DRO focus on operational efficiency and cost control. We are gratified to be associated with Northrop Grumman in this major ICE-DRO contract win.”

craig-oxley - September 18, 2009 03:13 PM (GMT)

Boston: People Injected With H1N1 Vaccine Will be Issued Bracelet with Tracking Codes

Published on 09-16-2009 Email To Friend Print Version
http://www.boston.com/news/local/massachus..._shot_tracking/

Using technology originally developed for mass disasters, Boston disease trackers are embarking on a novel experiment - one of the first in the country - aimed at eventually creating a citywide registry of everyone who has had a flu vaccination.

The resulting vaccination map would allow swift intervention in neighborhoods left vulnerable to the fast-moving respiratory illness.

The trial starts this afternoon, when several hundred people are expected to queue up for immunizations at the headquarters of the Boston Public Health Commission. Each of them will get a bracelet printed with a unique identifier code. Information about the vaccine's recipients, and the shot, will be entered into handheld devices similar to those used by delivery truck drivers.

Infectious disease specialists in Boston and elsewhere predicted that the registry approach could prove even more useful if something more sinister strikes: a bioterrorism attack or the long-feared arrival of a global flu epidemic. In such crises, the registry could be used to track who received a special vaccine or antidote to a deadly germ.

"Anything you can do to better pinpoint who's vaccinated and who's not, that's absolutely vital," said Michael Osterholm, director of the Center for Infectious Disease Research & Policy at the University of Minnesota. "I wish more cities were doing this kind of thing."

Boston is believed to be the first city to embrace this particular approach to tracking vaccinations against the seasonal flu, estimated to kill 36,000 people each year in the United States, principally the elderly.

But when Boston bought the monitoring system from a Milwaukee company in 2006, emergency authorities had a far different use in mind: tracking people injured in big fires, plane crashes, or other disasters.

"When there's a large catastrophic event, people end up in a variety of healthcare facilities," said Dr. Anita Barry, Boston's director of communicable disease control. "Of course, their family members and loved ones are trying to find out where they are and how they're doing."

To see how well the system would work, emergency crews tested it at the Boston Marathon and the Fourth of July extravaganza on the Esplanade. The trial proved successful.

"If we can make it work in the Boston Marathon medical tent, then you have to think about making it so that it can work in other environments as well - whether it's a community clinic or a doctor's office or a flu shot clinic," said Rich Serino, chief of Boston Emergency Medical Services. Thus, the idea to use the registry as a flu vaccine tracker was born.

Every autumn in medical offices across the country, flu vaccine floods in. The perishable medical product must be delivered to millions in a matter of months.

Keeping track of that cache of vaccine - and which patients are getting it - is a daunting proposition.

In some medical offices, the information is entered into electronic medical records. At Boston's health department, nurses fill out paper forms.

But there's never been any way to systematically monitor whether, for example, Dorchester has lower vaccination rates than the North End.

"When you're working in one clinic, you don't have a good sense of that," said Dr. Alfred DeMaria, top disease doctor at the Massachusetts Department of Public Health. "But if you're tracking multiple clinics in real time, you can see where the uptake is better and where it's less, and then focus on outreach."

Today's experiment, which does not require any additional direct spending, is a first step toward that.

When people arrive for their shots, they will get an ID bracelet with a barcode. Next, basic information - name, age, gender, address - will be entered into the patient tracking database. There will be electronic records, too, of who gave the vaccine and whether it was injected into the right arm or the left, and time-stamped for that day.

The resulting trove of data could be used to figure out why some patients had to wait longer than others to be vaccinated. "When all is said and done," said Jun Davantes, director of product management at EMSystems, the company that makes the technology, "Boston will be able to identify where there are certain bottlenecks in the process and hopefully improve it the next time around."

Ultimately, city health authorities said, they envision creating a network across the city that would allow public and private providers of flu shots to add data to a registry.

But acknowledging patients' privacy concerns, officials promised that if a citywide system were implemented, only a limited amount of information would be gathered - all sitting behind an encrypted firewall.

"I have had people say, 'Oh, that's so big brother,' " said Laura Williams, EMS deputy chief of staff. "But in truth, the unique identifier is unique to the incident. It's not like you will go to the hospital, and they'll say, 'You're the one who got the flu vaccine at 10 o'clock yesterday at the Boston Public Health Commission.' "

U.S. GRAVEDIGGERS TO BE FULLY EMPLOYED: SURPRISED?

By Greg Evensen
September 19, 2009
http://www.newswithviews.com/Evensen/greg144.htm

As most of you are already aware, I broke a story seven months ago in which I described a discussion I had with a friend in the health care profession at a major mid-western hospital. This person told me about the delivery of stainless steel wrist band type bracelets that carried the hardware for uploading, tracking and broadcasting uniquely personal encoded information. These bands were to be used in the event of massive inoculations or other disaster events in which large numbers of people would be

vaccinated and then tracked. I also stated that plans for roadblock enforcement of these issued bands was a component of emergency planning already on the federal and state police shelves, for use when those state or federal agencies called for blockades on the movement of people. I further mentioned that the “bracelets” would be encoded on the spot with tools similar to those used by UPS when packages are delivered and scanned by the driver.

I would not release my source for fear of severe retaliation being waged against this individual for obvious reasons. On September 15th, we were contacted by a friend who said check out the Boston Globe article that has validated every shred of information that I gave earlier this year. The company that is at the forefront of supplying the City of Boston’s Health Services Department with this very device is EMSystems of Milwaukee, Wi.

Each one of you are the final arbitrators for the ultimate destiny you will inherit, here and in the next life. Use this information wisely and prepare for what is inevitable given the direction our nation has been forced into taking.

I am extremely grateful to my precious wife Liz, who dug in and processed the information that revealed this Boston event and EMSystems.

People control efforts through banking, taxes, firearms possession, food, pharmaceuticals, health care, licensing at every phase of life and business, education, military service, and multi level policing agencies, are all so programmed and fatal to individual liberties, that no one alive can deny their reality and the scope of their reach.

Having been raised during the summer months on a farm in central Illinois, I rode an open combine with my grandfather while he harvested tons of seed raised from non-hybrid strains that enriched our cattle and went to market. Today, we are DYING quicker, with the results of hybrid seeds that if they were human would make Frankenstein look tame. It is a giant gene war with crop seeds that has no bearing on whether or not it is nutritious, but whether it is profitable. (Cue the gravediggers)

The same is true with the pharmaceutical companies that labor very moment to shoot drugs or pills into our systems to maintain and “manage” disease rather than cure them, because one shot that cures and costs $1000, is nothing compared to tens of thousands over a lifetime by sentencing many to a needle and ultimately death because of a doctor’s maintaining diabetes or other debilitating ailments. (Cue the gravediggers, again)

The militarization or weaponized version of the Spanish flu that was extracted from an Alaskan native’s bones who perished during the 1918 pandemic, may be at the center of the next pandemic—or its “cure” depending upon your point of view. Personally, I simply do not trust anything the government tells me concerning any issue you care to bring up. I base that on their string of lies and deceit dating back 175 years. Almost from the very inception of our “Republic” it has been about power and money. Nothing more, nothing less. Those who rose to power were allowed to do so, by anointed elites both in our nation and Europe. Nothing has changed.

We are simply seeing the final act played out as most of us bury our heads and promote this insidious and lethal combination of communistic worshipping simpletons, and a government all too willing to use these idiots. They are too far gone on the government gravy train to know or to ask any questions at all. Those of us (and thank GOD for patriots) who act as human shields for the keyboard warriors who whine and complain but add nothing to the effort to defeat this express train to hell are weary from years of battle. When the camps begin filling and the roads are mostly empty, the truth of what we have all been saying will cut to the marrow like a razor. (Cue the gravedigger, yet again)

Advertisement

I have advised tens of thousands to have a plan and prepare. If you have done that, you are light years ahead of the ACORN crowd who are betting their miserable and corrupted lives on ACORN'S former legal representative Barack Obama. They and the computerized voting machines that handed this illegitimately elected usurper a national election are enemies of the Republic. They are the ones who need to be in the internment camps by the millions.

If you do not have a plan and are not prepared, then you are already a casualty. Hear that mournful music—it's the gravedigger and he's moving your way.

I have also advised people to think defensively and strategically. I continue to do that, but the time is coming when that will shift to other strategies that Jefferson admonished us about using when dealing with tyranny. That day is just ahead dear friends. I believe there is no way now to avoid it. It almost MUST come, for the evil that surrounds us cannot be destroyed any other way. In a perfect world we could talk it out. We could reason and reach a moral and logical agreement.

Logic, morality, truth, common sense and accountability all went down with the Republic. Vicious evil and its legions must be eliminated. The time for debate is over. The legacy to our children and grandchildren will be utter defeat and evil upon this world unseen since the days of Noah, or a bitter struggle that will stamp out this cancer on our nation, and stand at the doorstep of a new Republic. (The gravedigger is waiting for our response).

Although our "Castle Defense" DVD covers much of the opening information you need to know, it is geared for the novice and those without any plan or idea how to create one. Our second and final DVD, "Castle Doctrine II" is a compilation of a two day in-field "on your bellies in the bush" planning session held at our wooded home in Michigan. It will be ready soon and can be purchased alone or as part of a set with the original Castle Doctrine exclusively at our website, www.theheartlandusa.com. If you cannot get to a national seminar somewhere, then this is available to help you. DVD's of the August 6-8 gathering in Summersville, W.V. where I emceed a stellar gathering of patriot speakers are available at our site as well. You MUST have this historic event in your video library.

If I had a very short list of the most essential items to offer you, then this common sense effort might help. It is basic, but a point to start from.

1. Do not be immunized. Resist if you have to.
2. Begin buying "original" (real) foods from reputable growers.
3. Use meat products from the same sources.
4. Familiarize yourself with "home remedies" and stock those items
5. Buy only the gold and silver necessary to barter your mortgage, etc.
6. Stock food, food, food and ammunition. They will be invaluable.
7. Create home church and Bible studies along with prayer groups.
8. Start moving off the grid and plan how you will live without power.
9. Stockpile quantities of gas, kerosene, diesel, water and candles.
10. Create your plan of defense and protection for your home and area.
11. Sharp-shoot practice with your weapons and prepare to use them.
12. Re-locate to a more rural area near resources and a clean water source.

I intend to do everything in my power to see that our family's cemetery plot remains unfilled for many years. The gravedigger is not welcome here.

Dedicate every available moment from now until this great struggle is over toward planning for your survival and your availability to help remedy this nation's horrible situation. Together, I believe we can do this. Easy? No. Necessary? What is the alternative? When there is nothing left to lose, then you will have your answer. I have mine. I just told the gravedigger to go to hell, and take a bunch of these Obama lunatics with him.

The RFID Conspiracy – Can All Americans Really Be 'Tagged'?

October 9th, 2009
Matthew J. Hunt
http://www.pandemicfluonline.com/?p=1325#more-1325

Because I am a part of the "anti-vaccine movement", I am sensitive to the constant flow of headlines surrounding this whole media-hyped H1N1/Swine Flu pandemic scare. Lately, though, a few headlines grabbed my attention in a different way. These alternative media stories were about alleged "RFID tracking devices" which are supposedly going to be used to "tag" people who have been given the H1N1 vaccine. Accordingly, if one does not have such a tag (in a "wristband" format), he or she would be "caught" at a government run roadblock or checkpoint and be forced to succumb to the vaccine… or very bad things would happen to them.

I will to attempt to put all of this RFID tracking information – as it is being fed to us online – into some kind of perspective – a perspective that doesn't refute nor deny that it could be real, but does look at the feasibility of the "what if" scenarios. It should be an interesting ride. So, buckle-up, don your tinfoil hat and let's begin!

In the last couple of weeks, a video of a woman claiming to be involved in "drills" (one presumes military or police "drills"), has made rounds on the internet and via email. Anti-vaccine websites and activist websites (yes, even this one) linked to the video and helped it to reach a minor "viral" level. To put it plainly, this video is pretty difficult to swallow. It's not that I believe the woman is a liar or she is involved in some anti-anti-vaccine conspiracy or anything like that. If we are to take the information actually conveyed in the video with little or no supporting evidence, it quickly becomes hard to believe for the average Joe. There just isn't enough data in the video to be able to form an opinion of the truthfulness of the message.

Since then, YouTube.com informs us that the video has been removed by the user. Luckily, YouTube users aren't shy about copying, redistributing, or reposting videos created by someone else. Not only that, the person in the video told everyone to feel free to do so. Fortunately, I have a link to a copy of the video in its entirety here:

[dohtml]<object width="425" height="344"><param name="movie" value="http://www.youtube.com/v/3IXoJPuvL9A&rel=0&color1=0xb1b1b1&color2=0xcfcfcf&hl=en&feature=player_embedded&fs=1"></param><param name="allowFullScreen" value="true"></param><param name="allowScriptAccess" value="always"></param><embed src="http://www.youtube.com/

v/3IXoJPuvL9A&rel=0&color1=0xb1b1b1&color2=0xcfcfcf&hl=en&feature=player_embedded&fs=1" type="application/x-shockwave-flash" allowfullscreen="true" allowScriptAccess="always" width="425" height="344"></embed></object>[/dohtml]

If you took the time to watch the video, you'll understand why I'm tackling this RFID topic. One of the big claims the person in the video makes is in regard to the "shackles" or wristbands that people will be forced to wear. She states, "… uh, it's actually a bracelet that you have to put on your right hand and it's somehow pinned into your hand and it's meant to stay there… forever… and it tells them that you've taken the swine flu vaccine… and if you don't have a bracelet, you'll be given the opportunity at the checkpoint to take the swine flu vaccine and if you don't take it, you'll be boarded onto a bus to a concentration camp."

[dohtml]<object width="425" height="344"><param name="movie" value="http://www.youtube.com/v/48tb1EXQU54&rel=0&color1=0xb1b1b1&color2=0xcfcfcf&hl=en&feature=player_embedded&fs=1"></param><param name="allowFullScreen" value="true"></param><param name="allowScriptAccess" value="always"></param><embed src="http://www.youtube.com/v/48tb1EXQU54&rel=0&color1=0xb1b1b1&color2=0xcfcfcf&hl=en&feature=player_embedded&fs=1" type="application/x-shockwave-flash" allowfullscreen="true" allowScriptAccess="always" width="425" height="344"></embed></object>[/dohtml]

That's a serious claim. We've heard this before from other sources. (Again, I am not disputing if these claims are true or not. I'm just trying to pull together information to discern a true picture of what is going on.) It doesn't take much for this idea to conjure horrific images from our past… images of other identifiers meant to "stay there… forever".

user posted image

Back in July, former Kansas State Trooper Greg Evensen made very similar claims while speaking to a group. That video is also available on YouTube.com. Evensen, in his answer to a question from the audience, said, "… Now having said that, there are also plans that will ensure that you do not freely travel nor will you be able to really go anywhere without proof that you've had the vaccination at the point that the government mandates that certain levels of the population take the inoculation. When that happens, I have been told by State Troopers across the country that there are plans ready to be implemented that would include roadblocks and 'choke points', as we call them – major interstate junctions – around major cities and so forth where the greatest number of people can be held until they are either – they either prove their vaccination by papers or in the case of a medical specialist in Milwaukee, Wisconsin, told me that they had observed a semi tractor-trailer being unloaded at the hospital loading dock – pallets and pallets, scores of cases of metal bracelets that once put on, would slip into a place and, and be either uh, pegged in there with some kind of, uh, device to hold it in place… but the band was meant to be permanent. On top is a chip. That chip will include all kinds of information about you – the fact that you had been inoculated. Now this is one of several plans. It has not yet seen the light of day… but it is there. It is in readiness."

[dohtml]<object width="425" height="344"><param name="movie" value="http://www.youtube.com/v/qjlZLBBbuqE&rel=0&color1=0xb1b1b1&color2=0xcfcfcf&hl=en&feature=player_embedded&fs=1"></param><param name="allowFullScreen" value="true"></param><param name="allowScriptAccess" value="always"></param><embed src="http://www.youtube.com/v/qjlZLBBbuqE&rel=0&color1=0xb1b1b1&color2=0xcfcfcf&hl=en&feature=player_embedded&fs=1" type="application/x-shockwave-flash" allowfullscreen="true" allowScriptAccess="always" width="425" height="344"></embed></object>[/dohtml]

This second video clip provides us with a better description of the alleged wristbands. However, if you were paying close attention to the first clip, you know that she mentions another video that talked about “shackles”. Perhaps her inspiration was indeed the second clip. I’m just speculating here, but considering the similarities of her claim, it makes sense that she may have borrowed the story from Evensen. One could also be led to think that perhaps the former was so inspired by the latter that she might have extrapolated a bit too much. (Again, by playing “devil’s advocate”, I could say she totally fabricated the rest of her version… no matter how well-intended.) Nonetheless, the device they both discuss certainly sounds like an RFID bracelet. RFID-enabled bracelets are the prevailing solution for just that kind of asset-tracking. In fact, this technology has been implemented in minimum-security prisons to track inmates.

user posted image

Before we dig more deeply into just what these people are trying to warn us about, we need to investigate RFID technology in general. We need to understand what it is, how it is used, and what the limitations are. We need a primer on RFID itself.

What is RFID?

Being a techie by trade, I tend to like digging very deeply into as many facets of a story as possible. I don’t think it is really possible to have a “sane” opinion regarding the alleged RFID bracelets without knowing what the technology really does. Doing so helps one to sort out the fantasy from the fiction. It also helps one to better form his or her answers to the inevitable questions that arise. Can this really be used on the entire population?

According to Wikipedia.org, RFID means “radio-frequency identification” and it refers to the use of an object applied to or incorporated into a product, animal, or person for the purpose of identification and tracking using radio waves. The “object” they are talking about is typically called an “RFID tag” and it can indeed be incorporated into bracelets, credit cards, passports, or many other everyday items. Some of these “tagged” items can be read by a device as far as several meters away and out of the line of site from those items.

RFID tags are typically comprised of at least two parts. One part is the integrated circuit or “chip” and it is responsible for storing and processing information. It also demodulates (decodes) and modulates (encodes) the RF signal at the heart of the device’s functions. The second major part is the antenna used for sending and receiving the radio signal. Think of this whole contraption as a super-miniature computer with an antenna. The below picture is a close-up of an RFID device. The teal colored rectangle in the middle is the “chip” and spiraling around it in concentric circles is the antenna array.

user posted image

RFID tags generally come in three different varieties:

Active – Active RFID tags contain a battery and can transmit signals without provocation. In other words, they can send out information autonomously.

Passive – Passive RFID tags contain no battery and require an external source to provoke signal transmission. In other words, passive RFID tags only “activate” when something else (like a scanning device) makes them do so.

Battery-assisted Passive – BAP RFID tags have a battery but only “wake up” with a required external

source. Having the onboard battery adds significant signal strength and reading range.

The history of the evolution of RFID is an interesting story with its genesis in Soviet Union espionage and moving into the IFF transponders used by Allies in World War II to identify aircraft as friend or foe. It wasn't until a patent in 1973 that we find the emergence of a true ancestor to what we have today. I encourage you to do a web search and read more about the history on your own.

The Basic RFID System

The process that makes the RFID system function is interesting from a technical standpoint. Understanding this basic process is fundamental to comprehending the "whole picture" of the use and potential misuse of the technology.

The simplified RFID system consists of a transponder (the RFID tag) and a reader. The reader contains an antenna that creates a short-range electromagnetic field in the radio frequency range. When a RFID tag enters this field, the antenna array/coil inside the tag generates what is called an "induction current". This induction current is enough to "power up" the RFID chip in the tag and to prompt it to announce its presence to the reader. While doing this, the RFID chip checks to see if the reader interrogating it has the right to access the coded information it stores. If the reader does have the proper access to do so, the RFID chip then calls up the required information from its memory and transmits it to the reader in some encoded form.[i]

The below image illustrates the system as implemented in many of the libraries across the country and serves as a basic example of all RFID systems.

user posted image

In the case of the use of Active RFID tags, the reader can just be in a "listening mode" and await an incoming signal from a RFID tag. Active RFID tags can be set to periodically "announce themselves" and await an answer from a reader. From that point, the communication commences normally. Obviously, these types of tags will require periodic replacement or battery changes. In the earlier prisoner tracking example, the Active RFID tags are explained like this:

"Each transmitter constantly sends off a unique signal that's captured by the antenna and then processed through the computer system, which determines where the subject is at each two-second interval."

Advances in the Technology

As with any technology, manufacturing companies seek to make products more cheaply and they seek to make the manufacturing process simpler. In the case of "embedded devices" or "wearable technologies", the manufacturer also seeks to make products smaller and less obtrusive. Think about the evolution of consumer items like the iPod. The iPod started out as a small "brick" that simply stored and played music. Now, it's a slimmer and smaller device that can be slipped into a small elastic band to fit on your arm and it sports full motion video playback and video capture in addition to music playback. Miniaturization is the name of the game. At the same time, packing more features into the smaller form factor and streamlining the functionality is the status quo for keeping ahead of the competition.

That same maxim applies to the RFID industry and Hitachi, Ltd. seems to be leading the race. I'm sure most readers will be familiar with the below image sporting the ultra-small "mu-chip" or "•-chip"

from Hitachi. ("Mu" is a Greek letter commonly used in engineering to mean "micro".) The chip (seen inside the green circle) is 0.4mm x 0.4mm in size according to the datasheet.[ii]

user posted image

Another graphic provided by Hitachi's Japanese website puts the size into perspective when compared to a grain of rice.[iii] I remember that it wasn't too long ago that they announced an RFID device the same size as a grain of rice. They've moved very fast to miniaturize it.

user posted image

Having developed this super tiny RFID tag, Hitachi has opened the door to many more uses of the technology. Their website outlines their vision quite well.

"Its unique ID numbers can be used to individually identify trillions of trillions of objects with no duplication. Moreover with a size of 0.4mm square, the µ-chip is small enough to be attached to a variety of minute objects including embedding in paper.

Manufacturing, distribution and tracking systems can be built or enhanced using the µ-chip with an event-driven accumulation of, and on-demand access to, information stored in a database through the network. By coupling this database with the versatility of the µ-chip new business and lifestyles applications can now be brought to reality."[iv] (emphasis added)

I mentioned that I'm sure some of you have seen the above close-up image of the mu-chip on a human thumb. I happened to get this image forwarded to me in several emails claiming that it was now possible to put this "RFID dust" into a vaccine shot. Hence, the mu-chip would simply be injected into your body and you are tagged! I love a good conspiracy story as much as the next guy, but this just isn't the case. This little RFID device requires an external antenna[v] to function and that antenna must be much bigger than the little speck of dust in the picture. Again, we can refer to the product data sheet for more information:

Optimized External Antenna Length ~ 54 mm
Optimized External Antenna width 1.5 mm
Optimized External Antenna Thickness 0.22 mm
Antenna Material COA style – Aluminium foilTCP style – Copper foil
Antenna substrate Polyimide or PEN film

So, with an "optimized external antenna length" of around 54 millimeters (2.13 inches), the actual size of a working mu-chip system is much larger and would hardly be deployable through a syringe.

In a way, Hitachi is to blame for the assumption made by vaccine watchdogs. Hitachi is guilty of the same advertising hype that Intel used when touting their newer and smaller CPUs for computers. The image at the left below is the hyped-up super-miniature size of a typical CPU as advertized. The image on the right shows the actual size of an implemented device with the required heat sink, cooling fan, casing material, etc. to actually use the thing. There's quite a difference between the technical size of the device and an actual, real-world usable one.

user posted image

However, we're not here to discuss the injection of RFID tags. We're here to talk about the feasibility

of using RFID bracelets that can't be removed… on an entire population!

RFID Readers

The second major component of an RFID system is the reader. This is the device that communicates with the RFID tag that is attached to or embedded within an item. RFID readers can be hand-held devices, wall-mounted devices, or even be built into a door frame of a building. In the above prisoner example, the readers are network-attached "antennas" placed throughout the facility.

If you work at a company that has employee "identification cards" that you hold up to a wall-mounted device to gain entry to the building or to gain entry to a room within that building, you probably already have an RFID device in your possession and use it daily. The box on the wall that you hold your ID up to is the RFID "reader". If you carry a new U.S. Passport, you have an RFID-enabled passport.[vi]

In most systems, the RFID reader is a rather "dumb" device that acts as the agent between the RFID tagged item and a larger computer system with a database. The reader handles the interaction with the RFID tag and even participates in simple Public Key Infrastructure[vii] data encryption, but it must talk to a larger computer to pass off the information for it to be usable. In other words, the reader acts much like a translator between two people who do not speak the same language.

RFID readers can also act as RFID "writers" to program RFID tags that can be written to. Not all RFID tags can be written. Some are "read-only". We'll discuss that more in a bit.

RFID readers come in a variety of formats. Below are some examples of RFID readers in use today.

user posted image

What Data Can RFID Tags Contain?

The size of the RFID tag as well as the intended use seems to be the determining factor for what information is actually "stored" on the device. In the case of electronic passports, we are told quite clearly what information it holds:

"An Electronic Passport is the same as a traditional passport with the addition of a small integrated circuit (or "chip") embedded in the back cover. The chip stores:
The same data visually displayed on the data page of the passport;
A biometric identifier in the form of a digital image of the passport photograph, which will facilitate the use of face recognition technology at ports-of-entry;
The unique chip identification number; and
A digital signature to protect the stored data from alteration."[viii]

For simpler devices, like the mu-chip, the tag only contains 128 bits of data. That is hardly enough memory space to contain more than a reference number to be looked up in a database to retrieve correlating data. Some tags are "hard-coded" by the manufacturer with a unique "serial number" and they only communicate that number when queried by the reader.

The United States Department of Defense has mandated its RFID Policy and according to the documentation, suppliers must put passive RFID tags on the smallest possible piece/parcel/pallet/part packaging.[ix] The specifications for these passive devices have been upgraded from 64-bit encoding to 96-bit encoding.[x] Again, that doesn't provide much memory space for more than a reference number to be looked up elsewhere.

In short, RFID tags can be larger, more complex devices containing data similar to what a passport contains or they can be cheaper and smaller and contain a unique identification number that must be used to retrieve the data from another system.

About Those Bracelets

Let's presume for a moment that both videos hit on a true plan to implement RFID tracking of United States citizens. What kind of RFID device would likely be used? Would it be passive, active, or semi-passive? Would it store a bunch of data about the individual wearing the device or would it merely have a hard-coded serial number in it?

These are difficult questions to answer from what we are told in the videos. One promising point (promising in regard to figuring this out) was made by Mr. Evensen. He claimed, "…in the case of a medical specialist in Milwaukee, Wisconsin, told me that they had observed a semi tractor-trailer being unloaded at the hospital loading dock – pallets and pallets, scores of cases of metal bracelets…" If this is true, there must be other hospitals around the country receiving (or already have in their possession) similar shipments. If you have access to any such shipment, TAKE PHOTOS AND SEND THEM TO US TO EVALUATE WHAT YOU ARE SEEING! Both Mr. Evensen and the lady in the other video make similar claims to what data is held in these devices. Mr. Evensen goes on to say, "On top is a chip. That chip will include all kinds of information about you – the fact that you had been inoculated." The woman in the first video states, "… and it tells them that you've taken the swine flu vaccine…"

It is entirely possible that these two people are jumping to conclusions about the technology. This is an easy mistake to make for someone who does not understand RFID. It could be that the device is a simple device that only holds a unique serial number which can be used to find out all of that information by querying a database. It would take a MASSIVE effort to roll out bracelets that contain huge amounts of medical data to each and every person receiving a mandatory H1N1 vaccination.

Think about the implementation of the system as Mr. Evensen describes it. In order to program all of those bracelets as described, the person or persons administering the vaccine will have to have a customized reader/writer device and access to the patient's medical records. The person administering the vaccine must then "transfer" the updated medical records to the bracelet device. Now, multiply this to cover each and every "vaccination site" across the country. This is a huge, expensive, and time-consuming task.

Again, presuming that the use of RFID bracelets is indeed the plan, the scenario could be like this:
The United States Government contracts with a supplier to provide a huge number of metal RFID bracelets. (Shouldn't we be able to find purchase records for this?)
The RFID devices attached to these bracelets are the cheapest and most effective device requiring the least amount of maintenance. This would mean the RFID tag would be a passive device but it would be both readable and writable.
The RFID device stores the minimum amount of data needed to be effective. At the minimum, this would be the wearer's name, address, and unique identifier
The government sets up a new, separate "tracking database" to be used for "lookups" when a RFID reader queries a bracelet AND for "authorized vaccination centers" to enter newly vaccinated patients
At the time of vaccination, the person administering the vaccine records the unique identifier number on paperwork and/or enters your personal data into the new government tracking database verifying that you had the vaccine.
The RFID device is programmed with your name and address. (It already has a unique identifier hard-

coded at the factory.)
The bracelet is attached to you.

That seems to be the simplest and most trouble-free way to implement this kind of thing on a very large scale.

Now, what happens when you get stopped at a checkpoint as described in both videos?
You are approached by an official of some sort carrying a handheld RFID reader
Your device is queried and you are asked for proof of your identification.
The handheld device displays your name, address, and unique identifier number. The device optionally does a quick check against the database to verify that the unique identifier is valid. The ID you provided is compared to what the handheld reader displays.
There is no need to look up anything else from a central database at this point. If you have proof of identification that matches what the bracelet says, it is presumed you have the vaccine. (How else would you get the government-issued bracelet programmed to say who you are?)
If you act suspicious or you do not have proof of identity, the official uses the handheld to query the government database for more information.
In a few seconds, the handheld displays a picture and any other pertinent information about you so the official can further identify you. (They also receive proof of your vaccination.)
If your device fails to identify you or it is malfunctioning, you might be detained until proof of vaccination or identity can be provided. I would presume that a bracelet in this scenario would also have the unique identifier number etched onto it somewhere so it could be manually entered into the handheld scanner. (Think of how a UPC code works at a department store. If it cannot be scanned, the cashier can always type in the UPC code.)
If nothing works or the information doesn't match, you will be detained, (re)vaccinated, or worse.

The heart of this system is the government database. However, in the above postulated protocol, querying the database isn't necessary unless there is a problem at the checkpoint. Simply getting the bracelet to communicate your name, address, and identifier is enough for a rudimentary and time-efficient check.

Again, it is certainly possible for the device to provide a digital photo of you like passports do. It would just add a level of complexity at the vaccination location to take your picture and program the bracelet to store that picture. The scenario I propose is not just possible… it is relatively inexpensive and simple.

Can You Defeat The RFID Bracelet System?

Can't I just kill the device? It is entirely possible to destroy an RFID device. As a matter of fact, it is extremely simple to do… even if it is "permanently" attached to you via a metal bracelet.

If an RFID tag is not attached to you, you can simply pop it in a microwave oven for a few seconds and the device will be destroyed. [xi] The high-energy radio frequency (HERF) field overwhelms the RFID chip and burns it out. Alternatively, you can just whack the RFID chip with a hammer.[xii]

However, if the device is attached to your wrist, you can't easily put your arm in a microwave oven and bake it. (Not to mention, that method is NOT recommended!) It also isn't easy and it is most likely painful to hit the device with a hammer. Plus, the device may show physical signs of being tampered with. If bracelets are implemented, it will probably be very bad (if not illegal) to have a "tampered with" device. The German branch of the "global guerilla innovation network[xiii]", which is a privacy activist group, developed an RFID-zapper that emulates the microwave oven method in a portable device.[xiv]

The RFID-zapper is constructed by modifying a standard film camera converting it into a short-range RFID-killing device.[xv]

But, is zapping your RFID tag the best thing to do? In my above protocol, having an unreadable device doesn't solve anything. In the worst case scenario, if the device fails and the person at the checkpoint cannot verify that you've been vaccinated, you're in for trouble (apparently). If you've been vaccinated already and you can't prove it, you're likely to get another dose of the vaccine.

So what? I'll just cut the thing off and throw it away. If you already have the device, you've been vaccinated according to the descriptions of the plan in the videos. You're already in the system. The only conceivable reason I could think of to remove it once it has been issued to you is over privacy concerns and the ability of the government to track your movements. I think that's a valid concern if this plan comes to reality. However, the same pitfalls exist as the above scenario where a person just zaps their bracelet. What happens when you do get to a checkpoint and you have to give up identification and you DON'T have your issued bracelet? Would you be in trouble for "destroying Federal property" or tampering? Would you be considered a "problem citizen" for protesting the bracelet by cutting it off?

I don't know the answers about this, but once you are tagged you are in the "system" and trying to avoid the "system" by removing your tag could have serious consequences.

What about "cloning" or "skimming" someone else's bracelet? I don't think that would work, either. The purpose of a unique identifier is that it could be used to look up more information about the wearer. Even if you memorized the basic information (like the name and address) of the person who's bracelet you cloned, there is always the chance that the official would query the government database and ask you something you could not answer or worst yet, have a picture that doesn't look like you. Plus, what if that person you cloned information from was being queried 200 miles away from your location at another checkpoint – at the same time? A savvy programmer would have built into the government system such safeguards. A warning would be displayed to the person at the checkpoint that someone with the same bracelet ID just got scanned. Now, you are both in trouble.

What happens if you get someone to steal a box full of those bracelets before they are used? Couldn't you program them yourself? In my proposed protocol, it wouldn't really matter. With the heart of the system being the government database, the stolen bracelets and associated unique identifier numbers wouldn't have valid entries in the database. You would always be at risk of having the person at the checkpoint query the database and nothing would be returned. (Or worse, the associated identifier would come back as "stolen" and you would be detained.) Furthermore, programming the bracelet to have your personal information may be impossible without stealing a RFID reader/writer along with the box of bracelets. As we can see from the FAQ page about U.S. passports, the use of Public Key Infrastructure, BAC (Basic Access Control), and other security measures make it difficult to program your own passport chip. (It can be done, however.)[xvi]

What Can You Really Do, Then?

After thinking about the above scenarios, it seems that there may not be a way to do anything once you are tagged with a bracelet. I think that's true and that brings this article to my conclusions about RFID and what we can actually do about it… before we are individually tagged.

I'm reminded of a line from the old movie "Wargames". During the dramatic end of the movie, the WOPR computer started playing simulations for all possible scenarios of "Global Thermonuclear War" before launching the United States' missiles. After WOPR finds that all possible scenarios end in a

stalemate and nuclear war is a pointless exercise, it stands down and states, “A strange game. The only winning move is not to play.”

That is my only real answer to this scenario of H1N1 “Global Thermonuclear War” if the government attempts to implement RFID bracelets. We will quickly find ourselves in a stalemate if we have to wear the bracelets. I think the answer is to not play the game at all. Simply, I believe that we should avoid this kind of move by our government at all costs.

The only way we can avoid the dangerous “what if scenarios”, some of which I listed above, is to not be a pawn in the game. If RFID is going to be implemented, GET OUT OF TOWN. If checkpoints and roadblocks are instituted, avoid them and SPREAD THE WORD to others so they can avoid them. Inform people right away if you EVER see one of these.

By now, we should all have “bug out plans” in place and supplies to take care of ourselves. If for no other reason, we should have these supplies and plans in the event of a natural disaster. If you don’t have these things, PREPARE NOW. I’d rather see that you prepared and didn’t need anything rather than see you caught unprepared for a worst-case scenario.

BUT, the above “GET OUT OF TOWN” plan presumes that we’re already seeing the bracelets come out of the shadows and get attached to people. We (as activists and voters) have some time left to be heard and to let our lawmakers know that WE WILL NOT STAND FOR THIS KIND OF ACTION.

Speak loudly and start to ask questions. Call your lawmakers or your local and state governments and ask if there are any tracking plans like this in place. Start a storm of concerned citizens trying to get answers. GET INVOVLED AND GET TO THE BOTTOM OF IT NOW!

We can see results. Just look at how the story about the “American Police Force” fiasco unfolded in Hardin, Montana. Citizens and alternative media started to ask questions and bombard people with demands for answers. In a little under two weeks, concerned people all over this country got the jump on a terrible situation and quite possibly diffused it. Mainstream media outlets were “scooped” by citizen reporting and alternative websites and are now covering the story AFTER THE FACT!

We need that kind of action to get answers to this H1N1 RFID bracelet story. Otherwise, we’re all pondering the “what if scenarios” and we may be caught off-guard just like the people of Hardin were when black Mercedes SUVs rolled into town sporting the APF logo with the words “City of Hardin Police Force”.

Furthermore, we need tangible evidence of the existence of this plan. We need pictures of the actual bracelets. We need people to tell us what they know. We need to see what is really happening instead of videos of individuals telling us what they believe is happening.

Don’t get me wrong. I applaud these people if they are speaking the truth and not just hyperbole. If they are indeed speaking the truth, this is our story… all of us. Grab it and own it like the Hardin story and let’s get to the bottom of it before it is too late.

Please get involved and COMMENT!

kalongi - October 22, 2009 09:45 AM (GMT)

VeriChip Corporation and RECEPTORS LLC to Unveil Development Details of Virus Triage Detection System for the H1N1 Virus and In Vivo Glucose-Sensing RFID Microchip at Grand Hyatt in New York on October 22

http://www.nasdaq.com//aspxcontent/newssto...2F2009+9%3A00AM

DELRAY BEACH, Fla. & CHASKA, Minn.--(BUSINESS WIRE)-- VeriChip Corporation ("VeriChip") (NASDAQ:CHIP) and its development partner RECEPTORS LLC ("RECEPTORS"), a technology company whose AFFINITY by DESIGN™ chemistry platform can be applied to the development of selective binding products, announced today they will host an event for the medical, patient and investor communities on October 22, 2009, in New York to unveil details of their virus triage detection system for the H1N1 virus and Phase II development of an in vivo glucose-sensing RFID microchip. The companies will also provide a product demonstration of the virus triage detection system currently being developed.

The event will take place at the Grand Hyatt at 4:30 p.m. ET and feature a presentation by Robert E. Carlson, Ph.D., President and Chief Science Officer of RECEPTORS LLC, and an expert in the field of proteomics and the development of artificial receptors. Parties interested in attending the New York event should contact Allison Tomek at (561) 805-8008 or at atomek@verichipcorp.com as soon as possible. Space is limited and registration will be accepted on a first-come, first-served basis.

The virus triage detection system is intended to initially provide two levels of identification within minutes. Once developed, utilizing a simple test tube or strip device format that can be combined with an inexpensive reader, it is expected that the first level will prep the sample and identify the agent as a flu or non-flu virus, and the second level will sub-type (e.g. H1N1) classify the flu virus and alert the user to the presence of pandemic threat viruses. Additionally, VeriChip believes the influenza triage diagnostic system will be scalable and will be able to be rapidly adapted to identify new strains of influenza and other viruses as they evolve, giving the virus triage detection system value for future testing applications in healthcare.

VeriChip previously announced in November 2008 that RECEPTORS completed Phase I of the

project, which demonstrated the proof-of-concept foundation of the glucose-sensing system. The companies expect Phase II will demonstrate a glucose concentration response in the presence of blood and interstitial fluid matrix components. The companies published a white paper entitled, "Development of an Implantable Glucose Sensor," which outlines the product's development and is available at www.verichipcorp.com.

About RECEPTORS LLC

RECEPTORS LLC develops SMART MATERIALS products for laboratory, clinical, industrial hygiene and healthcare use that selectively capture and measure chemical, biochemical and cellular targets from complex biological, environmental or industrial samples. The Company's patented AFFINITY by DESIGN™ platform has broad applicability, ranging from the isolation of disease pathway proteins for drug discovery and production of therapeutic antibodies, to the capture of bacteria and viruses for disinfection and diagnostic purposes. RECEPTORS LLC is a private company based in suburban Minneapolis, Minnesota. For further information please visit http://www.receptorsllc.com.

About VeriChip Corporation

VeriChip Corporation, headquartered in Delray Beach, Florida, has developed the VeriMed™ Health Link System for rapidly and accurately identifying people who arrive in an emergency room and are unable to communicate. This system uses the first human-implantable passive RFID microchip and corresponding personal health record, cleared for medical use in October 2004 by the United States Food and Drug Administration.

On September 8, 2009, VeriChip Corporation announced it agreed to acquire Steel Vault Corporation (OTCBB:SVUL) to form PositiveID Corporation. PositiveID will provide identification technologies and tools to protect consumers and businesses. The companies expect the merger to close in the fourth quarter of 2009.

For more information on VeriChip, please call 1-800-970-2447, or e-mail info@verichipcorp.com. Additional information can be found online at www.verichipcorp.com.

Statements about VeriChip's future expectations, including its development of a triage detection system, the expectation that the triage detection system, if developed, will function as intended, including the ability to provide two levels of identification within minutes, and be a marketable product, the belief that the influenza triage diagnostic system will be scalable and will be able to be rapidly adapted to identify new strains of influenza and other viruses as they evolve, giving the virus detection triage system value for future testing applications in healthcare, the expectation that Phase II will demonstrate a glucose concentration response in the presence of blood and interstitial fluid matrix components, the ability of RECEPTORS LLC to complete the Phase II goal, and all other statements in this press release other than historical facts are "forward-looking statements" within the meaning of Section 27A of the Securities Act of 1933, Section 21E of the Securities Exchange Act of 1934, and as that term is defined in the Private Litigation Reform Act of 1995. Such forward-looking statements involve risks and uncertainties and are subject to change at any time, and VeriChip's actual results could differ materially from expected results. These risks and uncertainties include the Company's ability to successfully develop and commercialize the microchip, the market acceptance of the microchip, the Company's and RECEPTORS' ability to develop a microchip, the validity, scope and enforceability of the Company's patents and those related to the microchip, the protection afforded by the Company's patents and those related to the microchip, the Company's ability to complete the development phases in certain time frames, government regulations relating to the microchip, the Company's ability to fund the continued development of the microchip, the timing and success of

submission, acceptance and approval of required regulatory filings; as well as certain other risks. Additional information about these and other factors that could affect the Company's business is set forth in the Company's various filings with the Securities and Exchange Commission, including those set forth in the Company's 10-K filed on February 12, 2009, under the caption "Risk Factors." The Company undertakes no obligation to update or release any revisions to these forward-looking statements to reflect events or circumstances after the date of this statement or to reflect the occurrence of unanticipated events, except as required by law.

Additional Information and Where to Find It

On September 8, 2009, VeriChip and Steel Vault issued a joint press release announcing the signing of an Agreement and Plan of Reorganization, among VeriChip, Steel Vault and VeriChip Acquisition Corp., a Delaware corporation and wholly-owned subsidiary of VeriChip (the "Acquisition Subsidiary"), pursuant to which the Acquisition Subsidiary will be merged with and into Steel Vault, with Steel Vault surviving and becoming a wholly-owned subsidiary of VeriChip (the "Merger"). Upon the consummation of the Merger, each outstanding share of Steel Vault's common stock will be converted into 0.5 shares of VeriChip common stock.

In connection with the Merger, VeriChip filed with the Securities and Exchange Commission ("SEC") a Registration Statement on Form S-4 that will contain a Joint Proxy Statement/Prospectus of VeriChip and Steel Vault. Investors and security holders are urged to read the Registration Statement and the Joint Proxy Statement/Prospectus carefully because they contain important information about VeriChip, Steel Vault and the proposed transaction. The Joint Proxy Statement/Prospectus and other relevant materials (when they become available), and any other documents filed with the SEC, may be obtained free of charge at the SEC's web site (www.sec.gov). In addition, investors and security holders may obtain a free copy of other documents filed by VeriChip or Steel Vault by directing a written request, as appropriate, to VeriChip at 1690 South Congress Avenue, Suite 200 Delray Beach, Florida 33445, Attention: Investor Relations, or to Steel Vault at 1690 South Congress Avenue, Suite 200 Delray Beach, Florida 33445, Attention: Investor Relations. Investors and security holders are urged to read the Joint Proxy Statement/Prospectus and the other relevant materials before making any voting or investment decision with respect to the proposed transaction.

VeriChip, Steel Vault and their respective directors and executive officers may be deemed to be participants in the solicitation of proxies in connection with the proposed transaction.

Information regarding the interests of these directors and executive officers in the proposed transaction will be included in the Joint Proxy Statement/Prospectus referred to above. Additional information regarding the directors and executive officers of VeriChip is also included in VeriChip's Form 10-K, which was filed with the SEC on February 12, 2009. Additional information regarding the directors and executive officers of Steel Vault is also included in Steel Vault's proxy statement (Form DEF 14A) for the 2009 annual meeting of Steel Vault's stockholders, which was filed with the SEC on February 9, 2009, as amended. These documents are available free of charge at the SEC's website (www.sec.gov) and by contacting Investor Relations at the addresses above.

Are Populations Being Primed For Nano-Microchips Inside Vaccines?

Friday, 30 October 2009 16:50
http://preventdisease.com/news/09/100509_i...icrochips.shtml

It's almost surreal, like something out of a sci-fi flick, but nano-microchips invisible to the naked eye are a reality that are already being hosted in wide-range of applications. The question is, how long will it take governments and big pharma to immerse nano-microchips inside of vaccines to tag and surveil global populations?

Nanotechnology deals with structures smaller than one micrometer (less than 1/30th the width of a human hair), and involves developing materials or devices within that size. To put the size of a nanometer in perspective, it is 100,000 times smaller than the width of a human hair.

More than ten years ago, simple low-cost techniques improved the design and manufacture of nano-microchips. That unlocked a multitude of methodologies for their manufacture in a wide-range of applications including optical, biological, and electronic devices.

The joint use of nanoelectronics, photolithography, and new biomaterials, have enabled the required manufacturing technology towards nanorobots for common medical applications, such as surgical instrumentation, diagnosis and drug delivery.

Japan's Hitachi says it has developed the world's smallest and thinnest microchip, that can be embedded in paper to track down parcels or prove the authenticity of a document. The integrated circuit (IC) chip is as minute as a speck of dust.

Nanoelectrodes implanted in the brain are increasingly being used to manage neurological disorders. Mohammad Reza Abidian, a post-doctoral researcher at the U-M Department of Biomedical Engineering said that polymers in nanotubes "are biocompatible and have both electronic and ionic conductivity." He further stated "therefore, these materials are good candidates for biomedical applications such as neural interfaces, biosensors and drug delivery systems."

Depending on the objectives of such studies, research could theoretically pave the way for smart recording electrodes that can deliver drugs to positively or negatively affect the immune response.

Through nanotechnology, researchers have also been able to create artificial pores able to transmit nanoscale materials through membranes.

A UC biomedical engineering study appearing in the journal Nature Nanotechnology, Sept. 27, 2009, successfully inserted the modified core of a nanomotor, a microscopic biological machine, into a lipid membrane. The resulting channel enabled them to move both single- and double-stranded DNA through the membrane.

Professor Peixuan Guo who led the study said past work with biological channels has been focused on channels large enough to move only single-stranded genetic material.

"Since the genomic DNA of human, animals, plants, fungus and bacteria are double stranded, the development of single pore system that can sequence double-stranded DNA is very important," he says.

Such engineered channels could have applications in nano-sensing, DNA sequencing, drug loading,

including innovative techniques to implement DNA packaging mechanisms of viral nanomotors and vaccine delivery.

"The idea that a DNA molecule travels through the nanopore, advancing nucleotide by nucleotide, could lead to the development of a single pore DNA sequencing apparatus, an area of strong national interest," Guo said.

Scientists working at Queen Mary, University of London, have developed micrometer-sized capsules to safely deliver drugs inside living cells. These "micro shuttles" could hypothetically be loaded with a specific microchip controlling the dose of medication to be opened remotely, releasing their contents. Besides monitoring the dosage, the same microchip could be used to surveil the patient in conjunction with various tracking systems.

Scientists in the United Kingdom have recently reported advances towards overcoming key challenges in nanotechnology. They demonstrated how nanoparticles could move quickly in a desired direction without help from outside forces. Their achievement has broad implications, the scientists say, raising the possibility of coaxing cells to move and grow in specific directions.

Doug Dorst, a microbiologist and vaccine critic in South Wales, says these advances have an immense appeal to vaccine makers. "Biotech companies and their researchers have quickly moved most funding initiatives towards nanotechnology to increase the potency of their vaccines," he said. If microorganisms inside of vaccines can be coaxed into targeting or invading specific cells, they could achieve their goal at an accelerated rate over conventional vaccines. "Depending on which side of the vaccine debate you're on, whether pro or con, nanobots inside vaccine preparations could advance their effectiveness exponentially by either dramatically improving or destroying immunity depending on their design," he added.

Dorst claims that present day nanobot technology could just as easily be used to advance biological weapons as they can to advance human health. "For every fear that biotech propaganda proliferates about deadly diseases and how vaccines prevent them, it is one more lie to incrementally convince the masses that vaccines are effective."

The worry for Dorst is that one day vaccines "will do what they've always been intended for...control of the global populace."

Nanoemulsion platforms are already capable of developing vaccines from very diverse materials. Mixtures of soybean oil, alcohol, water and detergents can be emulsified into ultra-small particles smaller than 400 nanometers wide (about 1/200th the width of a human hair). These could be combined with any number of nano-microchips with all or part of disease-causing microbes to trigger the body's immune system.

In 2007 researchers at the Ecole Polytechnique Fédérale de Lausanne (EPFL) announced in an article in the journal, Nature Biotechnology, that they had developed a “nanoparticle that can deliver vaccines more effectively, with fewer side effects, and at a fraction of the cost of current vaccine technologies.” The article went on to describe the effects of their breakthrough: “At a mere 25 nanometers, these particles are so tiny that once injected, they flow through the skin’s extracellular matrix, making a beeline to the lymph nodes. Within minutes, they’ve reached a concentration of DCs thousands of times greater than in the skin."

Russia has recently announced a new manufacturing plant that will strictly produce nano-vaccines. Project plans include development of two vaccines for human flu and bird flu and three

biopharmaceuticals for boosting the immune system and increasing the efficiency of antibacterial and antiviral drugs, among other initiatives.

The human body is very resistant to nanoparticles that attempt to invade human cells. Scientists are intensely investigating methods to disrupt human enzymes that may degrade nanoparticles. Experts at the University of Liverpool found a way around this obstacle that could mean more efficient, topical drugs in the future, which could act a whole lot faster than the ones currently in use.

All these nanotechnological advances raise many issues and concerns about the toxicity and environmental impact of nanomaterials, and their potential effects on medicine, global economics, as well as speculation about government surveillance. These concerns have led to a debate among advocacy groups and governments on whether special regulation of nanotechnology is warranted.

The Environmental Protection Agency issued a news release last week saying that it had “today outlined a new research strategy to better understand how manufactured nanomaterials may harm human health and the environment.” Interesting as that strategy document is, it was hardly hot off the presses.

Indeed, many companies advertise their use of such billionth-of-a-meter-scale constituents as a measure of a product's state-of-the-art status, implying that ultra-small ingredients are an inherently good thing. They aren’t. Nor does size necessarily make these materials worse than others. At this point it's just maddeningly unpredictable what nano things will do.

Proponents of nanotechnology are very critical of regulatory measures that may impeed its progression. Many of these critics have staunchly dismissed concerns as being fear-hyped conspiracy theories based on science fiction.

In the popular video game series Metal Gear Solid, many characters and soldiers in general, have "nanomachines" in their bloodstream, and are used to block pain, allow members of fire teams/patrols to share sensory information, heal bodily damage, as well as manipulating viruses central to video game's plot line.

Through the use of special effects and computer-generated imagery, several blockbusters starring Keanu Reeves including The Matrix Trilogy and The Day the Earth Stood Still, have dramatized how nanobots could effectively take control of their organic and inorganic targets.

Star Trek episodes and their theatrical releases such as Star Trek: First Contact have also depicted how nanoprobes (nanites) could infect an individual's bloodstream through a pair of tubules.

Regardless of the recurring themes of nanobots in video games, sci-fi shows and movies, nanotechnology is a reality, and nano-microchips are well on their way to being utilized in ways which may be detrimental to human health and freedom on a global scale.

The development of nano-microchips are a major thrust of governments and pharmaceutical industries who want the ultimate power and leverage over global populations for more profit and more control.

In December 2000, Former Chief Medical Officer of Finland, Rauni-Leena Luukanen-Kilde, MD stated that it is technically possible for every newborn to be injected with a microchip, which could then function to identify the person for the rest of his or her life. Such plans are secretly being discussed in the U.S. without any public airing of the privacy issues involved.

Today's microchips operate by means of low-frequency radio waves that target them. With the help of satellites, the implanted person can be tracked anywhere on the globe. Such a technique was among a number tested in the Iraq war, according to Dr. Carl Sanders, who invented the intelligence-manned interface (IMI) biotic, which is injected into people. (Earlier during the Vietnam War, soldiers were injected with the Rambo chip, designed to increase adrenaline flow into the bloodstream.) The 20-billion-bit/second supercomputers at the U.S. National Security Agency (NSA) could now "see and hear" what soldiers experience in the battlefield with a remote monitoring system (RMS).

When a 5-micromillimeter microchip (the diameter of a strand of hair is 50 micromillimeters) is placed into optical nerve of the eye, it draws neuroimpulses from the brain that embody the experiences, smells, sights, and voice of the implanted person. Once transferred and stored in a computer, these neuroimpulses can be projected back to the person’s brain via the microchip to be reexperienced. Using a RMS, a land-based computer operator can send electromagnetic messages (encoded as signals) to the nervous system, affecting the target's performance. With RMS, healthy persons can be induced to see hallucinations and to hear voices in their heads.

Every thought, reaction, hearing, and visual observation causes a certain neurological potential, spikes, and patterns in the brain and its electromagnetic fields, which can now be decoded into thoughts, pictures, and voices. Electromagnetic stimulation can therefore change a person's brainwaves and affect muscular activity, causing painful muscular cramps experienced as torture.

The NSA's electronic surveillance system can simultaneously follow and handle millions of people. Each of us has a unique bioelectrical resonance frequency in the brain, just as we have unique fingerprints. With electromagnetic frequency (EMF) brain stimulation fully coded, pulsating electromagnetic signals can be sent to the brain, causing the desired voice and visual effects to be experienced by the target. This is a form of electronic warfare. U.S. astronauts were implanted before they were sent into space so their thoughts could be followed and all their emotions could be registered 24 hours a day.

The mass media has not reported that an implanted person's privacy vanishes for the rest of his or her life. S/he can be manipulated in many ways. Using different frequencies, the secret controller of this equipment can even change a person's emotional life. S/he can be made aggressive or lethargic. Sexuality can be artificially influenced. Thought signals and subconscious thinking can be read, dreams affected and even induced, all without the knowledge or consent of the implanted person.

This secret technology has been used by military forces in certain NATO countries since the 1980s without civilian and academic populations having heard anything about it. Thus, little information about such invasive mind-control systems is available in professional and academic journals.

The NSA's Signals Intelligence group can remotely monitor information from human brains by decoding the evoked potentials (3.50HZ, 5 milliwatt) emitted by the brain. Prisoner experimentees in both Gothenburg, Sweden and Vienna, Austria have been found to have evident brain lesions. Diminished blood circulation and lack of oxygen in the right temporal frontal lobes result where brain implants are usually operative. A Finnish experimentee experienced brain atrophy and intermittent attacks of unconsciousness due to lack of oxygen.

Targeting people’s brain functions with electromagnetic fields and beams (from helicopters and airplanes, satellites, from parked vans, neighboring houses, telephone poles, electrical appliances, mobile phones, TV, radio, etc.) is part of the radiation problem that should be addressed by democratically elected governments. However, there is currently no interest by any national government to seriously address this issue.

The timeline for integrating nano-microchips inside of vaccines is speculative. It could be just a few years, months or perhaps it is here and we already unaware of their integration within pharmaceuticals. Regardless, due to the many military and political advantages, their implementation is inevitable.

However fraudulent, it was an imperative for world powers and pharmaceutical cartels to promote the effectiveness of vaccinations and enact national pandemic preparedness policies which mandate vaccinations.

In 2005 the World Health Organization (WHO) developed international health regulations that would bind all 194 member countries to pandemic emergency guidelines which could enforce such a mandate. Without these procedures of public health (and propagandized vaccine campaigns) in place, there would be little or no voluntary cooperation from the public to roll up their sleeves and accept the inoculations. Public participation is an essential tool that will soon allow big pharma to inject the most effective surveillence tool ever designed into billions of people.

Although nanotechnology manufacturing is currently available on a global scale, before biotech companies are able to initiate mass production and testing of nano-microchips inside of vaccines, they will likely sell the idea to the public. Through various "health enhancement scenarios" they will encourage participation and publicly announce regulatory approval from the same policies and regulatory agencies they helped create.

By mid-summer of 2009, the WHO and the Center of Disease Control (CDC) effectively hyped a false flu pandemic and convinced the world to submit to H1N1 vaccines. Additional doses of propaganda and possibly a biological event, may equally convince populations to knowingly accept microchips inside of vaccines under the guise of a "greater good" for humanity.

When our brain functions are already connected to supercomputers by means of radio implants and microchips, it will be too late for protest. This threat can be defeated only by educating the public, using available literature on biotelemetry, nanorobotics and information exchanged at international congresses.

The time to act is now!

Flashback: UK newspaper reports on plan to chip people under swine flu jab pretext in 1989

Tuesday, 03 November 2009 10:29

http://ronpaul.blog.de/2009/10/28/zeitungs...mpfung-7264434/

The UK newspaper "The Sun" carried a prophetic report on 1. August 1989 with the headline "Big Brother's Coming" outlining secret government plans to implant microchips, also under the pretext of a swine flu pandemic, into every person in order to obtain total control of populations.

The report could have been written today as governments prepare to implement mass "swine flu" vaccinations with an untested and toxic jab and many sources say there will be a nanochip in the syringes to be issued by governments.

BIG BROTHER'S COMING!

Revealed: Secret plan to tag every man, woman and child

CODED MICROCHIPS implanted in every person in the country would tie all of us into a master computer that could track anyone down at any moment, and plans for such a system are already under way whether you like it or not!

by JOE FRIGGENTI

"The secret scheme is being touted as a service for the protection of the people by high government officials, but some insiders who object to the move say it's just another way for Big Brother to control its vcia.

Transmitters

"Top-level national security agents are trying to convince sources in the Bush Administration to begin the project in which every man, woman and child will be implanted with a tiny transmitter," claims Davis Milsrand, a critic of government intervention who says he has secured leaked information from inside sources.

"They're trying to sell this will be a good way for authorities to quickly track down missing persons and children, as well as criminals and spies.

Injections

"But with the advanced technology of today, everything about you could be contained in one tiny microchip, which would be connected to a government computer.

"Any government agency will know what any person has done and is doing at any time."

Other sources say the tiny transmitters can be injected painlessly from a tiny gun in humans without them even knowing it through a nationwide "nation" program.

...all the government would have to do is make up something like the swine flu vaccine," Milsrand says.

"Imagine if they said there was a vaccine for AIDS. People would rush in droves to get shots.

"The doctors themselves may not even know what they're injecting. They could be told the microchips are genetic implants that reprogram the body into fighting disease."

He adds: "The program would require all federal, state and local government workers to undergo the injections.

"It would only be a matter of time before everyone is implanted with a microchip, a slave to the government."

• TINY MICROCHIPS containing transmitters could be injected painlessly in humans with a small gun like this

No-sleep diet keeps you wide awake

IF YOU THINK there just aren't enough hours in the day, you can now get added time — thanks to a revolutionary new sleep method that helps people stay up nearly all night.

The new sleep system is called "Micro-Somnia," and it's billed as "The Entrepreneur's Guide to Sleep Reduction" by sleep management researcher Benjamin Plumb of Miami.

Plumb gets only 4½ hours of sleep each night and has a few brief catnaps during the day.

He says that through Micro-Somnia he hopes to introduce short sleep "as a safe viable tool for people to use in increasing productivity."

Writes

The researcher cut red meat out of his diet, eats less gooey sweets, takes daily naps and avoids doing high-impact exercises in his leisure time.

He eats stuff like beans, rice and tofu, and does light exercises like walking and yoga.

Besides his prescribed diet and exercise regimen, the tireless sleep expert says he writes down his goals for the next day before retiring for the night — so he'll wake up excited the next morning.

Plumb says his brand of sleep management is only for "highly motivated, extremely goal-driven adults" because children and pregnant women require more sleep for health reasons.

Some super successful people like Winston Churchill, Napoleon and Thomas Edison worked wonders while catching only a few winks a night, he notes.

But they were born short sleepers and their [illegible] came naturally.

Now, however, Plumb says his program can make short sleepers out of sleepaholics who [illegible] nine or 10 hours each night huddled under the covers.

He figures the best candidates for his Micro-Somnia system are corporate types who [illegible] be awake pursuing their goals than wasting their time in bed.

Hitachi's new official microchips are 63 times smaller than in 2003: come in syringes.

user posted image

Left: the older bigger size in 2003. Right: the new size compared to a human hair.

user posted image

"Syringe made of PP, with hitag s256 chip inside."

This syringe is an older model aimed at tagging animals with a much larger chip than shown above. The very small chips now commercially available are small enough to be hidden inside a syringe (numerous reports are coming in stating that the "swine flu" vaccine has to be injected using special syringes). A syringe could be loaded with such a chip without anyone being able to see it with thei bare eyes, even if they searched for it, since it is so small. One would need to search the needle and the container of the syringe using a microscope to be able to find it.

In the human body, we have received reports that the chip are able to function using the electricity within the body and the body's own electro magnetic field. If the syringe used is listed next to the person who received the shot in a database, the tagging would be successful and the individual would now be a subject of an incredible and unprecedented invasion of privacy.

If the shot is not entered into a data base together with the receiver, there are many other possible ways to connect the chip to the host. We have heard suggestions that when using an ATM machine, it could detect the chip and connect it to the card user when standing in front of the machine. Several similar scenarios are also possible.

tichan.pet - November 18, 2009 11:57 AM (GMT)

Scary

This is the mark of the beast and of the political religous system of one world order

One day you will think you get a flew shot and you won't even know that your microchiped.

In a few years no one will be able to operate without it.
There won't be any money because everything will be downloaded into your chip.

And they will control our moods and brain to do what they want

Michael Leitner calls me "mentally ill" for saying there is
evidence nano chips will be in the swine flu syringes

Friday, 20 November 2009 14:35

Michael Leitner has sent an email concerning the criminal charges to be filed against him for spreading verifiable lies about me, denying he works in the interests of Big Pharma and the banksters (a freemason?) as might be expected. Interestingly, he also claims any state prosecutor will through out my case simply because I report the evidence that nano chips will be in the swine flu jab syringes. He says to report this evidence is proof of my being mental ill and my "journalistic methods" even though anyone who does a quick google search can see that nanochips are used in syringes today, and that putting them in swine flu syringes is technically very possible. These syringes are issued by the government and each one has a bar code which is then attached to the person's medical sheet

after they have taken the jab. Since Michael Leitner has made claims about me that can be proven to be lies, spread maliciously and intentionally, he has indeed boxed himself into a corner, and personal vilification and a pathetic defence of his integrity is all that is left for him.

He even admits he has lied indirectly and reveals he has changed some of his "claims" about my donations. Leitner is just the latest after the newspapers BILD and Kurier to perform a hit piece against me, aiming to discredit the facts, documents and information that I present that the swine flu vaccines are dangerous and deliberately designed to be so when used under the pretext of a pandemic emergency. It is well known in the USA, in the meantime, that not just the corporate media but also the alternative media and anti vaccine groups are infiltrated as part of a programme to control the opposition.

It is no surprise, therefore, that the same applies to the German alternative media and anti vaccine groups. This is Leitner's email devoid of facts and logic but heavy on insults:

Sehr geehrte Jane Bürgermeister! Sie haben Recht, ich arbeite für Baxter. Ich fühle mich erleichtert, dass jemand mich endlich durchschaut hat! Ich habe Baxter bereits gebeten, mir einen neuen Wagen zu bestellen. Mein 19 Jahre alter Astra sieht ziemlich schäbig aus und am Ende geht die Aktie von Baxter in den Keller, weil Wall Street denkt: "Wenn Baxter nicht mal seine Agenten bezahlen kann, muss es um die Firma sehr finster aussehen". Ich sehe Ihrer Anzeige mehr als gelassen entgegen. Vielleicht sind Sie so nett und fügen Ihrer Anzeige meinen Artikel gleich bei, dann muss ich das nicht tun und die Anzeige geht gleich in den Papierkorb, ohne dass ich Geld für Porto aufwenden muss. Es dürfte genügen, einem Staatsanwalt ihre Behauptung von Nano-Chips in den Impfungen zu unterbreiten, damit er sich ein Bild von ihrem geistigen Zustand bzw Ihren journalistischen Methoden machen kann. Aber ich möchte Ihnen gleichzeitig versichern, dass Sie auf rein menschlicher Ebene mein tiefes und aufrichtiges Mitgefühl haben. Ich wünsche ihnen, wenn Sie irgendwann aus dieser Phase erwachen, dass Sie dann jemanden haben, der Sie auffängt und Ihnen hilft, wieder ins wirkliche Leben zurückzukehren. Den Fehler bei der Berechnung des Umfanges der Spenden habe ich im übrigen direkt nach Ihrem Hinweis bereits beseitigt. http://virushauptquartier.de/JB.pdf . Ich bitte um Verständnis, dass ich weitere Schreiben von Ihnen nicht beantworten werde. Kranke Menschen haben die Angewohnheit, andere in ihre verdrehte Welt zu verwickeln und das Leben ist zu kurz, um sich mit solchen Dingen zu befassen. Ich wünsche Ihnen alles Gute und verbleibe in Hoffnung, dass es Ihnen bald besser geht Michael Leitner

SWISS SOLDIER REPORTS PREAPARATIONS FOR FORCED
SWINE FLU VACCINATION CAMPAIGN UNDERWAY

Tuesday, 24 November 2009 20:39

A Swiss soldier serving in Bremgarten, Aargau, where military units for disaster management are stationed, has said that medical units are preparing to carry out an operation to give all Swiss soldiers the swine flu jab by force if necessary.

http://www.kaserne-bremgarten.ch/kaserne/ueberuns.html

The soldier said that a doctor at the base also explained that every swine flu jab has a special needle with a bar code.

The bar code is registered for every person who takes the jab and then sent to the Federal Ministry for Health, the Bundesamt für Gesundheit.

The military doctor said he didn't know why a special needle was needed but there are many reports of a nanochip in the needle.

The soldier said that the medical troops are preparing for a "serious scenario."

Every soldier belonging to the medical unit has to prepare to vaccinate every other soldier whether they want to be vaccinated or not in a "worst case scenario".

He said he considered forced vaccination to be inevitable.

The soldier's supports an earlier report that Swiss soldiers belonging to medical units are being called up and trained for a mass forced vaccination campaign.

This is the email in German:

Da ich momentan im Militär tätig bin, hab ich mich mal bei der Krankenabteilung auf dem Waffenplatz Bremgarten AG erkundigt, wo es zur Abwechslung gute Ärzte hat, welche nicht einfach mal in jedem Fall Schmerzmittel verschreiben. :)

Auch im Militär ist die Sau los wegen der Soiligripp. Diesen Freitag gehen alle mit Ihrem Impfausweis vorbei und können sich impfen lassen.

Nun hab ich den Chefarzt mal auf die Nadeln angesprochen. Es ist definitiv so, dass für jeden Impfling eine ganz neue, spezielle Nadel bereit steht, welche einen Strichcode enthält.

Dieser Strichcode wird für den jeweiligen Impfling registriert und schlussendlich ans BAG geschickt. Warum und wieso eine neue, spezielle Nadel benötigt wird, weiss er nicht. Ich werde sie mir diesen Freitag aber selbstverständlich genau unter die Lupe nehmen. :)

Weitere Angehörige der Armee müssen sich in Acht nehmen:

Bei den Sanitätstruppen rüstet man sich für den "Ernsteinsatz". Alle Soldaten der San Trp müssen/ mussten sich vorbereiten um in einem Ernstfall auszurücken und alle Ada's zu impfen. Und dies selbstverständlich nicht auf freiweilliger Basis. Also ist diese Aktion mehr oder weniger absehbar. Soweit meine Information.

craig-oxley - December 2, 2009 05:44 PM (GMT)

Unconfirmed Report of Nano-Microchips Found in Vaccines in Croatia

Wednesday, 02 December 2009 12:21

„I'm writing to you from Split, Croatia. This morning I received an e-mail from my best friend. His mother used to work in the Centre for Social Care in Split. One nun that presently cooperates with the Centre for Social Care and knows his mother sent out a notification this morning to her not to take vaccination against swine flu in any case because they have found microchips in the vaccine!!!"

GPS and GLONASS electronic bracelets

The day ago Assistant Justice Minister Yuri Kalinin said that he would soon own home can virtually replace prison for thousands of citizens.

This is a house arrest that the de jure already exists, but in practice is rarely used. The reason is just the absence of a mechanism. But the gathering of many questions: how to control household barman?

But, as said Yuri Kalinin, the end of this year, a similar mechanism may occur. Now the Ministry of Justice and the Interior Ministry just develop an appropriate law. He argues that to monitor home detainees and prisoners, in addition to imprisonment, without her would be deprived of all means of audio and video recordings, and in addition with the help of electronic bracelets that are connected to GPS and GLONASS.

It Yuri Kalinin asked not to confuse two quite different things: the virtual house arrest and confinement,

which came into force this year. Under house arrest or charge suspects accused, in other words, people who have not yet handed down a verdict. But because of any reason why they should be kept under control. Now these citizens are in jail only because the law enforcement agencies still do not know how to look after them in the wild. Perhaps soon discrepancy is resolved. And if the person convicted, then the period of house arrest would be counted.

Swine Flu Cured Using Chinese Herbs

INSIDER'S HEALTH by Cathy Margolin

Just a few days ago, a hospital in China published an article stating that a combination of four different herbs was able to successfully treat many people with swine flu (H1N1). This article describes these herbs.

An article released today from the Ditan Hospital in Beijing reported that, "88 out of 117 patients treated for (H1N1) the disease only on the herbs fully recovered and were discharged." This is a 75% success rate. What are these Chinese herbs that worked so well? The Deputy Director of the hospital said there were four herbs in the packets given to patients who drank them as a tea and used as a mouth wash. Lonicera Japonica, (honeysuckle flower), Isatis Indigodica, Mentha (mint) and Glycyrrhiza (licorice). All were dosed at 3 grams per serving. These same herbs are available in Chinese herbal medicine shops in the US.

The first herb, Lonicera, is used almost exclusively for prevention and treatment of the common cold and upper respiratory tract infections, sore throats and general flu symptoms. It can be used in a vaporizer and inhaled along with the traditional way of ingesting it after cooking (decocting) in water. In one study, 1150 patients were treated for influenza using a combination of herbs which included Lonicera and had excellent results. Using fresh Lonicera is best as it contains the most anti-inflammatory and antipyretic effects. As an antibiotic, it has "demonstrated a broad spectrum of inhibitory

actions against staphylococcus aureus, E. Coli" and a host of other pathogens.

The second herb in the flu fighting formula is Isatis, otherwise known as Woad root. This herb is categorized as a toxic heat clearing herb in Chinese herbal medicine and is also commonly used for upper respiratory infections. It's pharmacological effects have been well studied and research supports its success in treating acute sore throats and influenza viruses. Like other Chinese herbs, it is often used in a formula combined with other herbs. Herbs often work more effectively when cooked together with the right combination of other synergistically compatible herbs. People allergic to sulfonamides may have an allergic reaction to this herb, and it is not recommended for those taking Coumadin or any blood thinning medication as it may potentiate this action. However, the risk of any serious interaction is slight. I mention this to emphasize that herbs are strong medicine and should be prescribed and dosed by a qualified practitioner.

The last two herbs in this very simple formula are herbs that I am certain everyone has heard of, but may not have held in high regard for treatment of flu virus such as Swine flu. I hope this article changes that perspective. Although mint and licorice are fairly common, they are not necessarily found in the neighborhood grocery store. As there are hundreds of different species, you must be certain of obtaining the correct species. Mentha has quite a history when comes to treating high fever accompanied by flu symptoms. In fact, the original source text on mentha was written in approximately 600 A.D., while the beneficial effects of licorice were documented even earlier. Sore throats, red eyes, and headache are some of the most common symptoms mentha can treat. It is included in many famous Chinese herb formulas as is licorice. Both are considered GRAS (generally recognized as safe) by the FDA. Licorice is one of the most commonly used herbs in the Chinese Materia Medica with volumes of information and research. It is traditionally used to "harmonize" a formula in Chinese medicine, yet it has many therapeutic actions of its own. More than I can list here.

Together, these four powerful herbs are more than just the sum of their individual parts. Beijing Traditional Chinese Medicine Hospital has introduced a H1N1 prevention herbal medicine pack. If you are traveling to China, you may want to pick up a few. Better yet, consult your local Acupuncturist or Herbalist and get your very own powerhouse of herbs custom made for your constitution.

Using Bicarbonate Against the Swine Flu

Mark Sircus Ac., OMD
http://sodiumbicarbonate.imva.info
December 4, 2009

Over 150 years ago Dr. Austin Church formed a business to produce and distribute Baking Soda. ARM & HAMMER® Baking Soda is derived from a natural occurring mineral called trona. It is 100% pure, safe, and natural. Baking Soda (also known as sodium bicarbonate) is a substance that is found naturally in all living things. Its purpose is to maintain pH balance in the bloodstream, which is necessary to sustain life. Due to its chemical and physical properties, sodium bicarbonate has unique medicinal capabilities that every healthcare practitioner, doctor and patient needs to know about.

The only problem is that Arm & Hammer Baking Soda can replace many more expensive medicines and this does not make the medical industrial complex happy.

In today's modern world of medicine the FDA just will not let companies that sell products make medical claims about them unless they have been tested at great expense and approved as a drug. But this was not always the case and as we can see in the information in this chapter, which is from a 1924 booklet,[1] published by the Arm & Hammer Soda Company. On page 12 the company starts off saying, "The proven value of Arm & Hammer Bicarbonate of Soda as a therapeutic agent is further evinced by the following evidence of a prominent physician named Dr. Volney S. Cheney, in a letter to the Church & Dwight Company:

"In 1918 and 1919 while fighting the 'Flu' with the U. S. Public Health Service it was brought to my attention that rarely any one who had been thoroughly alkalinized with

bicarbonate of soda contracted the disease, and those who did contract it, if alkalinized early, would invariably have mild attacks. I have since that time treated all cases of 'Cold,' Influenza and LaGripe by first giving generous doses of Bicarbonate of Soda, and in many, many instances within 36 hours the symptoms would have entirely abated. Further, within my own household, before Woman's Clubs and Parent-Teachers' Associations, I have advocated the use of Bicarbonate of Soda as a preventive for "Colds," with the result that now many reports are coming in stating that those who took "Soda" were not affected, while nearly every one around them had the "Flu."

Recommended dosages from the Arm and Hammer Company for colds and influenza back in 1925 were:
During the first day take six doses of half teaspoonful of Arm & Hammer Bicarbonate of Soda in glass of cool water, at about two hour intervals.

During the second day take four doses of half teaspoonful of Arm and Hammer Bicarbonate of Soda in glass of cool water, at the same intervals.

During the third day take two doses of half teaspoonful of Arm and Hammer Bicarbonate of Soda in glass of cool water morning and evening, and thereafter half teaspoonful in glass of cool water each morning until cold is cured.

"Well the sodium bicarbonate cure for colds and sore throats.
A friend called as I was reading about it, I told her to try it.
She is rapt! Relief in a few hours, and she went to work the
following day! And she was miserable and could hardly talk,[2]
had just woken with it full on, and was planning on missing work."

In order to secure the best results with Arm & Hammer Pure Bicarbonate of Soda (Baking Soda) when taken internally, certain simple rules must be observed. Materia Medica, pharmacology and Therapeutics (Bastedo, Page 88) clearly outlines these rules to follows:

"The effect of an alkali in the stomach will vary according to the nature of the stomach contents at the time of administration. In the resting period (after food is digested) sodium bicarbonate merely dissolves mucus and is absorbed as bicarbonate into the blood, to increase its alkalinity directly.

"In the digestive period it reduces the secretion of gastric juice, neutralizes a portion of the hydrochloric acid, liberates the carminative carbon dioxide gas, and is absorbed as sodium chloride.

"In cases of fermentation or 'sour stomach' it may neutralize the organic acids and so result in the opening of a spasmodically closed pylorus (the opening between the

stomach and the small intestine); while at the same time it acts to overcome flatulency (accumulation of gas in the stomach and bowels).

“The time of administration must, therefore, be chosen with a definite purpose. Usually for hyperchlohydria (excess of acid) one hour or two hours after meals will be the period of harmful excess of acid.

“In continuous hyperacidity and in fermentative conditions a dose an hour before meals will tend to prepare the stomach for the next meal; or sometimes a dose will be necessary immediately after eating, because of abnormal acid or base having been present at the commencement of the meal. (For the average person one-half hour after meals is recommended).

“A dose at bedtime tends to check the early morning acidity, or a dose on arising cleans the stomach of acid and mucus before breakfast.”

Whenever taking a bicarbonate solution internally the soda should be dissolved on cold water.

This is all very valuable information coming from the horses own mouth, the Arm and Hammer Baking Soda Company, which sells aluminum free baking soda. Clearly they knew what they had in their hands one hundred years ago; and its long use in medicine sustains the companies published medical views:

“Besides doing good in respiratory affections, bicarbonate of soda is of inestimable value in the treatment of Alimentary Intoxication, Pyelitis (inflammation of the pelvis of the kidney), Hyper-Acidity of Urine, Uric Acid disturbances, Rheumatism and Burns. An occasional three-day course of Bicarbonate of Soda increases the alkalinity of the blood, assists elimination and increases the resisting power of the body to all Infectious Diseases.”

Magnesium chloride is the only form of magnesium that has been reported to increase immune system strength though all forms of magnesium need to be counted in this regard. When one adds magnesium chloride to ones baths, puts it on the skin like suntan screen, or takes it orally with sodium bicarbonate one supercharges their defensive perimeter or what is called the anti-pathogen factor in Chinese Medicine. Add Iodine, Selenium, Vitamin C and some healthy sun exposure or Vitamin D and we have the heart of army we need to array against viral invaders. Magnesium Bicarbonate – Ultimate Mitochondrial Cocktail is the name of one of my chapters that explains why both these essential mineral ions need to be present in sufficient concentrations.

Testimonials:
My father was a veterinarian and as far back as I can remember (I was born in 1938 so my memory goes back to maybe 1943) he would take sodium bicarbonate dissolved in

a full glass of warm water whenever he felt a cold coming on. I don't remember him ever coming down with a full blown cold. He would treat my cold symptoms likewise and I responded equally as well. He also treated farm animals for various illnesses with sodium bicarbonate via a gastric tube and they recovered quickly. So I've known about the benefits of sodium bicarbonate from early childhood on. Glad to see that its benefits are being more widely touted. Although my father was a doctor of Veterinarian medicine, he sometimes referred to himself as an MD (Mule Doctor).

Dr. David B Winter, DO

Dear Dr. Sircus,

Several weeks ago, I purchased your eBook about Sodium Bicarbonate. IT CHANGED MY LIFE. I believe that God is working through you and your staff to spread the word about the body's natural ability to heal, given the right elements. Thank you!!!

I've been reading your newsletter for some time now, and happened to see your eBook about baking soda. We don't have a lot of money, but I felt that your research might help me. Sure enough I can tell you that within the week following reading your book - and practicing what you preach – I have been practically hive/urticaria free.

I started with straight baking soda and water. Yuck! I could hardly make myself do it. But I was going for the PH balance you talked about. I read more about the different oral combinations and decided to try the Maple Syrup and Baking Soda. 3:1, it worked great and tasted great too. I couldn't believe I could eat that much sugar!

Right now I'm smiling and feeling great. My mood is good, my energy is way up and most important the swellings and itching are gone. My hair is growing back thicker. My skin looks great. I'm not tired all the time. I can't believe the difference in my health. Praise God for his goodness in inspiring your work.

I've recently added Nascent Iodine after reading some tips of yours. I was indeed deficient and that seems to be adding to the overall good effects. My children are benefiting from this research as well. I'm so happy to find alternatives to mainstream medicine.

Lane Carter,
Delaware, United States

Dear Dr. Sircus,

I have had Morgellons for over 6 years – very nasty – and I know you are aware of our plight. I am now ready to start your transdermal magnesium therapy treatments but first I have to tell you something.

I would like you to know that bicarbonate baths really help me. But, and this is a big BUT, I use it with about 3 Lb's of sea salt per bath and when I did 5 Lb's of bicarbonate – I put myself into an alkaline state. The high salt content somehow opened up my skin to take in the bicarbonate – it came out of my skin for a few weeks!

Thank you,
Carola Dunham

The addition of a cup of baking soda to a hot bath after a long exhausting day alleviates tension and muscle aches. It exfoliates the skin to remove dead dry skin leaving fresh bright youthful skin behind without the high cost of the commercial skin exfoliates. The addition of baking soda to foot baths help with tired, achy feet when working in jobs such as waitressing or other heavy-walking type jobs. Combining the baking soda with magnesium chloride brings dramatic changes to human physiology and the only thing making this formula even better would be the addition of some sodium thiosulfate for a full hot springs therapeutic treatment.

When salt and baking soda are combined in the
bath, the combination may reduce the negative
effects of minor exposure to the radiation from X-rays.

Sodium bicarbonate, the monosodium salt of carbonic acid, is used as a gastric and systemic antacid and to alkalize urine; also used, in solution, for washing the nose, mouth, and vagina, as a cleansing enema, and as a dressing for minor burns.

Knock Out The Cold & Flu With Sodium Bicarbonate

Mark Sircus Ac., OMD
http://sodiumbicarbonate.imva.info
November 27, 2009
http://www.healthtruthrevealed.com/article...3333011/article

Though we know by now that sodium bicarbonate is a most useful medicine for the treatment of cancer and kidney disease and have always known its good for stomach acid imbalances and for cleaning our pools and refrigerators it is not likely we have

thought about it to help resolve our common colds nor to alleviate they symptoms and dangers of influenza. Medicine does not have to be complicated and mysterious nor do we have to lay still and be run over by the Hun Hordes of Influenza viruses that the health authorities want us to be so frightened of.

Dr. Volney S. Cheney reported[1] long ago that, “A number of cases of colds of varying severity were carefully studied in the laboratory. Observation was made as to the degree of acidity of the urine; the CO2, combining power of the blood as an indicator of the alkaline reserve; tests were also made to determine the calcium content of the blood, the sugar content; non-protein nitrogen and the basal metabolism. The urine invariably carried a higher degree of acidity than the normal-in some cases as high as 800 (normal 350); the CO2 combining power of the blood in all cases was low, the highest being 52 per cent; the sugar content of the blood was generally decreased (below 100 mg. per 100 c.c.); the metabolic rate was always on the minus side. (These cases were carefully selected because of their lack of any symptoms of disturbed thyroid activity.) There is a change in the blood chemistry and, consequently, there must be a change in the tissues supplied by the blood. There is a decrease in the bicarbonates or reserve bases contained in the blood plasma and the tissues. These findings seem to point the way to the conclusion that a cold is a disturbance of the alkaline balance or reserve, in other words, a mild acidosis, or perhaps better stated, a lessening of the “buffer” action of the blood plasma through a decrease in its bicarbonate content.”

After doing his experiments, Dr. Cheney reported: “I have been able to induce all the symptoms of a cold, in varying degree from a simple coryza to that of la grippe and the “flu,” by the induction of an artificial acidosis through the administration of ammonium and calcium chlorides. The degree of severity of the symptoms was in direct ratio to the degree of acidosis induced. In the severer degree of acidosis, all the classical symptoms of the “flu” were present, even including a low degree of fever. The symptoms rapidly subsided upon the administration of sodium bicarbonate in large doses by mouth and by rectum.

Let’s talk about your refrigerator. Go home, unplug your refrigerator, and find out what happens. Now remember that before you unplugged that fridge there was no mold, no bad bacteria, and no bugs. By pulling the plug you change the environment. Watch what happens. Your food will start to break down through fermentation and then putrefaction. Things start growing and crawling around. Where did they come from? You know that they didn’t sneak in. The door was closed. They were always there. It is just that they have gone through metamorphosis and they have changed due to an environmental shift – in other words “a drop in pH”.

Dr. Cheney further reported his “abortive treatment” of any cold or flu thusly:

If the disease is attacked when there is a beginning dryness in the pharynx or a slight

corzya, or congestion of the mucous membrane of the nose, and alkalinization is instituted by large doses of sodium bicarbonate, until the urine is alkaline to litmus paper, a “cold” can always be aborted. Along with the sodium bicarbonate which I generally prescribe in 6 g. doses, accompanied by a large glass of hot water, every 2 hours for 3 doses, I give to an adult 1 g. of calcidin (a calcium and iodine combination) every half hour until 6 doses have been taken.

Most colds begin to manifest themselves late in the afternoon or early evening and the abortive treatment is best given at this time up to retiring. At the time of taking the treatment, the usual meal should be dispensed with, or should consist of milk and some cereal, or soup or broth. If the bowels are constipated, they should not be moved by a cathartic or laxative but the lower bowels should be relieved by a soap suds enema. This treatment will abort colds, if taken in their incipiency.

Where a cold has advanced to the stage where there is hoarseness and a profuse coryza, or where this condition has advanced to what we generally term “a cold,” I use the following treatment:

Initial dose 6 g. of sodium bicarbonate and 1 g. of calcidin, then 3 g. of sodium bicarbonate and 1 g. of calcidin every 2 hours for 6 doses, then 20 g. of sodium bicarbonate with /3 g. of calcidin every 3 hours during the waking period until the cold is checked.

The administration of the sodium bicarbonate should always be in or followed by a large glass of hot water. Locally, spray the nose and throat with a 1 to 5000 solution of metaphen, or other alkaline solution (1 dram of sodium bicarbonate to one pint of water) morning and night. If the bowels are constipated, I prescribe no laxative or cathartic but use an enema of soap suds to relieve the lower bowels.

Prophylaxis is best maintained by exercise and a diet which is well balanced and thoroughly adapted to the individual’s physical activities.

When the cold or ‘flu germs enter your body they immediately lodge themselves in the membranes of your nose. Your immune system then resists them by releasing inflammatory mediators. These in turn cause excessive mucus gland secretion, which blocks the sinuses, leading to a runny nose and all the other unpleasant symptoms of a cold or the ‘flu.

Dr. Hana’s Nasopure® Nasal Wash System transforms the ancient technique of nasal irrigation into the most effective, convenient and inexpensive nose washing system available today. It is a modern day netti pot. It quickly and safely washes away pollen, mold, dust, bacteria, viruses and mucus— the primary causes of nasal and sinus allergies, infection and discomfort. The Nasopure sinus cleansing salt mixture contains

pharmaceutical grade sodium chloride (salt) and sodium bicarbonate.

Do not add regular table salt to any solution used for nasal washing as it contains undesirable additives and throws off the saline concentration of the solution. Salt is both soothing and therapeutic (in the proper concentration). Too little or too much salt will cause the water to “burn” or irritate your nasal passages and sinuses. Pickling salt, which is usually pure salt, is preferable to regular table salt if making your own salt solution.[2]

For a 0.9% isotonic saline solution, the amount normally found in bodily fluids, use 1/3 teaspoon (approx. ¼ heaping teaspoon, or 1.85 ml) of salt. Anything less than this is hypotonic, anything greater is hypertonic. Some research suggests a hypertonic solution may be best when combating a runny nose (as it would have a drying effect), so you might want to go to the higher end of the salt range. Add baking soda (sodium bicarbonate) to help buffer the solution. A hypotonic solution, however, would tend to be moisturizing (i.e. the lower end of the salt range), and may be what you want in a nasal spray for general prophylactic use.

If you want to take direct action against the virus or germs that are already attacking you, the battleground is inside your nose. Directions for common use of nasal washings include; pour a little warm water into a dish and add a level teaspoon of your sodium bicarbonate. Stir it well and then immerse your nose and surrounding parts of your face into it. Slowly breathe the water up your nose until it reaches the point where it begins to overflow into your mouth. Then expel it and rinse your mouth out. Be careful not to add more than a teaspoonful to the water, and that the dish is of a size that enables you to fit your face into. If the mixture is too strong it will sting your nose for a while. A little trial and error will tell you how warm the water should be, which is warm enough but not hot. Do this three times a day, and it should ward off even the heaviest of colds well ahead of time.

Garlic nose drops. In his book The Healing Power of Garlic Paul Bergner writes: “Garlic nose drops directly kill the viruses that cause cold or flu.” He also writes about a study with mice where some were inoculated with garlic, and some were not. The flu virus was introduced to the nasal passages of each mouse. Those mice that received the garlic remained healthy, where all the others got sick. To make nose drops, Bergner instructs us to crush some garlic to obtain juice, and add ten parts water and mix well. Eating garlic will also have a systemic effect, but deodorized garlic tablets or capsules reportedly do not work near as well.

Hydrogen Peroxide: Another method is to fill a spray bottle with a 50/50 mixture of hydrogen peroxide and water. Tilt your head back and spray it into your nostrils. It will bubble up and help to kill the bacteria in your nose. Hold for a few minutes and then blow your nose into a tissue. One can also use hydrogen peroxide in a vaporizer as well.

If an individual co-operates in a cleansing process of Nature by performing enemas, nasal washes and gives rest to his digestive system by observing a modified fast at the very beginning of cold or flu they will reduce the severity and length of their suffering and with a little luck get rid of the problem within 48 hours. During a fast, half lemon juice mixed with a glass of warm water may be taken several times a day. One or two spoons of honey may be added to this if desired. Not only does this help with the elimination process but it directs internal energies to healing instead of digesting and assimilating new food.

Zinc gluconate lozenges reduced the average
duration of common colds with exceptionally strong
statistical significance when taken in the first few hours.

Because most people don't understand what detoxification symptoms are, they head to a drug-oriented doctor, who also doesn't understand detoxification symptoms. The doctor confirms that they are sick, and then puts them on some sort of drug that is designed to stop the symptoms and this short circuits the detox dump and actually prolongs suffering. A real doctor will look at what is really going on and treat the problem on a fundamental level with medicinals that do not interfere with the natural process going on. According to recent studies use of over-the-counter cold and flu medicines at any stage of the illness only act to make it worse by prolonging the disease [3] and drugs like Tamiflu have their own dangerous toxicity that in certain cases is life threatening.

[2] Note: "Neti pot salt" (or "aromatic salt") is just a marketing gimmick to sell salt at a higher price. It usually has some essential oils added, which might have some therapeutic value, or which some people may find pleasing. However it should be viewed as a luxury at a premium price, with relatively little practical value. Use it if you wish, but pickling salt is usually just as pure and free of additives, is widely available, and generally inexpensive.

Title: Swine Flu Susceptibility Linked to Arsenic Exposur
Description: *[AS IVE SAID BEFORE ITS POLLUTIONS!]*

craig-oxley - December 4, 2009 02:19 PM (GMT)

*How many times have I been pushing **William Beaumont**? Its your body environment which beings about bacteria, virus and fungi. You cannot get these problems if the body is clean of filth and looked after. This also aids the information Jon Rappoport is trying to get out to the sheep. By the way Roman Catholic, Louis Pasteur was a fraud. -Craig*

Swine Flu Susceptibility Linked to Arsenic Exposure

Josh Hamilton, Ph.D.,
Marine Biological Laboratory and Dartmouth Medical School
NIEHS Grant P42ES007373
http://www.niehs.nih.gov/research/supporte...09/swineflu.cfm

Low-level exposure to arsenic at concentrations found commonly in US drinking water compromises the initial immune response to H1N1 or swine flu infection according to NIEHS-supported scientists. The study, conducted in laboratory mice, suggests that people exposed to arsenic in their drinking water may be at increased risk for more serious illness or death in response to infection from the virus.

Laboratory mice were exposed to arsenic at a concentration of 100 parts per billion in their drinking water. The mice initially showed a weak immune response to the virus, and when the immune response fully developed, it was “too robust and too late” according to the study’s senior author, Josh Hamilton. The late influx of immune cells to the lung and the inflammatory response caused lung damage and bleeding not seen in the control animals. Over the course of the infection, the death rate in arsenic exposed animals was much higher than the non-exposed mice.

The current US EPA drinking water standard is 10 parts per billion; however, 100 parts per billion levels are commonly found in well water in areas where arsenic is

geologically abundant such as New England, Florida, large portions of the Midwest, the Southwest, and the Rocky Mountains. The study authors also point out that high levels of arsenic in drinking water are common in the areas of Mexico where swine flu was initially reported.

View Full Version: FLU CAUSES SURGE OF *GARLIC* SALES IN SERBIA

Title: FLU CAUSES SURGE OF *GARLIC* SALES IN SERBIA

craig-oxley - November 14, 2009 02:05 PM (GMT)

flu causes surge of garlic sales in Serbia

By DUSAN STOJANOVIC (AP)
13 Nov 2009

BELGRADE, Serbia — Belgrade's open-air markets were a welter of busy customers on Friday, pushing and shoving to buy one item — garlic.

In Serbia, garlic has long been regarded as a good luck charm and a guard against many ailments. As far as the public is concerned, that includes the swine flu pandemic, which recently has spread in Serbia and triggered near panic among the local population.

That is now evident in Belgrade's produce markets, where the price of garlic has shot up, thanks to a sudden increase in demand. The smell of the little white cloves also has become prevalent in public places as people munch on them as if eating apples.

Health officials have publicly urged the population not to take garlic's healing properties so seriously. Instead, they recommend opting for more conventional precautions, such as washing hands, wearing face masks, or eventually getting vaccinated.

But those calls seem to have been in vain.

"Garlic is the best, forget the vaccines," said Marko Jankovic, an elderly Belgrader, with the pungent smell of garlic obvious as he spoke at the crowded Kaleniceva Pijaca market. "From the vaccine, you can get sick. From garlic, you can only get bad breath."

Facing a surge of swine flu cases, Serbia's Health Ministry on Friday ordered 3 million vaccines from Swiss pharmaceutical company Novartis AG.

The authorities said Serbia has about 270 proven swine flu cases and eight deaths — up from about 130 cases and two deaths at the beginning of November.

In many parts of the world, the distinct taste and smell of garlic are considered essential in many meals. But in Serbia — as elsewhere in the Balkans — many people consider it more important than that.

Garlic is kept on doorsteps or in pockets to keep vampires away, and under babies' pillows to ensure a healthy and prosperous life. Serbs often consume garlic as a snack together with slivovitz, a strong plum brandy.

These days, Serbian media often compare what happened at two popular music festivals as proof of the alleged medicinal virtues of garlic.

That's because Serbia's first swine flu cases were confirmed after the annual Exit rock music festival in July in the town of Novi Sad, where authorities say the mostly young audience indulged in beer and marijuana.

By contrast, the media say, no swine flu cases resulted from the equally popular folk music festival in Guca, central Serbia, where the generally older, more tradition audience gorged on meat dishes heavily spiced with garlic, and drank slivovitz.

For centuries, garlic has been regarded by many people around the world as a successful medical treatment for everything from indigestion to respiratory problems. Recent medical studies also have shown that garlic can reduce a person's blood pressure.

But in Serbia, doctors are telling the public to stop considering it as a swine flu defense.

"People must take this pandemic more seriously and focus on real prevention and medicine," not garlic, said Zoran Djordjevic, a virology doctor at a Belgrade hospital.
****

My mother remembers her mother looping garlands of garlic around the house and the necks of her sisters and brothers during the 1918 pandemic. Mother was only about 3--4 years old, so it must have made quite an impression.

View Full Version: Anticoagulant herbs to fight H1N1 pulmonary emboli

Title: Anticoagulant herbs to fight H1N1 pulmonary emboli

craig-oxley - October 16, 2009 09:11 AM (GMT)

Herbs with anticoagulant properties are listed on the left; on the right is the effect of each herb.

Alfalfa = Coumarin (acts as an anticoagulant)
Angelica = Coumarin
Aniseed = Coumarin
Arnica = Coumarin
Asafoetida = Coumarin, anticoagulant in vivo
Bogbean = Hemolytic activity
Cassla = Inhibits platelet aggregation
Celery, seed or extract = Coumarin
Chamomile, German or Roman = Coumarin
Clove = Eugenol, a powerful inhibitor of platelet activity
Dehydroepiandrosterone (DHEA) = Fibrinolytic potential
Evening primrose oil (Primula veris, Primula clatior) = May decrease platelet aggregation and increase thrombolytic activity
Feverfew = Inhibits platelet aggregation in vitro
Fucus = Anticoagulant action
Garlic = May prolong prothrombin time
Ginger = Inhibition of platelet activity
Ginkgo = Inhibits platelet aggregation
Ginseng, Panax = Reduction of blood coagulation/decreases INR
Horse chestnut = Coumarin
Horseradish = Peroxidase stimulates synthesis of arachidonic acid metabolites
Licorice = Inhibition of platelet activity
Meadowsweet = Salicylate (acts as an antiplatelet agent)
Melilot = Coumarin
Poplar = Salicylate
Prickly ash, Northern and Southern = Coumarin

Quassia = Coumarin
Red clover = Coumarin
Sweet woodruff = Coumarin
Tonka beans = Coumarin
Willow = Salicylate

ANTI-COAGULANTS. Herbs that keep the blood 'flowing' by preventing clotting or clumping of the placelets. Anti-coagulants are justified after myocardial infarction, may prevent cardiac death, and are not outweighed by adverse reactions. If vakue in thrombosis.

Bayberry, Cowslip root (Biostrath), **Garlic**, Ginseng, Lime flowers.

craig-oxley - October 16, 2009 09:30 AM (GMT)

Folks please don't forget the wonderful Cayenne Pepper & Tumeric for this purpose also.

craig-oxley - October 18, 2009 10:14 AM (GMT)

How could I have forgotten to tell you one of the greatest anticoagulants? Yes well guess what it is? Its the amazing raw Onion. Eat at least half a raw cooking onion a day or much more in times of trouble. This will go well with raw garlic cloves for serious medicinal potency.

Canada Issues Alert on Severe Respiratory Disease in Mexico

Recombinomics Commentary 02:22
April 23, 2009

The Public Health Agency of Canada has told quarantine services to be on alert for travellers returning from Mexico after a number of severe respiratory illnesses (SRI) were reported in some regions of the country.

PHAC, in an April 20 report, said Mexican officials informed the Canadian health agency that the "case-fatality rate was relatively high" and that most cases involved healthy adults between the ages of 25 and 44. A number of health-care workers were also affected.

Although no cause has been confirmed, some samples were positive for influenza A and B.

The above comments on an alert issued by Canada offer some insight into the situation in Mexico. The reports out of Mexico are decidedly mixed. Some reports describe an increase in influenza cases which is attributed to a late spike in influenza B, which when combined with influenza A, gives an abnormally high number of cases this late in the season. Other reports discuss revaccinating at risk groups with the current trivalent vaccine.

Samples have been sent to Canada for a comprehensive analysis.

The increased influenza-like illness and fatalities was announced as the CDC issued an

MMWR dispatch on H1N1 swine flu. Two cases have been confirmed in children (9F and 10M) and family members had mild symptoms but were not tested. The precise location of the clusters in southern California has not been released, but one cluster is in San Diego Country, while the other is 100 miles away in Imperial County (see updated map). Additional suspect cases in Imperial County have been noted and it is likely that these cases are near the border with Mexico. Some media reports also note that some contacts have not been interviewed because they were in Mexico.

It remains unclear if these two outbreaks are related. All reported cases in California have been mild, and the two confirmed cases were influenza A positive, but failed to sub-type for seasonal flu. It is unclear if sub-typing failures have led to the confusing reports out of Mexico.

craig-oxley - April 23, 2009 11:09 PM (GMT)

23/Apr/09
http://www.elsemanario.com.mx/news/news_di...?story_id=19072

MEXICO CITY .- The Ministry of Health yesterday began a siege of health hospitals in the Federal District before the alert for cases of influenza.

The outbreak of respiratory disease, which claimed 13 lives in the capital, changed part of the routine of the hospital, the staff began to be vaccinated, was suspended access to pregnant women, were canceled the medical students for 15 days, restricted visits and a few family members who entered were given masks.

craig-oxley - April 23, 2009 11:10 PM (GMT)

North Bay Parry Sound District Health Unit

News Release

****

The North Bay Parry Sound District Health Unit advises that a number of severe respiratory illness (SRI) cases are occurring in various locations of south and central Mexico. At this time, no cases have been reported outside of Mexico. Physicians and local healthcare workers are asked to actively watch for cases of SRI, especially in people who have returned from Mexico within the last two weeks.

The people in Mexico who have SRI began with influenza-like symptoms that rapidly progressed to severe respiratory distress in about 5 days, with many

requiring mechanical ventilation. Some patients have died. Most people who became ill were previously healthy young adults aged between 25-44 years old. Some health care workers have also been affected.

The Health Unit notified physicians, hospitals, and walk-in clinics within the North Bay Parry Sound catchment area. If you have visited Mexico in the last two weeks and have influenza-like symptoms (eg: fever, cough, sore throat, muscle or joint aches, shortness of breath) seek medical attention.

To stay healthy and prevent the spread of infections, the Health Unit recommends:

• Wash your hands well and often.
• Sneeze and cough into your upper sleeve.
• Stay at home when you are ill.
• Eat a well-balanced diet.

The Health Unit will provide more information as it becomes available.

craig-oxley - April 23, 2009 11:11 PM (GMT)

Canada on alert after respiratory illnesses reported in Mexico

Canwest News ServiceApril 22, 2009
http://www.calgaryherald.com/Health/Canada...3180/story.html

OTTAWA — The Public Health Agency of Canada has told quarantine services to be on alert for travellers returning from Mexico after a number of severe respiratory illnesses (SRI) were reported in some regions of the country.

Mexican health authorities contacted PHAC last Friday to inform them of the respiratory conditions, which were reported in the south and central areas of Mexico. The cases elevated from flu-like symptoms to severe respiratory conditions in about five days, with "a high proportion" of cases requiring assisted ventilation.

PHAC, in an April 20 report, said Mexican officials informed the Canadian health agency that the "case-fatality rate was relatively high" and that most cases involved healthy adults between the ages of 25 and 44. A number of health-care workers were also affected.

Although no cause has been confirmed, some samples were positive for influenza A and B.

PHAC said the concern for Canadians travelling from Mexico serves as a "reminder of the importance of the SRI hospital-based surveillance established after the SARS

outbreak in Canada."

500 cases reported in Mexico City

Thursday, April 23, 2009

The contagion has affected workers and employees of major public hospitals in the Capital, such as the Juarez Hospital, General Hospital, National Institute of Respiratory Diseases, and hospitals in the area of Tlalpan

MEXICO CITY .- **At least 500 employees of the Health sector in Mexico City are infected with influenza virus, reported Antonio Sanchez Arriaga, general secretary of the National Independent Union of Health Workers.**

The contagion has affected workers and employees of major public hospitals in the Capital, such as the Juarez Hospital, General Hospital, National Institute of Respiratory Diseases, and hospitals in the area of Tlalpan, where the National Institute Cardiology, the National Nutrition Institute and the Hospital Manuel Gea González, in addition to the Red Cross Polanco.

The union leader warned that the number of infections could triple this week not to take necessary health measures

"Last Friday we learned of the infection and ask our representatives in the various hospitals who send us reports of patients, and found that the focus of infection and reached 500 partners," said Sanchez Arriaga.

The leader of the guild said that the authorities are overcome by the presence of influenza in hospitals and only palliative measures have been implemented to try to prevent further infections.

"Right now we are being vaccinated and are taking a week leave to employees who are sick, but this is already an epidemic, and again we believe that if this continues this week we could have more than 500 thousand infected," he said.

Sanchez Arriaga explained that it is essential to vaccinate personnel working in the areas of neonatology, pediatrics, gynecology and pulmonology, and who have the most potential for spreading infection in high risk populations.

New Strain of Swine Flu Investigated

Two Children in San Diego Area Had No Contact With Pigs

By David Brown
Washington Post Staff Writer
Wednesday, April 22, 2009
http://www.washingtonpost.com/wp-dyn/conte...9042103694.html

Public health authorities are investigating two highly unusual cases of a previously unknown strain of swine flu that was found in the San Diego area late last month.

The cases occurred almost simultaneously in children who had no contact with pigs or each other, **a scenario that raised the possibility that the illnesses may be the sign of an emerging pandemic strain of influenza.**

More than 50 scientists and epidemiologists at the Centers for Disease Control and Prevention in Atlanta are studying the strain, and dozens of public health investigators in Southern California are looking for more cases among the those who had contact with the children.

"While we have a low index of suspicion that this is a pandemic, we're being very careful in our investigation to rule out every possibility," said Lyn Finelli, an epidemiologist in the CDC's influenza division.

Neither of the children -- a 10-year-old boy in San Diego County and a 9-year-old girl in Imperial County, just to the east -- was seriously ill. The cases were detected because both children were treated at clinics that took nose or throat swabs looking for influenza and passed the samples on to health department labs when they could not identify the strains.

"It was a very fortunate lightning strike," Finelli said yesterday.

Both children have recovered. The boy, however, took an airplane trip to Texas with his younger brother while at the tail end of his illness before it was known that he had an unusual strain of flu. Health officials in the Dallas area are looking for cases there, as well as among airline employees who assisted the two children, who traveled as "unaccompanied minors."

Public health officials in the two California counties -- both of which border Mexico -- are urging physicians and hospitals to look carefully for cases of flu and report any to local health departments.

Flu season, which officially ended this month, was mild this year. However, Stephen

Munday, the health officer for Imperial County, said his jurisdiction saw cases late in March, although not enough to qualify as an outbreak. Whether any other cases involved swine flu is unknown at this point.

The Imperial County girl fell ill on March 28 with cough and a high fever, and the San Diego boy came down with similar symptoms, as well as vomiting, two days later. People in both households became sick before and after the children did, although health officials have not determined whether they also had swine flu.

Munday said his department has drawn blood from more than 20 people to be tested for antibodies to the swine flu strain. The antibodies would be a sign that those people were infected even if they never had symptoms. He said some had traveled into Mexico recently but would not describe them further.

"As of yet, we have not been able to come up with any explanation of why anyone would have swine flu," he said.

Molecular analysis of the virus suggests that it is the product of a rare event called a "gene reassortment." In a reassortment, two distinct strains of virus infect the same cell. The viruses take over the cell's genetic machinery to make copies of themselves, mingling the genes of the two strains to create a new, essentially hybrid, strain. Six of the eight genes in the new strain are from the North American lineage of swine flu, but two are from the Eurasian lineage.

The reassortment probably occurred in a pig sometime in the past decade. Both sets of genes are slightly different from those of their original lineage -- a sign that time has passed. However, it is unlikely that they have been in humans very long.

"If these viruses had been circulating at low levels in humans for several years, we probably would have detected them," said Nancy J. Cox, head of the CDC's influenza division.

The ability to find and identify rare strains of influenza virus has improved greatly in the past decade, spurred in part by the "bird flu" outbreak in Asia and the anthrax attacks of 2001.

In the past three years, the CDC has investigated 12 cases of human illness caused by swine flu strains. In 11 of the cases, however, the infected people had direct or indirect exposure to pigs.

In 1976, a strain of swine flu caused illness in 13 soldiers at Fort Dix in New Jersey, killing one.

Fearing a pandemic might be in the offing, the federal government ordered emergency production of a vaccine and made plans to administer it to millions of elderly and

vulnerable Americans. Mass immunization was halted, however, when the virus did not spread and some vaccine recipients developed a rare neurological disorder called Guillain-Barre syndrome.

Swine flu cases up to 7; officials expand probe

By MIKE STOBBE – 18 minutes ago
http://www.google.com/hostednews/ap/articl...zMM_EQD97OFAI80

ATLANTA (AP) — Health officials are investigating a never-before-seen form of the flu that combines pig, bird and human viruses and which has infected seven people in California and Texas. All the victims recovered, but the cases are a growing medical mystery because it's unclear how they caught the virus.

None of the seven people were in contact with pigs, which is how people usually catch swine flu. And only a few were in contact with each other, according to the U.S. Centers for Disease Control and Prevention.

Still, health officials said it's not a cause for public alarm: The five in California and two in Texas have all recovered, and testing indicates some mainstream antiviral medications seem to work against the virus.

Dr. Anne Schuchat of the CDC said officials believe it can spread human-to-human, which is unusual for a swine flu virus.

The CDC is checking people who have been in contact with the seven confirmed cases, who all became ill between late March and mid-April.

Because of intensive searching, it's likely health officials will find additional cases, said Schuchat, director of the CDC's National Center for Immunization and Respiratory Diseases.

CDC officials detected a virus with a unique combination of gene segments that have not been seen in people or pigs before. The bug contains human virus, avian virus from North America and pig viruses from North America, Europe and Asia.

Health officials have seen mixes of bird, pig and human virus before, but never such an intercontinental combination with more than one pig virus in the mix.

Scientists keep a close eye on flu viruses that emerge from pigs. The animals are considered particularly susceptible to both avian and human viruses and a likely place where the kind of genetic reassortment can take place that might lead to a new form of pandemic flu, said Dr. John Treanor, an infectious disease specialist at the University of

Rochester Medical Center.

The virus may be something completely new, or it may have been around for a while but was only detected now because of improved lab testing and disease surveillance, CDC officials said.

The virus was first detected in two children in southern California — a 10-year-old boy in San Diego County and a 9-year-old girl in neighboring Imperial County.

The cases were detected under unusual circumstances. One was seen at a Navy clinic that participates in a specialized disease detection network, and the other was caught through a specialized surveillance system set up in border communities, CDC officials said.

On Thursday, investigators said they had discovered five more cases. That includes a father and his teenage daughter in San Diego County, a 41-year-old woman in Imperial County (the only person hospitalized), and two 16-year-old boys who are friends and live in Guadalupe County, Texas, near San Antonio.

The Texas cases are especially puzzling. One of the California cases — the 10-year-old boy — traveled to Texas early this month, but that was to Dallas, about 270 miles northeast of San Antonio. He did not travel to the San Antonio area, Schuchat said.

The two 16-year-olds had not traveled recently, Texas health officials said.

The swine flu's symptoms are like those of the regular flu, mostly involving fever, cough and sore throat, though some of the seven also experienced vomiting and diarrhea.

CDC are not calling it an outbreak, a term that suggests ongoing illnesses. It's not known if anyone is getting sick from the virus right now, CDC officials said.

It's also not known if the seasonal flu vaccine that Americans got last fall and early this year protects against this type of virus. People should wash their hands and take other customary precautions, CDC officials said.

U.S. health officials are consulting with Mexican and Canadian health officials, and the CDC is beginning to receive samples from Mexico for testing, a CDC spokesman said. The ethnicity of the seven confirmed cases was not disclosed.

CDC confirms 7 cases of swine flu in humans

23 APR 2009
By Elizabeth Landau

http://www.cnn.com/2009/HEALTH/04/23/swine...ref=mpstoryview

(CNN) -- A total of seven cases of a previously undetected strain of swine flu have been confirmed in humans in the United States, the Centers for Disease Control and Prevention said. None of the patients has had direct contact with pigs.

Five of the cases have been found in California, and two have been found in Texas, near San Antonio, said Dr. Anne Schuchat, the CDC's Interim Deputy Director for Science and Public Health Program.

The CDC reported Tuesday that two children in the San Diego, California, area, infected with a virus called swine influenza A H1N1, whose combination of genes has not been seen in flu viruses in either human or pigs before.

The patients range from age 9 to 54, Schuchat said. They include two 16-year-old boys who attend the same Texas school, and a father and daughter in California.

"The good news is that all seven of these patients have recovered," Schuchat said.

The first two cases were picked up through a special influenza monitoring program, with stations in San Diego and El Paso, Texas. The program aims to get a better sense of what strains exist and to detect new strains before they become widespread, the CDC said. Other cases emerged through routine and expanded surveillance.

At this point, the ability for the human influenza vaccine to protect against this new swine flu strain is unknown, and studies are ongoing, she said.

There is no danger from contracting the virus from eating pork products, Schuchat said.

The new virus has genes from North American swine and avian influenza, human influenza and swine influenza normally found in Asia and Europe, said Nancy Cox, chief of the CDC's Influenza Division.

Swine flu is a respiratory disease of pigs caused by type A influenza, according to the CDC. It does not normally inflect humans, but cases have occurred among people, especially those who have had direct exposure to pigs. There have also been cases in the past of one person spreading swine flu to other people, the CDC said.

In 1988, in an apparent swine flu infection in pigs in Wisconsin, there was antibody evidence of virus transmission from the patient to health care workers who had contact with the patient, the CDC said.

Person-to-person transmission is believed to occur in a manner similar to the spread of the influenza virus: through infected people coughing and sneezing, the CDC said.

People may contract swine flu by touching something with viruses on it and then touching their mouth or nose.

From December 2005 to February 2009, 12 cases of human infection with swine flu were documented.

Symptoms of swine flu in humans are expected to resemble regular human seasonal influenza symptoms, including fever, lethargy, lack of appetite, and coughing, the CDC said. Other reported symptoms include runny nose, sore throat, nausea, vomiting and diarrhea.

The new strain of swine flu has been resistant to the antiviral drugs amantadine and rimantadine, but has responded to the other licensed options: oseltamivir and zanamivir.

The CDC is working closely with health officials in California and Texas to learn more about the virus. The agency expects to find more cases, Schuchat said.

If swine flu can mutate to spread between humans, what does this mean for avian flu? Because of the virus subtype, it is less likely that avian flu would become transmissible from person to person, but still possible, said Dr. William Short at the division of infectious diseases at Thomas Jefferson University Hospital in Philadelphia, Pennsylvania.

The news is not cause for widespread panic, but people at risk -- those who live in or have traveled to the areas where patients live, or have been in contact with pigs -- should watch out for symptoms and get tested if they occur, Short said.

The three criteria for a pandemic are a new virus to which everybody is susceptible, the ability to spread from person to person readily, and wide geographic spread, said Dr. Jay Steinberg, infectious disease specialist at Emory University Hospital Midtown in Atlanta, Georgia. The new strain of swine flu only meets one of these criteria: its novelty.

On the other hand, bird flu meets two of the criteria: novelty and geographic spread.

If history is any indication, flu pandemics tend to occur once every 20 years or so, meaning we're actually due for one, he said. However, it is not likely to be the swine flu, he said.

"I can say with 100 percent confidence that a pandemic of a new flu strain will spread in humans," Steinberg said. "What I can't say is when it will occur."

Swine flu cases put Nevada health officials on alert

By Mary Manning
Thu, Apr 23, 2009 (2:37 p.m.)
Beyond the Sun
http://www.lasvegassun.com/news/2009/apr/2...fficials-alert/

Nevada state health officials are on heightened alert after a federal agency confirmed seven cases of swine flu in people who appear to have had no contact with pigs.

A 10-year-old boy and a 9-year-old girl in Southern California were first diagnosed with an "unusual" strain of swine flu last week, the Centers for Disease Control and Prevention, based in Atlanta, said during a teleconference today.

Since then five other cases, including two in Texas that were confirmed this morning, have been found, officials said.

Typically, the swine flu virus was transmitted to people who had contact with pigs, but in the latest cases, no such connection to the animals has been discovered, officials said.

Although there have been no swine flu cases reported in Nevada, the state Health Division is preparing a technical bulletin for doctors around the state, Martha Framsted, spokeswoman for the health division, said.

State health investigators with epidemiologists are staying in contact with the CDC daily, said Framsted.

The technical bulletin will be posted to the state Health Division's Web site probably as soon as Friday, Framsted said.

Like typical influenza, swine flu can be prevented by washing hands thoroughly, staying home if coughing, sneezing or diarrhea is occurring and by receiving a flu vaccine annually, Framsted said.

Four different segments of influenza strains have been found in the cases of swine flu discovered so far, including the North American, the North American avian, human and swine strains from Asia and Europe, CDC officials said.

These swine flu strains combined have not been seen before in any laboratory.

A total of five swine flu cases have been confirmed in California from San Diego County and the Imperial Valley, CDC officials said. A father and his daughter contracted the flu there.

In Texas two 16-year-old boys, classmates in San Antonio, were diagnosed with the same strain.

Ages of the people who have had this swine flu range from 9 years of age to 54, CDC said. It is unknown how the virus is spreading, as a 10-year-old boy traveled from California to Dallas, but none of that particular flu strain has been found in Dallas, CDC said.

All of the cases have recovered. One was hospitalized, but has since recovered.

As the typical influenza season winds down, CDC officials said, it is unusual for swine flu to arise.

craig-oxley - April 23, 2009 11:33 PM (GMT)

New Flu Strain Alarms Health Authorities To Possibility of Pandemic

By Christopher HIllenbrand
April 22nd, 2009 13:15 EST
http://thesop.org/index.php?article=15955

According to officials for the U.S. Centers for Disease Control, two children in California were diagnosed with a new form of the swine flu last week. And though the two children were quickly treated and both have recovered, officials are on the lookout for any more cases to arise.

The strain in question belongs to the subtype of the influenza virus known as H1N1, the same subtype responsible for the seasonal infection currently affecting some in the country. But as representatives for the C.D.C. and Prevention briefed, the new strain found in California genetically resembles a type of the virus discovered in pigs and not those infecting humans.

Health officials believe it isn`t beyond the realm of possibility that the children contracted the disease from other people and not by pigs as the strain may indicate. They said that they conferred with authorities in Canada, Mexico, and those at the World Health Organization. There have not been any more cases reported in the United States.

The C.D.C. requested doctors in the San Diego metro area, including the Imperial counties that border on Mexico, to take samples from any patients displaying flu-like symptoms.

Dr. Lyn Finelli of the C.D.C. spoke to reporters over the phone about the two cases citing "both of these kids came to our attention because they were seen in clinics which do routine surveillance for influenza infections."

The doctor assured media spokespeople that both children, a 10-year-old boy and a 9-year-old girl, did not suffer from particularly serious symptoms even though the girl experienced a fever reaching 104 degrees while she was still being treated.

Finelli said: "We are not making the assumption that there are widespread infections out there and there is not any action that the public should take right now."

The C.D.C. claimed to have never seen anything like it before.

In the last two years, 12 verified cases of infection due to a strain of the swine flu had been reported to the C.D.C., but 11 of whom were individuals that had come in contact with pigs.

The C.D.C. concluded in their statement: "Neither child had known contact with pigs. The source of infection is unknown. The lack of known exposure to pigs in the two cases increases the possibility that human-to-human transmission of this new influenza virus had occurred."

Currently, the U.S. Centers for Disease Control are investigating the people the children knew and regularly encountered, and blood testing everyone who claimed to have been ill recently.

The symptoms of the virus are normally tempered and the illness is treatable in most circumstances, although deaths attributed to the virus range from 250,000 to 500,000 in any given year. Health officials around the world worry about the chances of another strain emerging that is entirely immune to antibiotic treatment, causing a pandemic much like the 1968-1969 influenza pandemic that claimed close to 34,000 people. Almost a century ago, the world was engrossed in the worst reported influenze pandemic. Known as the "Spanish flu", this influenza strain, which has since mutated, gripped the world from 1918-1919 and killed between 30 to 100 million people worldwide in the years that followed.

Experts on the virus warn that a pandemic might be right around the corner and that global health community is stepping up efforts to effectively monitor the progress of strains known to be in existence. Authorities are scared the H5N1 avian flu virus, only present in certain birds native to Asia, Europe, Africa, and the Middle East, may mutate into a deadlier form which could lead to a pandemic.

In its present state, the H5N1 avian flu virus generally doesn`t infect people. And while cases in humans are considered rare, the World Health Organization reported that 257 of the 420 known to have been infected have died from the sickness since 2003.

craig-oxley - April 23, 2009 11:40 PM (GMT)

Swine influenza A (H1N1) infection in 2 children - southern California, March/April 2009

----------•----------

On 17 Apr 2009, CDC determined that 2 cases of febrile respiratory illness occurring in children who resided in adjacent counties in southern California were caused by infection with a swine influenza A (H1N1) virus. The viruses from the 2 cases are closely related genetically, resistant to amantadine and rimantadine, and contain a unique combination of gene segments that previously has not been reported among swine or human influenza viruses in the United States or elsewhere. Neither child had contact with pigs; the source of the infection is unknown. Investigations to identify the source of infection and to determine whether additional persons have been ill from infection with similar swine influenza viruses are ongoing. This report briefly describes the 2 cases and the investigations currently under way. Although this is not a new subtype of influenza A in humans, concern exists that this new strain of swine influenza A (H1N1) is substantially different from human influenza A (H1N1) viruses, that a large proportion of the population might be susceptible to infection, and that the seasonal influenza vaccine H1N1 strain might not provide protection. The lack of known exposure to pigs in the 2 cases increases the possibility that human-to-human transmission of this new influenza virus has occurred. Clinicians should consider animal as well as seasonal influenza virus infections in their differential diagnosis of patients who have febrile respiratory illness and who 1) live in San Diego and Imperial counties or 2) traveled to these counties or were in contact with ill persons from these counties in the 7 days preceding their illness onset, or 3) had recent exposure to pigs. Clinicians who suspect swine influenza virus infections in a patient should obtain a respiratory specimen and contact their state or local health department to facilitate testing at a state public health laboratory.

Case reports

Patient A. On 13 Apr 2009, CDC was notified of a case of respiratory illness in a boy aged 10 years who lives in San Diego County, California. The patient had onset of fever, cough, and vomiting on 30 Mar 2009. He was taken to an outpatient clinic, and a nasopharyngeal swab was collected for testing as part of a clinical study. The boy received symptomatic treatment, and all his symptoms resolved uneventfully within approximately one week. The child had not received influenza vaccine during this influenza season. Initial testing at the clinic using an investigational diagnostic device identified an influenza A virus, but the test was negative for human influenza subtypes H1N1, H3N2, and H5N1. The San Diego

County Health Department was notified, and per protocol, the specimen was sent for further confirmatory testing to reference laboratories, where the sample was verified to be an unsubtypable influenza A strain. On 14 Apr 2009, CDC received clinical specimens and determined that the virus was swine influenza A (H1N1). The boy and his family reported that the child had had no exposure to pigs. Investigation of potential animal exposures among the boy's contacts is continuing. The patient's mother had respiratory symptoms without fever in the 1st few days of April 2009, and a brother aged 8 years had a respiratory illness 2 weeks before illness onset in the patient and had a 2nd illness with cough, fever, and rhinorrhea on 11 Apr 2009. However, no respiratory specimens were collected from either the mother or brother during their acute illnesses. Public health officials are conducting case and contact investigations to determine whether illness has occurred among other relatives and contacts in California, and during the family's travel to Texas on 3 Apr 2009.

Patient B. CDC received an influenza specimen on 17 Apr 2009, which had been forwarded as an unsubtypable influenza A virus from the Naval Health Research Center in San Diego, California. CDC identified this specimen as a swine influenza A (H1N1) virus on 17 Apr 2009, and notified the California Department of Public Health. The source of the specimen, patient B, is a girl aged 9 years who resides in Imperial County, California, adjacent to San Diego County. On 28 Mar 2009, she had onset of cough and fever (104.3 deg F [40.2 deg C]). She was taken to an outpatient facility that was participating in an influenza surveillance project, treated with amoxicillin/clavulanate potassium and an antihistamine, and has since recovered uneventfully. The child had not received influenza vaccine during this influenza season. The patient and her parents reported no exposure to pigs, although the girl did attend an agricultural fair where pigs were exhibited approximately 4 weeks before illness onset. She reported that she did not see pigs at the fair and went only to the amusement section of the fair. The Imperial County Public Health Department and the California Department of Public Health are now conducting an investigation to determine possible sources of infection and to identify any additional human cases. The patient's brother aged 13 years had influenza-like symptoms on 1 Apr 2009, and a male cousin aged 13 years living in the home had influenza-like symptoms on 25 Mar 2009, 3 days before onset of the patient's symptoms. The brother and cousin were not tested for influenza at the time of their illnesses.

Epidemiologic and laboratory investigations

As of 21 Apr 2009, no epidemiologic link between patients A and B had been

identified, and no additional cases of infection with the identified strain of swine influenza A (H1N1) had been identified. Surveillance data from Imperial and San Diego counties, and from California overall, showed declining influenza activity at the time of the 2 patients' illnesses. Case and contact investigations by the county and state departments of health in California and Texas are ongoing. Enhanced surveillance for possible additional cases is being implemented in the area.

Preliminary genetic characterization of the influenza viruses has identified them as swine influenza A (H1N1) viruses. The viruses are similar to each other, and the majority of their genes, including the hemagglutinin (HA) gene, are similar to those of swine influenza viruses that have circulated among US pigs since approximately 1999; however, 2 genes coding for the neuraminidase (NA) and matrix (M) proteins are similar to corresponding genes of swine influenza viruses of the Eurasian lineage (1). This particular genetic combination of swine influenza virus segments has not been recognized previously among swine or human isolates in the United States, or elsewhere based on analyses of influenza genomic sequences available on GenBank. Viruses with this combination of genes are not known to be circulating among swine in the United States; however, no formal national surveillance system exists to determine what viruses are prevalent in the US swine population. Recent collaboration between the US Department of Agriculture and CDC has led to development of a pilot swine influenza virus surveillance program to better understand the epidemiology and ecology of swine influenza virus infections in swine and humans.

The viruses in these 2 patients demonstrate antiviral resistance to amantadine and rimantadine, and testing to determine susceptibility to the neuraminidase inhibitor drugs oseltamivir and zanamivir is under way. Because these viruses carry a unique combination of genes, no information currently is available regarding the efficiency of transmission in swine or in humans. Investigations to understand transmission of this virus are ongoing.

Quarantine; L Finelli, DrPH, S Jain, MD, L Brammer, MPH, J Bresee, MD, C Bridges, MD, S Doshi, MD, R Donis, PhD, R Garten, PhD, J Katz, PhD, S Klimov, PhD, D Jernigan, MD, S Lindstrom, PhD, B Shu, MD, T Uyeki, MD, X Xu, MD, N Cox, PhD, Influenza Div, National Center for Infectious and Respiratory Diseases, CDC.]

MMWR editorial note

In the past, CDC has received reports of approximately one human swine influenza virus infection every 1-2 years in the United States (2,3). However, during December 2005-January 2009, 12 cases of human infection with swine influenza were reported; 5 of these 12 cases occurred in patients who had direct exposure to pigs, 6 in patients reported being near pigs, and the exposure in one case was unknown (1,4,5). In the United States, novel influenza A virus infections in humans, including swine influenza infections, have been nationally notifiable conditions since 2007. The recent increased reporting might be, in part, a result of increased influenza testing capabilities in public health laboratories, but genetic changes in swine influenza viruses and other factors also might be a factor (1,4,5). Although the vast majority of human infections with animal influenza viruses do not result in human-to-human transmission (2,3), each case should be fully investigated to be certain that such viruses are not spreading among humans and to limit further exposure of humans to infected animals, if infected animals are identified. Such investigations should include close collaboration between state and local public health officials with animal health officials.

The lack of known exposure to pigs in the 2 cases described in this report increases the possibility that human-to-human transmission of this new influenza virus has occurred. Clinicians should consider animal as well as seasonal influenza virus infections in the differential diagnosis of patients with febrile respiratory illness who live in San Diego and Imperial counties or have traveled to these areas or been in contact with ill persons from these areas in the 7 days before their illness onset. In addition, clinicians should consider animal influenza infections among persons with febrile respiratory illness who have been near pigs, such as attending fairs or other places where pigs might be displayed. Clinicians who suspect swine influenza virus infections in humans should obtain a nasopharyngeal swab from the patient, place the swab in a viral transport medium, and contact their state or local health department to facilitate transport and timely diagnosis at a state public health laboratory. CDC requests that state public health laboratories send all influenza A specimens that cannot be subtyped to the CDC, Influenza Division, Virus

Surveillance and Diagnostics Branch Laboratory

Transmission of Swine H1N1 in Southern California

Recombinomics Commentary 04:10
April 22, 2009

"This virus is different, very different from that circulating in pigs. That was a red flag," Finelli told WebMD and several other news organizations. "The other red flag is both cases appeared almost simultaneously, 100 miles apart.

The above comments leave little doubt that the H1N1 swine flu is being efficiently transmitted human to human in southern California. The unique constellation of swine genes has not been reported previously and the two cases do not have swine contacts. Moreover, family members had symptoms before and after the confirmed cases, indicating the H1N1 spread efficiently within each family.

However, none of the family members were tested because the H1N1 was mild and they recovered without treatment. The two cases were identified through routine surveillance, but such identifications require sero-typing. The swine sequences will test positive fro influenza A.

Therefore the virus can silently spread, which resulted in two independent detections 100 miles apart - see map for general locations. Specific locations within San Diego and Imperial countries have not been released, but upcoming testing of classmates should lead to the identification of location(s).

Although both cases recovered without hospitalization, the spread of the swine H1N1 in a human population is cause for concern. The virus can adapt and spread more efficiently. Moreover, co-infection of H1N1 swine flu and osletamivir resistant H1N1 season flu can lead to acquisition of H274Y by the swine flu via recombination or reassortment. Swine H1N1 with human H1 and N1 have been reported. Moreover, the swine flu can also infect swine and acquire more polymorphisms that could lead to increased virulence.

The 1918 pandemic strain has polymorphism from swine and human H1N1 in all eight gene segments. Similar swapping of polymorphism in human co-infected with season and swine H1N1 can lead to rapid evolution. Therefore, release of both sets of sequences, as well as new sequences, which will likely be detected in the near term in the United States and Mexico, would be useful

QUOTE

I work at a Dr.'s office. We just got a fax this morn from the Minister of Health about this. Definate confirmed cases of swine flu in California. All clinics are to "carry out surveillance." For patients presenting with fever and cough, we are to keep them 1 meter distant from others in the waiting room or isolate in a private room.

There are also clusters of outbreaks in south and central Mexico, Egypt, China and Vietnam. In case anyone is travelling

The Canadian Broadcasting System radio news just reported that there are 10 people in the province of Ontario who have returned recently from Mexico with respiratory problems, they are being monitored. Provincial emergency medical services have been informed. If this story has legs, there should be more information forthcoming.

craig-oxley - April 23, 2009 11:52 PM (GMT)

Mysterious Mexican illness might have hit Cornwall Crown attorney

http://do_not_use_this.com/ckohfr

– Officials are scrambling to deal with a mysterious, SARS-likle illness that has killed an estimated 20 people in Mexico.

A Cornwall Crown attorney who recently returned from Mexico is one of a handful of people who may be linked to the outbreak in that country, according to provincial

officials.

The man, 47 year old Guy Simard, was airlifted to the Ottawa hospital in late March and admitted into the hospital's intensive care unit, a hospital official said yesterday. Simard spent 11 nights in hospital before being released April 9.

The news comes as Ontario officials confirm they have been warned to be on the lookout for illness in Canadians returning from Mexico.

Dr. Arlene King, who leads the Centre for Immunization and Respiratory Infectious Diseases at the Public Health Agency of Canada, said her organization just learned about the severe respiratory outbreak in the "last couple of days."

"There are pneumonia outbreaks, probably of an unknown origin at this point in time, occurring in Mexico," Dr. King told a news conference Thursday, where she was named the province's new chief medical officer of health beginning June 15. "A number of different clusters have occurred over the last month or so… And these have obviously created concern related to their potential to get larger and to spread outside Mexico."

According to reports, Guy Simard's illness was considered life-threatening at one point. The eastern Ontario prosecutor was attached to a ventilator and received at least one blood transfusion, according to the Cornwall Standard-Freeholder.

On Thursday, the province's acting Chief Medical Officer of Health, Dr. David Williams, said Simard's case is one of about 10 being looked at for links with a severe respiratory outbreak in Mexico.

"We haven't ruled it out and we haven't ruled it in either," he told reporters yesterday. "It's still (under) investigation."

Ontario public health officials have asked local authorities to be on the lookout for influenza-like illness among people who have recently traveled to Mexico, where an estimated 20 people have died from the illness in recent weeks.

The deaths are occurring in a worryingly young segment of the population – people 25-44, says Dr. Williams.

"It starts off as a respiratory illness and it just gets worse and worse," he told reporters yesterday. "It's quite severe. We're not talking just a mild issue."

Sixty Swine Flu Fatalities In Mexico Confirm Pandemic Start

Recombinomics Commentary 13:30
April 24, 2009
http://www.recombinomics.com/News/04240903...o_Pandemic.html

A rare outbreak of human swine flu has killed at least 60 people in Mexico and spread to the United States where authorities are on alert, the World Health Organisation said on Friday.

"To date there have been some 800 suspected cases with flu-like illness, with 57 deaths in the Mexico City area," Chaib added.

Twenty four suspected cases and three deaths were also recorded in San Luis Potosi in central Mexico.

The above comment confirm that the swine H1N1 in southwestern United States (see updated map) is the leading edge of a H1N1 pandemic that appears to be centered in Mexico.

These deaths should increase the pandemic phase to 6.

Release of sequences from fatal cases in Mexico would be useful.

craig-oxley - April 24, 2009 03:40 PM (GMT)

Deadly outbreak of swine flu in US, Mexico

24 apr 2009
http://www.google.com/hostednews/afp/artic...lO-2L8Z4q2vDJbw

GENEVA (AFP) — World health authorities on Friday rushed to tackle flu outbreaks in the United States and Mexico that have killed at least 60 people and have pandemic potential.

Hundreds of people in Mexico have been infected and 60 have died from suspected swine flu, while seven human cases have been confirmed in the United States, a World Health Organisation spokeswoman said.

The WHO, which has identified swine influenza as a potential source of a human flu pandemic, activated its global epidemic operations centre while Mexican authorities closed schools in Mexico City and the centre of the country.

Mexico's Health Minister Jose Angel Cordova urged people to avoid large crowds, shaking hands, kissing people as a greeting, or using the subway.

"This afternoon the epidemic was confirmed by Canadian and US labs to be a new influenza virus," Cordova said in a televised statement late Thursday.

But it was unclear if the Mexican flu virus was the same one implicated in the confirmed swine flu outbreaks in the southwestern United States.

The European Centre for Disease Prevention and Control said the "novel" A/H1N1 influenza identified in at least two of the recent cases by US counterparts might have a risk of developing into a pandemic-type virus.

"The infection of humans with a novel influenza A virus infection of animal origins as has happened here is of concern because of the risk, albeit small, that this could represent the appearance of viruses with pandemic potential," the ECDC said on its website.

Referring to "swine flu cases that have broken out in the United States in Mexico," WHO spokeswoman Fadela Chaib said there are "now a total of seven known cases in the United States."

They included five in California and two in Texas, in three clusters, Chaib told journalists.

"Meanwhile in Mexico unusual end of season influenza activity began to be noticed at the end of March, peaking in April."

"To date there have been some 800 suspected cases with flu-like illness, with 57 deaths in the Mexico City area," the WHO spokeswoman said.

Twenty four suspected cases and three deaths were also recorded in San Luis Potosi in central Mexico, she said.

Mexico's health minister reported a total of 20 deaths late Thursday.

"The virus is being described in the United States as a new subtype of A/H1N1. Mexico so far hasn't said anything about the virus, what type of virus it is," said Chaib.

Most of the Mexican cases were found in healthy young adults with no known record of prior illness.

The WHO said it was in constant contact with health authorities in the United States and in Mexico.

Human outbreaks of H1N1 swine influenza virus were recorded in the United States in 1976 and 1988, when two deaths were recorded, and in 1986. In 1988 a pregnant woman died after contact with sick pigs, according to the WHO.

In recent years the global focus for a pandemic has shifted to the H5N1 bird flu virus, which has spread from poultry to humans and killed 257 of the 421 people infected by the virus since 2003.

WHO experts have pointed out that pigs have been implicated in the emergence of new influenza viruses responsible for two of the previous century?s influenza pandemics.

If a pig is simultaneously infected with a human and an avian influenza virus, it can serve as a "mixing vessel" for the two viruses that could combine to create a new more virulent strain.

Mexico City suspends school over flu epidemic

24 Apr 2009
http://www.google.com/hostednews/ap/articl...Acv5BwD97OSI984

MEXICO CITY (AP) — Mexico City has suspended classes at schools and universities to contain what could be a new flu strain.

Health Secretary Jose Cordova says private and public schools in this metropolis of 20 million have been ordered to remain closed Friday. The measure could be extended in coming days.

Cordova says the flu is a "new, different strain that can attack anyone." He says authorities are investigating whether it is related to a unique new form of swine flu reported in Texas and California. All seven people in the U.S. recovered.

The government says at least 20 people have died nationwide from the flu in the last

three weeks, 13 of them in Mexico City.

The total number of cases is estimated to be more than 800.

WHO says it is worried about suspicious flu activity, sending help to Mexico

24 Apr 2009
http://www.google.com/hostednews/canadianp...YBgS4czWlyxl2Ag

TORONTO — The World Health Organization says it is very concerned about mounting evidence of suspicious influenza activity in Mexico and the southwestern part of the United States.

Mexico's health minister has confirmed that some of the cases of illness there were caused by a swine flu virus that is responsible for at least seven human cases in the United States.

A WHO spokesperson says the emergency committee of experts that would determine whether to raise the global pandemic alert level has been informed WHO may call them into action

Gregory Hartl says the WHO is sending staff to Mexico to help in the investigations and try to get a better picture of what is going on.

Hartl says the WHO is extremely concerned because there is evidence of what looks like a novel flu virus spreading in five places - the two U.S. states and three parts of

Mexico.

He says WHO is in continuous contact with the governments of the United States, Canada and Mexico.

craig-oxley - April 24, 2009 10:46 PM (GMT)

> **QUOTE**
>
> They just announced on all TV networks here.. we are in an emergency state. schools are close tomorrow from daycare to all universities.
> They ask the people who is already sick to go immediately to an hospital and avoid all contact with the public.

QUOTE

Just right now on the radio they say they have to close a 24 hours pharmacy because people try to enter by force to get medicine... this is happening right now.

QUOTE

The mexican Health Secretary site "www.salud.gob.mx/" is not available and the mexican leading newspaper's internet site is using half the screen with information on the epidemic. According to this site, dozens are The gathering in health centers to take vaccine. Not only the vaccine is tottally unnefective but all this people crowded together will help the increase of the epidemic, that, in 2 or 3 days, will turn into a pandemic.

QUOTE

My aunt works for a small town hospital in the next county north of ours, she says the district health nurse sent out bulletins on Tuesday to all the county hospitals about this flu threat.

QUOTE

A national alert was issued Wednesday to all hospitals and clinics in Mexico. They are compiling the data. As of yesterday and since March 18th, they was 20 confirmed deaths from this virus (samples were sent to Cdn lab and confrimed as of yesterday this was a new virus, identified with its unique 4 letter/number code). Today, according the Mx Health ministry, there is an additional 40 suspected deaths since March 18th, that have been reported from around the country as of Wednesday. So these havent been confirmed deaths from this new virus, yet.

The epidemic is in Mexico City, with talk of work stoppages and extensions of class closures into next week. All museums are closed. There is also discussions how to minimize travel (nothing specific). Mexico City is THE main travel hub for all of Mexico, and for international travel. So practically ALL travellers come through Mexico City. Perhaps they are discussing changing the port of entry to some other city, I dont know. Everything will depend on this weekend's discussions.

However, since this epidemic has hit Mexico City, the main capital, it is probably too late to implement containment protocols. And they know that...

QUOTE

What you say is true, but I have family working in hospitals and private medical practices in Mexico City, and this is real. Real people are sick and healthy young people are dying. The potential for epidemic is huge unless the health officials pull off a miracle, and given my experience with the Secretary of Health, I am not optimistic (I have worked on cholera prevention brigades, and the biggest obstacle was the bureaucracy and corruption of health officials) . Most of the population in Mexico City has no access to health care, no means of transporting themselves to a clinic, and no money to buy medicine. It is not uncommon for a family of 10 to be living in one or two room dwellings with no running water or bathroom.

At this point, it doesn't matter if this is being fueled by greed. What does matter is that there are people that are sick, and this could get really bad. I see nothing wrong with promoting awareness.

QUOTE

My family and I live NE of San Antonio Texas, and WE HAVE THIS FLU NOW! I've had severe chest congestion, my wife had mainly sore throat, and our youngest had bronchitis and throwing up. Our eldest didn't get it....yet.

We got it last Sunday, like someone turned on a switch!

Before you run up the BS flagpoles, the INCUBATION period puts us being infected, EXACTLY the same time as the reported cases. DON'T BE TOO QUICK TO OVERTHINK THIS REPORTED OCCURRENCE.

I wrote out a longer article that didn't get posted, and I'm not going to write it out again (in case this one gets censored too) but just remember: THE PERCEPTION,NOT THE REALITY, of a coming pandemic, is what will empty the store shelves. Get down there and get what you need, because this flu is really nasty.

We're all OK for now, and it seems to be subsiding, but even the GOOGLE flu page hasn't picked this up yet!

Good Luck.

craig-oxley - April 24, 2009 10:47 PM (GMT)

In California and Texas, 5 New Swine Flu Cases

By Rob Stein
Friday, April 24, 2009
http://www.washingtonpost.com/wp-dyn/conte...9042304116.html

Government scientists have identified five more people who have been infected with swine flu, apparently confirming suspicions that the unusual strain of the respiratory infection is spreading from person to person, federal health officials said yesterday.

Three new cases were found in California and two in Texas, bringing the total number of confirmed cases to seven, officials at the federal Centers for Disease Control and Prevention in Atlanta said. The CDC announced Tuesday that two children had been

infected in San Diego. The agency has launched an investigation to try to determine how widespread the virus is.

Officials said there was no reason for alarm despite the growing number of cases, but they urged doctors to be on the look-out for more cases and said they were intensifying their efforts. They have also taken preliminary steps to create a vaccine against the virus if necessary.

"We don't think this is time for major concern around the country," Anne Schuchat, director of the CDC's National Center for Immunization and Respiratory Diseases, told reporters in a telephone briefing.

"We are taking steps to know more and stay on top of the situation," she said, adding that the agency had alerted the World Health Organization and the Pan American Health Organization.

Two of the new cases involved a father and a daughter in San Diego County, and two others were boys who attend the same school near San Antonio. Those cases, combined with the lack of evidence that any of the infected people had contact with pigs, led officials to believe that the virus was spreading from one person to another, Schuchat said.

"We believe at this point that human-to-human spread is occurring. That's unusual. We don't know how widely it is spreading," she said, adding that she expects more cases to be identified in coming days as the investigation unfolds.

The cases so far involve three females and four males ranging in age from 9 to 54. The first child became ill March 28. The CDC confirmed the three new California cases Wednesday and the two new Texas cases -- in 16-year-old boys -- yesterday. Laboratory testing showed that the virus does not match any known flu strains.

The infection has caused typical flu-like symptoms, including high fever, sore throat and cough, as well as vomiting and diarrhea; one person was hospitalized. But so far, the virus does not appear to be causing serious illness, Schuchat said.

"The good news is all seven of these patients have recovered," she said. The virus appears to be resistant to two drugs normally used to treat the flu, but two others appear to be effective against it.

Genetic analysis of the virus indicates it is highly unusual: It is a hybrid that resulted from a combination of four different viruses -- one that typically infects people, one that originated in North American birds and two from pigs in Europe and Asia.

"This combination has not been recognized before in the U.S. or elsewhere," Schuchat said.

Although the cases all are scattered along the U.S.-Mexico border, officials have not identified any cases in Mexico. But they are continuing to investigate.

craig-oxley - April 24, 2009 10:48 PM (GMT)

Mexico health minister confirms 16 deaths from swine flu

Apr 24 12:17 PM US/Eastern
http://www.breitbart.com/article.php?id=09...&show_article=1

Sixteen people have died from swine flu and authorities are probing 50 more possible deaths from the virus, Health Minister Jose Angel Cordova said Friday.

craig-oxley - April 24, 2009 11:07 PM (GMT)

Here are my notes from the CDC call:

Besser CDC Acting Director

Human Swine Flu Situation

People are concerned about this situation and we are worried as well. Our concern has grown since yesterday as much has been learned since then.

There is much uncertainty.

We are moving quickly to learn as much as possible.

This will be a marathon not a sprint.

Recommendations will change as we learn more about the virus and its transmission.

Local adaptations are important. May be confusing or conflicting information available.

US Gov is working with the WHO and other international partners are working to learn and respond to this international threat.

We do not know if this swine flu virus or some other influenza virus will lead to the next pandemic.

Yesterday reported 7 confirmed cases.

Another additional case confirmed in CA, bringing total to 8.

Do not have enough information to fully assess the health threat.

Tested 14 samples from Mexico; all confirmed positive for swine flu.

We do not have enough information to give us a sense of the extent of this virus.

CDC has sent teams to CA and TX to assist state and local health officials to identify those who may be infected. May send a team to Mexico.

Outbreak notice will be issued to US travelers to Central America and Mexico City.

CDC is not recommending any additional cautions to CA, TX or Mexico.

Vomiting and diarrhea is also associated with the swine flu.

Dispatch will be posted later this afternoon.

Specimens of influenza that cannot be subtyped, please send to CDC.

Webpage created with information and updates.

CDC.gov/flu/swine

800-CDC-INFO

Why more concerned?

A what we learned is that the cluster of cases we are seeing in Mexico is swine flu virus. What we are seeing in the US is a mild swine flu. It is critically important that we find out details of what's going on in Mexico because it is more severe there.

Q Reconfirm no domestic travel restrictions or to Mexico.

A Regular posting applies.

Q Samples from Mexico – any preliminary sequencing been done – how closely related to CA cases? Also talking to vaccine producers about ceasing production for next fall vaccines and working on a swine flu vaccine?

A We are seeing similarity between the viruses. Have created a seed stock of the virus as is done with new influenza viruses. At this point have not made any decisions regarding vaccinations but thought that it was prudent to made the seed stock.

What pandemic threat level are we at?

No change in the pandemic threat level. WHO will be looking at the situation occurring in Mexico and will be looking at convening a meeting.

Q give us some sense of the number of cases and deaths? Conflicting reports.

A We look forward to understanding more about the numbers from Mexico. I refer you to the WHO and Mexican government for that. We are not in a position to offer a number of cases and deaths in Mexico.

Q has been a report that the attack rate and severity is greater in young adult and teenager. Is that true?

A Understanding who is getting sick in Mexico is premature at the moment. But what you usually see in a pandemic is that age group getting sick as opposed to a seasonal influenza.

Q Is there a common thread in the cases in CA and TX?

A That's what we're looking for we have not been able to identify that. We have not identified a common exposure. That's what we need to know…. Looking for undiagnosed cases….

Q Elaborate on analysis on strain from Mexico? All US cases match?

A Yes. All seven isolates matched the genetic component from Mexico that we analyzed.

Q why a difference in severity between US and Mexico?

A That's one of the difference that the labs are looking for.

We have not received details about whether our samples were from patients who have died but we know they are seriously ill.

My understanding is that one of the cases from San Diego had traveled to Mexico.

Q we hope this is going to be limited in Mexico and nothing will happen but what would trigger a higher level of concern? What would that look like?

A There has been extensive planning across the federal government and private sector… planning for influenza pandemic for years and we don't know if this will become pandemic but the level of planning is unprecedented and will allow us to respond in ways we couldn't have ten years ago…. I refer you to our website on pandemic preparedness for specifics on preparation.

WHO is not on the point of declaring a pandemic. We are on the point of discovering more about this virus and how to control it.

Q It seems as though from what has been reported that it is more likely than not that the condition has been meet to raise pandemic alert to level 4. When do you think that you and the WHO will have enough information to make a decision?

A We have been in close contact with the WHO and in close contact with the director regarding this. They convened an expert panel to look at the conditions and determine whether or nto we should raise the status. You are seeing a lot of activity around San Diego, in Texas and in Mexico because that is where it is occurring. What we are seeing is individual preparedness…. What can we as individuals do to prepare for if there is a pandemic. This is a time for people to be thinking about preparing right now.

We are moving quickly and being aggressive in our approach and taking this very seriously. I expect that each day we will be evaluating the situation and making decisions.

CDC has personnel all over the globe and our interactions with Mexico are strong.

Q How concerned should people be outside of Mexico, CA and TX.

A They should pay attention. We are worried about this and treating it very seriously and people need to pay attention to what's going on.

Q Strong interactions with Mexico but has Mexico asked for CDC helped and has anyone talked about containing this virus?

A Not in Mexico yet but anticipate will be there very soon. There are things that suggest that containment is not very likely because we are seeing in CA and TX without any common links between them. Transmission is not likely to be contained.

Q When you talk about spreading person to person through several cycles…?

A When you can find no connections between the sick persons.

Q Why is Canada evaluating Mexico's viruses.

A They provide support to other countries just as we do.

Q 14 samples from Mexico, 7 positive. Can we say in a simple statement that it is the same virus in Mexico, CA and TX

A I think we can safely say that. As information changes we will share it but so far genetic elements are the same.

Q What were the other 7 samples?

A Other 7 samples came up negative for swine flu but we can't really say anything else about them.

Q Details on the newest case in San Diego

A refer you to the health dept there I don't have those specific details but I believe the child has recovered and was not hospitalized. We are looking at patients in the areas where we've seen cases so far but it's important that clinicians have a high index of suspicion. We are just learning about this virus and transmission.

Q Cases in Mexico – any of those people had contact with swine and much travel between Dallas and Mexico – anything local officials should be doing near buses, airports, areas of travel?

A No details about cases in Mexico. In terms of travel screening, there are 400 million crossings of the border between US and Mexico a year. Best approach is to encourage people who are sick not to travel.

Thank you very much appreciate your questions we will be providing regular updates.

craig-oxley - April 24, 2009 11:09 PM (GMT)

Situation Update- cases NEAR the US BORDER...

Situation Update No. 12
On 24.04.2009 at 20:18 GMT+2

Mexico has reported a third possible outbreak of swine flu in Mexicali, near the U.S. border, with four suspect cases and no deaths to date, the World Health Organisation (WHO) said on Friday. The WHO also said that the viruses in the outbreaks in Mexico and the United States had not been detected in pigs or humans before but were proving sensitive to Tamiflu. Known generically as oseltamivir, the pill by Swiss drugmaker Roche Holding can both treat flu and prevent infection. "Because there are human cases associated with an animal influenza virus, and because of the geographical spread of multiple community outbreaks, plus the somewhat unusual age groups affected, these events are of high concern," the Geneva-based agency said in a statement.

Situation Update No. 13
On 24.04.2009 at 20:19 GMT+2

The World Health Organization (WHO) said on Friday that it was prepared with rapid

containment measures including antivirals if needed to combat the swine flu outbreaks in Mexico and the United States. The Geneva-based agency has been stockpiling doses of Roche AG's Tamiflu, known generically as oseltamivir, a pill that can both treat flu and prevent infection. But health authorities in the two North American countries have the resources required already in place, including Tamiflu, and are "well equipped," according to the WHO. "WHO is prepared with rapid containment measures should it be necessary to be deployed," WHO spokeswoman Aphaluck Bhatiasevi told Reuters. The United Nations agency saw no need at this point to issue travel advisories warning travelers not to go to parts of Mexico or the United States. "However, the situation may change depending on what the situation in the field is," Bhatiasevi said.

The WHO will convene a meeting of its Emergency Committee on international health regulations, probably on Saturday afternoon, she added. WHO director-general Margaret Chan was flying back to Geneva overnight from Washington, D.C., for the emergency discussions which would link public health authorities and experts in various parts of world in a virtual meeting, she said. The emergency committee could make recommendations including whether to change the pandemic alert level, but it would be up to Chan and the WHO whether to do so, she added. Suspicions that the fatal outbreaks of flu in Mexico were not of the normal seasonal influenza arose because most cases were in healthy young adults, WHO spokesman Gregory Hartl said. "Because these cases are not happening in the very old or the very young, which is normal with seasonal influenza, this is an unusual event and a cause for heightened concern," Hartl said in an interview with Canadian broadcaster CBC.

CDC says too late to contain U.S. flu outbreak

24 Apr 2009 19:31:20 GMT
http://www.alertnet.org/thenews/newsdesk/24443479.htm

WASHINGTON, April 24 (Reuters) - The U.S. Centers for Disease Control and Prevention said on Friday it was too late to contain the swine flu outbreak in the United States.

CDC acting director Dr. Richard Besser told reporters in a telephone briefing it was likely too late to try to contain the outbreak, by vaccinating, treating or isolating people.

"There are things that we see that suggest that containment is not very likely," he said.

He said the U.S. cases and Mexican cases are likely the same virus. "So far the genetic

elements that we have looked at are the same." But Besser said it was unclear why the virus was causing so many deaths in deaths in Mexico and such mild disease in the United States.

Event: Epidemic Hazard
Location: Mexico Mexico City, San Luis Potos?, Oaxaca and Baja

Situation

Mexican authorities said 60 people may have died from a swine flu virus in Mexico, and world health officials worry it could unleash a global flu epidemic. Mexico City closed schools across the metropolis Friday in hopes of containing the outbreak that has sickened more than 900. Scientists were trying to determine if the deaths involved the same new strain of swine flu that sickened seven people in Texas and California - a disturbing virus that combines genetic material from pigs, birds and humans in a way researchers have not seen before. The World Health Organization was looking closely at the 60 deaths - most of them in or near Mexico's capital. It wasn't yet clear what flu they died from, but spokesman Thomas Abraham said "We are very, very concerned." "We have what appears to be a novel virus and it has spread from human to human," he said. "It's all hands on deck at the moment." WHO raised its internal alert system Friday, preparing to divert more money and personnel to
dealing with the outbreak.

President Felipe Calderon cancelled a trip and met with his Cabinet to coordinate Mexico's response. The government has 500,000 flu vaccines and planned to administer them to health workers, the highest risk group. There are no vaccines available for the general public in Mexico, and authorities urged people to avoid hospitals unless they had a medical emergency, since hospitals are centers of infection. They also said Mexicans should refrain from customary greetings such as shaking hands or kissing cheeks, and authorities at Mexico City's international airport were questioning passengers to try to prevent anybody with possible influenza from boarding airplanes and spreading the disease. But the U.S. Centers for Disease Control and Prevention said Americans need not avoid traveling to Mexico, as long as they take the usual precautions, such as frequent handwashing.

Mexico's Health Secretary, Jose Cordova, said only 16 of the deaths have been confirmed as the new swine flu strain, and that government laboratories were testing samples from 44 other people who died. At least 943 nationwide were sick from the

suspected flu, the health department said. "We certainly have 60 deaths that we can't be sure are from the same virus, but it is probable," Cordova said, adding that samples were sent to the CDC to look for matches with the virus that infected seven people in Texas and California. Cordova called it a "new, different strain ... that originally came from pigs."

Epidemiologists are particularly concerned because the only people killed so far were normally less-vulnerable young people and adults. It's possible that more vulnerable populations - infants and the aged - had been vaccinated against other strains, and that those vaccines may be providing some protection. Dr. Anne Schuchat of the CDC said "at this point, we do not have any confirmations of swine influenza in Mexico" of the kind that sickened seven California and Texas residents. All seven recovered from symptoms that were like those of the regular flu, mostly involving fever, cough and sore throat, though some of the seven also experienced vomiting and diarrhea. Scientists have long been concerned that a new flu virus could launch a pandemic, a worldwide spread of a killer disease. A new virus could evolve when different flu viruses infect a pig, a person or a bird, mingling their genetic material. The resulting hybrid could spread quickly because people would have no natural
defenses against it.

Closing the schools across the metropolis of 20 million kept 6.1 million students home from day care centers through high schools, and thousands more were affected as colleges and universities closed down. Parents scrambled to juggle work and family concerns due to what local media said was the first citywide schools closure since Mexico City's devastating 1985 earthquake. Authorities also advised capital residents not to go to work if they felt ill, and to wear surgical masks if they had to move through crowds. A wider shutdown - perhaps including shutting down government offices - was being considered. "It is very likely that classes will be suspended for several days," Cordova said. "We will have to evaluate, and let's hope this doesn't happen, the need to restrict activity at workplaces." Mexico's initial response in its overcrowded capital brought to mind other major outbreaks - such as when SARS hit Asia. At its peak in 2003, Beijing was the hardest-hit city in the world.
Schools, cinemas and restaurants were shuttered to prevent the spread the deadly respiratory virus, and thousands of people were quarantined at home.

Situation Update No. 11

On 2009-04-24 at 1943 [UTC]

Event: Epidemic Hazard
Location: Mexico Mexico City, San Luis Potos?, Oaxaca and Baja

Situation

The U.S. Centers for Disease Control and Prevention said on Friday it was too late to contain the swine flu outbreak in the United States. CDC acting director Dr. Richard Besser told reporters in a telephone briefing it was likely too late to try to contain the outbreak, by vaccinating, treating or isolating people. "There are things that we see that suggest that containment is not very likely," he said. He said the U.S. cases and Mexican cases are likely the same virus. "So far the genetic elements that we have looked at are the same." But Besser said it was unclear why the virus was causing so many deaths in deaths in Mexico and such mild disease in the United States.

Report by WHO:

The United States Government has reported seven confirmed human cases of Swine Influenza A/H1N1 in the USA (five in California and two in Texas) and nine suspect cases. All seven confirmed cases had mild Influenza-Like Illness (ILI), with only one requiring brief hospitalization. No deaths have been reported. The Government of Mexico has reported three separate events. In the Federal District of Mexico, surveillance began picking up cases of ILI starting 18 March. The number of cases has risen steadily through April and as of 23 April there are now more than 854 cases of pneumonia from the capital. Of those, 59 have died. In San Luis Potosi, in central Mexico, 24 cases of ILI, with three deaths, have been reported. And from Mexicali, near the border with the United States, four cases of ILI, with no deaths, have been reported. Of the Mexican cases, 18 have been laboratory confirmed in Canada as Swine Influenza A/H1N1, while 12 of those are genetically identical to the Swine Influenza A/H1N1 viruses from California.

The majority of these cases have occurred in otherwise healthy young adults. Influenza normally affects the very young and the very old, but these age groups have not been heavily affected in Mexico. Because there are human cases associated with an animal influenza virus, and because of the geographical spread of multiple community outbreaks, plus the somewhat unusual age groups affected, these events are of high concern. The Swine Influenza A/H1N1 viruses characterized in this outbreak have not been previously detected in pigs or humans. The viruses so far characterized have been sensitive to oseltamivir, but resistant to both amantadine and rimantadine. The World Health Organization has been in constant contact with the health authorities in the United States, Mexico and Canada in order to better understand the risk which these ILI events pose. WHO (and PAHO) is sending missions of experts to Mexico to work with health authorities there. It is helping its Member States to increase field epidemiology activities, laboratory diagnosis and clinical management. Moreover, WHO's partners in the Global Alert and Response Network have been alerted and are ready to assist as requested by the Member States. WHO acknowledges the United States and Mexico for their proactive reporting and their collaboration with WHO and

will continue to work with Member States to further characterize the outbreak.

Event: Epidemic Hazard
Location: Mexico Mexico City, San Luis Potos?, Oaxaca and Baja

Situation

Mexico canceled classes for millions of children in its sprawling capital city and surrounding area on Friday after influenza killed more than 20 people in recent weeks. The World Health Organization said it was concerned over what it called 800 “influenza-like” cases in Mexico, and also about a confirmed outbreak of swine flu in the United States. U.S. health authorities were unsure whether the outbreak of a new kind of swine flu in California and Texas, which have borders with Mexico, was related to the unusually late and severe flu season in that country.

Mexican authorities say the flu outbreak has killed around 20 people, but WHO said about 60 people have died in the country. The Geneva-based U.N. agency said it was in daily contact with U.S., Canadian and Mexican authorities and had activated its Strategic Health Operations Center (SHOC) -- its command and control center for acute public health events. There have been some 800 suspected cases with flu-like illness, with 57 deaths in the Mexico City area, and a further 24 suspected cases and three deaths in San Luis Potosi in central Mexico, WHO spokeswoman Fadela Chaib said. Mexican Health Minister Jose Angel Cordova said schools and universities in Mexico City and the surrounding area would be temporarily closed on Friday and advised people with flu symptoms to stay home from work. “It is a virus that mutated from pigs and then at some point was transmitted to humans,” Mr. Cordova told the Televisa network. “We’re dealing with a new flu virus that
constitutes a respiratory epidemic that so far is controllable,” He said late on Thursday.

Some 20 million people live in Mexico City and the surrounding metropolitan area. Canada’s government advised doctors to be on the alert for reports of illness from people who recently traveled to Mexico, although it did not advise against visiting the country, a popular destination for beach vacations. Mexico’s flu season normally ends in February or March, but it has lasted longer this year, the government said. “We recommend avoiding places or events with a lot of people unless strictly necessary,” Cordova said in an unusual late-night live statement to media. About 79 people, possibly ill with the flu, are being treated in Mexico and that number has not increased in recent days, the health ministry said. Worldwide, seasonal flu kills between 250,000 and 500,000 people in an average year.

In the United States, seven people have been diagnosed with a new kind of swine flu in California and Texas, the U.S. Centers for Disease Control and Prevention reported. All seven people there have recovered but the virus itself is a never-before-seen mixture of viruses typical among pigs, birds and humans, the CDC said. “We are likely to find

more cases," the CDC's Dr Anne Schuchat said. "We don't think this is time for major concern around the country. Canadian officials have been particularly sensitive to the international spread of respiratory illnesses since Toronto was hit by the SARS epidemic in 2003, which was blamed partly on a slow response to early disease reports.

WHO Ready With Antiviruals To Combat Swine Flu

Published on 04-24-2009 Email To Friend Print Version
http://www.reuters.com/article/healthNews/...&rpc=22&sp=true

The World Health Organization (WHO) said on Friday that it was prepared with rapid containment measures including antivirals if needed to combat the swine flu outbreaks in Mexico and the United States.

The Geneva-based agency has been stockpiling doses of Roche Holding's Tamiflu, known generically as oseltamivir, a pill that can both treat flu and prevent infection.

The new virus, not previously detected in pigs or humans, has proved sensitive to the drug, the WHO said in a statement.

The WHO and its regional office in Washington, D.C., are also sending experts to Mexico to help health authorities with disease surveillance, laboratory diagnosis and clinical management of cases.

Mexican health officials have reported more than 850 cases of pneumonia in the capital, Mexico City, including 59 who died. In San Luis Potosi, in central Mexico, 24 cases including 3 deaths have been detected.

They have also informed the WHO about a third suspected outbreak of swine flu in Mexicali, near the U.S. border, with four suspect cases and no deaths so far.

The U.S. Centers for Disease Control have said there were 8 cases of swine influenza in California and Texas and no deaths.

Health authorities in the two North American countries have the resources required already in place, including Tamiflu, and are "well equipped," according to the WHO.

"WHO is prepared with rapid containment measures should it be necessary to be deployed," WHO spokeswoman Aphaluck Bhatiasevi told Reuters.

The United Nations agency saw no need at this point to issue travel advisories warning travelers not to go to parts of Mexico or the United States. "However, the situation may change depending on what the situation in the field is," she said.

The WHO will convene a meeting of its Emergency Committee on international health regulations, probably on Saturday afternoon, she added.

WHO director-general Margaret Chan was flying back to Geneva overnight from Washington, D.C., for the emergency discussions which would link public health

authorities and experts in various parts of world in a virtual meeting, she said.

The emergency committee could make recommendations including whether to change the pandemic alert level, she added.

"Because there are human cases associated with an animal influenza virus, and because of the geographical spread of multiple community outbreaks, plus the somewhat unusual age groups affected, these events are of high concern," the WHO said in a statement.

Previous Swine Flu Outbreak Originated At Fort Dix

Mass vaccination program was halted after hundreds contracted debilitating nerve disease

Steve Watson
Infowars.net
Friday, April 24, 2009

Given the reports of the possibility of a swine flu epidemic, is interesting to note that last time there was a significant outbreak of a new form of swine flu in the U.S. it originated at the army base at Fort Dix, New Jersey.

Hundreds of soldiers on the base, mostly recruits, were infected without becoming ill in 1976.

President Gerald Ford immediately ordered a nationwide vaccination program.

More than 40 million people were vaccinated. However, the program was stopped short after over 500 cases of Guillain-Barre syndrome, a severe paralyzing nerve disease, were reported. 30 people died as a direct result of the vaccinations.

Unanswered questions regarding the outbreak remain to this day. According to a CDC investigation, It is not known why the virus did not extend beyond basic trainees or beyond the military base. The source of the virus, the exact time of its introduction into Fort Dix, and factors limiting its spread and duration remain unknown.

Previous reports of attempts to use influenza as a bio weapon, should also have us asking concerned questions. See below for further reading.

View Full Version: H1N1 S188T Dominant In Southern Hemisphere

Title: H1N1 S188T Dominant In Southern Hemisphere

TheUnhivedMind - July 21, 2011 03:29 AM (GMT)

H1N1 S188T Dominant In Southern Hemisphere

July 20, 2011
http://www.recombinomics.com/News/07201101...T_Southern.html

The CDC released another series of H1N1 sequences from 2011. A subset was from the United States, but most sequences were from the southern hemisphere. The majority of these sequences were from the sub-clade with S188T, which was the dominant sub-clade in the northern hemisphere in the 2010/2011 season.

The sequences did not include new Chihuahua isolates or those with Tamiflu resistance (H274Y or S246N), but the number of sequences were limited and it is not clear how represented they were. In the prior release the sequences included two from Mexico, but neither were the Chihuahua sub-clade, the most common 2011 sequence released by the national labs in Mexico, although one of the two sequences did have D225N, but on the genetic background with S186P. The presence of D225N, which in the past has been rare, on another genetic background raises concerns that D225N is becoming more common, as indicated in anecdotal reports.

The latest sequences, again included no data from Delaware or Maryland. The four most recent H1N1 sequences from each state had H274Y and phylogenetic analysis supported increases due to recombination as well as clonal expansion. Moreover, Delaware report 10 additional cases with H274Y, as reported to them by the CDC, but the CDC had yet to release sequences from these additional cases, which almost certainly would extend the data from the 8 earlier cases. The absence of any additional data from the 10 lab confirmed cases, raises concerns that the sequences being released are not representative of the more recent data generated by the CDC.

Release of sequences from the Delaware and Maryland, as well as more sequences

from Mexico and other collections from the southern hemisphere would be useful.

TheUnhivedMind - July 15, 2011 04:50 PM (GMT)

First of all people you know that the 'Bird Flu' is the real pandemic agenda and that the 'Swine Flu' has been a conditioner and test run right? You all know the depopulation program by the Club of Rome and how The Worshipful Company of Apothcaries will be behind its spread along with The Worshipful Company of Fuellers controlling the military vectoring of the pandemic via aerosol methods etc. If its not the 'Bird Flu' it will be pneumonic plague they'll be spreading when they're ready.

Now I've said I expect the economy to be destroyed by October next year in 2012. Please note how this film is being released on September 9th 2011 giving us a 9/11 signal I believe. I also believe that this pandemic may happen around September 2012 as a great cover-up of the economic collapse and a way of controlling the chaos through a quarantine Martial Law system. Troops will not think twice about killing their own when dealing with a supposed pandemic. How long do we have to keep being conditioned before people wake up to the agenda at hand? Just look at the Global 2000 Report of the Club of Rome, or the United Nations Agenda 21 hidden as Vision, Sustainable Development, Comprehensive Planning and Smart Growth. When the economy was about to go over the cliff in 2009 they bought out the 'Swine Flu' pandemic as I expected and warned you all about in my first series of audios. Remember when you have a crisis like a pandemic or climate event etc, this can bring about eminent domain which

nulls all contracts by both parties. This comes in handy with a very dire economic situation like we have today. Don't be surprised if this doesn't happen shortly.

Remember the Nazis have done away with the herbal medicines in Europe, Australia and other areas and now they're working on the United States. You can take it to the bank that when they've destroyed all forms of defense we have left, then they'll attack, knowing you have no defense any longer against them. So watch for serious ramping up of attacks on herbal medicines and watch for what pharmaceutical medicines are going short and work out its all coming soon. They're not showing you all these zombie films for nothing folks. What a great way of killing off millions of unemployed people from the Global Depression. You know those useless eaters and mindless breeders as Jesuit trained, Kristine Marcy of the Senior Executive Service calls you.

TheUnhivedMind - July 15, 2011 05:38 PM (GMT)

Drug shortages slam patients, health workers, surveys show

Delayed or diverted care, staffing pressures, high costs all getting worse

7/12/2011 10:00:29 AM ET
http://www.msnbc.msn.com/id/43718291/ns/health-health_care/

Escalating shortages of vital drugs could be affecting nearly every hospital in the nation, forcing delays or substitutions in patient care, diverting pharmacy staff from crucial duties and racking up $216 million in costs to manage the situation nationwide.

That’s the take-away message of two new surveys about the impact of rising drug shortages on clinical staff and patients, conducted by the American Hospital Association and the American Society of Health-System Pharmacists.

The groups planned to hold a Capitol Hill briefing Tuesday about the consequences of the worst-ever shortage of medically necessary and life-saving drugs in the nation’s history. A coalition of cancer care organizations, concerned about a shortage of oncology drugs, plan a similar briefing on Wednesday. The groups worry that ongoing shortages of drugs, often with no warning, have been skyrocketing in recent years.

Federal Food and Drug Administration officials say the shortages are caused by manufacturing problems, firms that simply stop making drugs, and production delays.

In 2010, reported drug shortages totaled 211, up from 166 the year before and the most ever recorded. Already in 2011, 156 shortages were tallied as of June 20, according to the University of Utah Drug Information Service, which tracks the problem.

Story: When vital drugs run out, patients pay the price

“Drug shortages are a national health crisis,” said Henri R. Manasse Jr., executive vice president and CEO of ASHP, a coalition of pharmacists who practice in hospitals and health systems.

Survey: 99.5 percent of hospitals affected
Among the findings from AHA’s online survey that drew responses from 820 of the nation’s 5,100 hospitals: 99.5 percent of hospitals reported one or more drug shortages in the last six months, and nearly half reported shortages of 21 or more drugs. Some 82 percent of those hospitals said they’ve delayed patient treatment because of shortages, or have been unable to treat patients as recommended.

The ASHP survey, which drew 353 responses from 1,322 pharmacy directors, found that more than 80 percent of institutions ran low on three top vital drugs: succinylcholine injection, used to relax throat muscles to allow intubation; concentrated dextrose solutions used to mix or dilute medications; and epinephrine injections used for emergency treatment of severe allergic reactions.

The shortages have forced some clinical staff to shift away from patient duties in order to manage the problem, found the ASHP survey, which tallied the labor costs at $216 million a year nationwide.

In addition, the surveys both chronicled ongoing shortages of drugs used to for basic treatments from pain relief and sedation to antibiotics for infections and medications for cancer.

Nearly two-thirds of hospitals said they rarely receive advance notices of shortages and 14 percent never do, the AHA survey said. More than half said they're rarely told how long the shortages will last.

The studies released this week mirror a survey this spring that showed 90 percent of anesthesiologists responding — some 1,373 doctors in 48 states — said they had experienced shortages of vital drugs. More than half had to alter their care for patients and 10 percent postponed or canceled treatments because of shortages, according to the American Society of Anesthesiologists.

Patient had to track down his own drugs
For Thomas Kornberg, 62, of San Francisco, Calif., shortages threatened to derail his treatment for Hodgkin’s lymphoma two years ago when doctors informed him they couldn’t get two of four drugs necessary for his cancer-fighting infusions.

“I was warned ahead of time, the hospital did not have an adequate supply,” said Kornberg, a professor of biochemistry and biophysics at the University of California at San Francisco. Because he had contacts in the medical field, he was able to call in

favors from friends at hospitals who helped ensure his supply.

But the experience outraged him enough to prompt him to testify on Capitol Hill this week. “These shortages could well have affected my treatment,” he said.

The issue has received attention from Congress, the Preserving Access to Life-Saving Medications Act. That bill would require drugmakers to give early notification of any incident that would likely result in a drug shortage.

Such action alone wouldn’t solve the pressing problems, said Joseph Hill, director of federal legislative affairs for the ASHP, which since November has been working with industry, government and safety groups to find a solution.

“It’s a good first start,” he said. “It’s a piece of the puzzle."

New gonorrhoea strain resistant to all available antibiotics

Could lead to global health emergency

Mon 11 Jul, 2011 07:00 am BST
http://uk.health.lifestyle.yahoo.net/new-s...otics-found.htm

An international team of scientists has discovered a new strain of the sexually transmitted infection (STI) gonorrhoea that is resistant to all currently available antibiotics.

Gonorrhoea is currently a widespread but easily treatable condition. It is estimated to be one of the most common STIs in the world, with around 700,000 cases annually in the US alone.

Scientists successfully identified a previously unknown variant of the bacterium that causes gonorrhoea, Neisseria gonorrhoeae. This new strain, called H041, was found to have extreme resistance to all cephalosporin-class antibiotics, the last remaining drugs still effective in treating gonorrhoea.

Commenting on the findings, study leader Dr Makoto Ohnishi said: "This is both an alarming and a predictable discovery - since antibiotics became the standard treatment for gonorrhoea in the 1940s, this bacterium has shown a remarkable capacity to develop resistance mechanisms to all drugs introduced to control it."

He warned that new treatments need to be developed to meet the threat posed by the new bug.

"The history of newly emergent resistance in the bacterium suggests that it may spread

rapidly unless new drugs and effective treatment programs are developed," Dr Ohnishi said.

If left untreated, gonorrhoea can lead to serious and irreversible health complications in both women and men.

For instance, in women it can cause chronic pelvic pain and ectopic pregnancy. It can lead to infertility, mostly in women but also in men, and it increases the risk of HIV transmission. In 3 to 4% of cases untreated infections spread to the skin, blood, joints, or even the heart, and can cause potentially mortal lesions.

Results of the study will be presented at the 19th conference of the International Society for Sexually Transmitted Disease Research (ISSTDR) in Quebec City, Canada.

What have you heard about tickborne Lyme for the last 30 years? That it's rare, scary, acute, treatable… The government warns about its spread and implores people to go to a doctor upon seeing the telltale bulls-eye rash. What happens when they actually do?

Many have researched the controversial beginnings of Lyme disease, but this article focuses on what happens to victims when they contract it and what they can do now.

Under Our Skin is a documentary that lends a voice to the many who in fact suffer from chronic Lyme and are victims of a greater abomination.

Why do conventional doctors tell them it's in their head? Why won't they quickly test for it? Treat it? Acknowledge it? Why do medical boards shut down doctors who can treat and cure Lyme?

Lyme's Disease is NOT RARE – Bigger Than AIDS

In the late '70s, a Lyme, Connecticut mom reported a mysterious new disease sweeping the town, leaving its people with debilitating, chronic symptoms. In 1981, Dr. Willy Burgdorfer discovered the Lyme bacteria, called Borrelia burgdorferi.

The bacteria spirochetes closely resemble syphilis in their make up. While a carrier tick is feeding, its backwash enters the host and transmits Lyme. The corkscrew spirochetes wreak havoc, drilling into any healthy cells and tissue. They create painful, crippling neurological and immunological damage.

In the beginning, doctors only knew that it resembled syphilis but remained unaware of its wide spread, how to proceed, and the political, medical clash that awaited them.

In recent years, the CDC has reported over 35,000 new Lyme cases annually but admit that since it is so overlooked the actual number may be 12 times higher, up to 420,000 cases each year.

Think of how much more likely it is to contract Lyme than the media-touted West Nile virus which is only reported at around 1,300 cases annually. If the actual number of Lyme cases is even just a modest amount above the CDC's 35,000, then Lyme is far more prevalent than AIDS, reported at 39,000 cases annually.

Since 1982, the number of cases continues to climb and spike prompting media reports and health officials to label it epidemic as early as 1989. Reported cases have tripled since 1992. Every summer we hear the same cautionary reports. Yet doctors constantly tell their patients "You don't have Lyme" or "Lyme only happens in such-and-such state, not here."

Lyme is a national health crisis in every state and has traveled the globe!

Since this infectious disease is viewed with eyes that won't see and hands that won't treat, the miniscule 35,000 reported cases are unquestionably a mere fraction of people sick with Lyme.

Patients often look normal and are told they have M.S., Lou Gehrig's, psychological disorders, Parkinson's, ADHD but not Lyme. Therefore, many walk around with Lyme and have no clue why they are so ill, why treatments don't work and are left to wonder. Many are left to die.

Without Early Eradication Lyme is Chronic, Expensive, Does Not Leave Easily
Lyme patients often state that they've seen an average of 30 doctors, spent over $100,000 in medical care and waited up to 15 years for a Lyme diagnosis. Why??

Lyme disease antibodies can be detected early with a blood test. If caught early it can be treated with an inexpensive bottle of antibiotics. But that is rarely the case. Patients are told it's not Lyme, it won't be tested for, it's something else and so the struggle begins….

When the patient remains ill, why, it couldn't possibly be chronic Lyme because doctors view it as acute and are not allowed to believe chronic Lyme exists. If "acute" Lyme isn't

cured with two weeks of antibiotics, which it won't be if the bacteria has taken hold due to waiting, then the patient is told it must be something else and years of sickness, pain, and ineffective treatments ensue.

Talk to someone who's been through this battle. They will most likely tell you they were dismissed, referred to psychiatrists and multiple specialists. Lyme can attack any area of the body and manifest endless symptoms.

Lyme patients have seen specialists for chronic pain, arthritis, Chrohn's, iritis, organ failure, brain and neurological problems, dyslexia, insomnia…you name it. All for one disease that could have been treated early. But no one will believe them and after seeing so many specialists they are often labeled crazy, hypochondriacs, attention loving, and depressed.

The spirochetes can cleverly avoid the antibiotics and hide from the immune system. It's frightening to think that specialists often prescribe immune suppressive drugs – the most counterproductive plan for Lyme patients.

The CDC now hints at chronic Lyme with sarcastic quote marks and insists that it be called Post-Treatment Lyme Disease Syndrome (PTLDS). They openly admit that the first round of conventional treatment might not bring a cure and that the patient is in for a long ride of pain and sometimes years of antibiotics, the only recognized conventional treatment.

They LIE and state that there is no credible scientific evidence that PTLDS is caused by persistent infection, that it must be residual damage, that the Lyme is gone. They also make a big point in telling people to avoid their own research on the internet, not to believe the inaccurate information out there, just keep seeing the doctor who left them untreated for so long.

The CDC says before PTLDS treatment takes place, confirm the diagnosis – fat chance that will happen.

So how did that fiasco begin?

Title: Alarming Increase In H1N1 Low Reactors In Japan

TheUnhivedMind - July 3, 2011 03:28 AM (GMT)

Alarming Increase In H1N1 Low Reactors In Japan

July 1, 2011
http://www.recombinomics.com/News/07011101...Japan_2011.html

Today NIID released 37 HA sequences from 2011 (at GISAID), which were associated with frequent Tamifu resistance (H274Y) in most associated NA sequences, as well as one NA sequence with S246N, signaling additional clonal expansion.

However, the HA sequences had an alarming number of changes at positions 156-159, with 6,1,9,2 changes respectively. The prior data on 33 HA sequences from Japan had postion 156-159 chnages of 1,3,5,1, respectively. Changes at these positions are linked to low reactors which have titers reduced four fold or more when tested against the current H1N1 vaccine target, A/California/07/2009. These numbers are likely to represent an underestimate because the isolates involved growth on mammalian MDCK cells, which are rich in gal 2,6 gal. Isolation with eggs, which are rich in 2,3 gal receptors would have selected addition examples of changes at this position. These changes are biologically and clinically relevant because they are associated with vaccine escape as well as preferential growth in human lung, which is rich in gal 2,3 receptors.

The changes are increasing in prevalence, but these alarming changes are being discounted with claims that the changes are artifacts of culture since detection is more difficult in direct sequencing of clinical samples since the changes are frequently present as mixtures with wild type.

The discounting of these changes has significant consequences. In the United States Pneumonia and Influenza (P&I) deaths were at record levels in 2011 and were similar to rates recorded in 2008. However, in 2008 the vaccine mismatches with all three

vaccine target were eventually acknowledged and all three targets were updated for the following season. In contrast, in 2011 claims were made that all three targets were “matches” due in part to extensive manipulation of laboratory test results, including claims that negative data invalidated positive data. Consequently, all three vaccine targets remained unchanged for the 2011/2012 season.

In addition to the elevated P&I death rate, the frequency of Tamiflu resistance has also increased and significant clonal expansion has been seen in the United States and Japan for H274Y. The reported numbers are underestimates because WHO collaborating centers have agreed to not report Tamiflu resistance when H274Y levels are less than 50% of the sample signal. In addition, clonal expansion of Tamiflu and Relenza resistance (S246N) has been reported in Singapore and Australia, including 30% of H1N1 isolates from Darwin.

These increases in low reactors as well as Tamiflu resistance highlight the folly of lab manipulations to generate under-estimates for “scientific” public reports published by government and international agencies, and these policies and publications remain hazardous to the world’s health.

Title: More nonsense trying to link a monkey virus in man
Description: *naturally for MS*

TheUnhivedMind - July 3, 2011 03:25 AM (GMT)

Monkey multiple sclerosis discovered in Oregon suggests virus may cause human disease

Published: Tuesday, June 28, 2011
http://www.oregonlive.com/health/index.ssf...rosis_disc.html

In 1986, an unknown disease began killing monkeys at the Oregon National Primate Research Center in Hillsboro. Affected animals developed an unsteady gait and a rapidly advancing paralysis of the limbs. Caregivers could do nothing to stop the disease and euthanized most of the helpless animals within a week of symptom onset.

The disease, researchers now report, is the monkey equivalent of multiple sclerosis. And it appears to be caused by a virus – adding support to the possibility that multiple sclerosis in humans can be triggered by a viral infection. Experts say the discovery could help expedite the search for more effective treatments.

"That's the ultimate goal," said co-author Scott Wong, a scientist at the primate center and Oregon Health & Science University's Vaccine and Gene Therapy Institute.

Since the first case appeared at the primate center, 56 monkeys in the Japanese macaque colony have fallen ill with the neurological disease. In most years, no more than four cases appear in the population of more than 300 monkeys. In a few cases, the monkeys recovered and lived normally for many months before relapsing -- a course often seen in people with multiple sclerosis, or MS.

Wong and colleagues studied brain and spinal cord samples from nearly all of the monkeys after death. Microscopic examination revealed damage very similar to that in MS patients, including nerve fibers stripped of their protective sheath. Brain scans

performed on eight living monkeys showed scattered patches of dead and damaged nerve cells also similar to those seen in people with MS.

The researchers isolated a previously unknown virus from a sample of damaged spinal nerve tissue taken from one animal. DNA analysis showed that the virus belongs to the herpes family of viruses. Wong's team developed a sensitive test for the virus and used it to screen samples from healthy and diseased monkeys. So far, they have detected the virus in samples of damaged nerve tissue from six monkeys that died from the disorder. The virus has not showed up in healthy samples.

"Whether or not a similar virus might actually cause MS, that's the big issue," said Dr. Dennis Bourdette, a co-author of the study and director of OHSU's multiple sclerosis center.

Scientists have spent decades trying to find out whether viruses play a role in triggering multiple sclerosis. So far, the evidence for a viral cause has fallen short. Still, many researchers suspect that a viral infection could be one of the factors that drive the immune system to mount a misdirected attack on the protective sheath around nerve fibers.

Using the sensitive tests developed by Wong, Bourdette said his team is preparing to screen samples from people with MS to look for human-adapted viruses related to the monkey virus. He said the search shouldn't take longer than 18 months. If such a virus exists -- and it proves to be a triggering factor in multiple sclerosis -- Bourdette said researchers could begin developing a preventive vaccine. The National Institutes of Health funded the research.

Dr. Kenneth L. Tyler, a professor neurology at the University of Colorado Denver who was not involved with the research, said much work remains to establish the role of viruses in multiple sclerosis.

"It is feasible that something similar in humans is occurring, although this study does not prove it," Tyler said. He noted that the researchers have yet to present definitive evidence that the monkey virus is the cause of the MS-like disease. For instance, he said, researchers must show that exposing healthy monkeys to the virus will reliably produce the disease.

But even if the viral connection doesn't pan out, Tyler said the discovery of the MS-like disease in Japanese macaques is significant because it gives researchers a better animal model for testing treatments because it is a naturally occurring disease – not a condition contrived by laboratory manipulation.

"This is a very exciting and interesting animal model," Tyler said.

RABIES FEAR AS UK LAW IS SCRAPPED

Rules on rabies in Britain are ‘outdated'

Friday July 1,2011
http://www.express.co.uk/posts/view/256086...law-is-scrapped

FEARS of a deadly rabies outbreak were sparked last night after plans to scrap Britain’s strict quarantine rules were revealed.

The regulations on animals coming from Europe and other “low-risk” areas will be relaxed.

Pet owners will no longer have to wait six months after vaccination before entry is granted. They will be asked to produce a “pet passport” proving their animal has been micro-chipped and had the anti-rabies jab.

The plans were announced yesterday by Environment Secretary Caroline Spelman, who said it was time to change “outdated” rules.

She said the changes would make it cheaper and easier for people to travel with their pets while putting in place “proportionate” controls to enable the UK to maintain its rabies-free status.

But critics claimed the changes would put the UK at risk of rabies and other animal diseases.

Gerard Batten, Ukip spokesman and MEP for London, said: “We want sensible safeguards that don’t inconvenience pet owners but we can’t rely on a piece of paper to

prevent the possible introduction of rabies to the UK.

We want sensible safeguards that don't inconvenience pet owners but we can't rely on a piece of paper to prevent the possible introduction of rabies to the UK

"EU doesn't necessarily mean low-risk. There is a difference between an animal coming from France and one that has been running around a forest in eastern Europe."

Battersea Dogs & Cats Home expressed concern over the plans, saying it would be "harder to guarantee that the UK could remain rabies-free".Chief executive Claire Horton said: "We are not against the free movement of pets across Europe's borders, but the introduction of the EU pet travel scheme in the UK does give us cause for concern for our frontline staff and volunteers and the wider community."

Under the proposals, domestic animals coming into the UK from the EU and other low-risk areas, including the US and Australia, must be vaccinated 21 days before entry. The current mandatory blood test will be scrapped.

Travellers coming from high-risk areas, including Africa and Asia, will have to prove animals have been vaccinated and blood-tested four months before entry. This differs from the present system which requires all animals from outside the EU to be held in quarantine in the UK for six months.

Experts say modern vaccinations have removed the need for quarantine by giving immunity from rabies after 21 days.

The Department for Environment, Food and Rural Affairs said the risk of the disease entering the UK would increase from one in 13,000 years to one in 211, but it was still "extremely low".

View Full Version: Withheld CDC H274Y H1N1Tamiflu Resistance Sequence

Title: Withheld CDC H274Y H1N1Tamiflu Resistance Sequence

TheUnhivedMind - July 1, 2011 12:36 AM (GMT)

Withheld CDC H274Y H1N1Tamiflu Resistance Sequences

June 30, 2011
http://www.recombinomics.com/News/06301102...C_Withheld.html

The recent comments on detection of multiple neuraminidase resistance markers (S246N with H274Y or I222R) has increased concerns that such markers are more prevalent than reported. This concern was increased by the failure of the CDC to release sequences from recent Delaware H1N1 isolates with H274Y.

Earlier this season the CDC released four 2011 sequences from Delaware and four from Maryland and all eight sequences had H274Y. All eight sequences were collected in February or March and represent the eight most recent isolates from these two states. Phylogenetic analysis indicated H274Y was spreading via recombination and clonal expansion. One of the sequences, A/Maryland/04/2011, was from the Chihuahua sub-clade, while the other seven were from the S188T sub-clade. The first three sequences from Delaware had A189T, signaling clonal expansion. Moreover, the fourth Delaware sequence, A/Delaware/08/2011, was virtually identical to A/Maryland/06/2011, signaling additional clonal expansion. The H274Y was discovered through routine surveillance and was not linked to Tamiflu treatment raising concerns that the detection of H274Y in all eight of the most recent isolates from Delaware or Maryland signaled the start of significant spread of H274Y.

These concerns were increased when Delaware announced ten additional cases with H274Y, as determined by the CDC, supporting significant spread. However, the recently released H1N1 sequences generated by the CDC did not include any of these ten samples or any additional samples from Delaware. Similarly, the recently released sequences did not include any samples from new patients in Maryland. The only Maryland sequence was an egg isolate of Maryland/04/2011 (which also had H274Y).

thus, although all eight of the most recent isolates from Maryland and Delaware, the CDC failed to release any additional 2011 sequences from any new patients, even though Delaware had announced that then CDC had confirmed 10 additional cases.

The withholding of these sequences by the CDC continues to increase pandemic concerns and evidence supporting the fixing of H274Y Tamiflu resistance in pandemic H1N1.

View Full Version: U.N. declares rinderpest wiped out worldwide

Title: U.N. declares rinderpest wiped out worldwide
Description: *[GET READY FOR A SUPER GM RINDERPEST]*

TheUnhivedMind - June 29, 2011 11:15 PM (GMT)

U.N. declares rinderpest wiped out worldwide

Donald G. McNeil Jr., New York Times
Wednesday, June 29, 2011
http://www.sfgate.com/cgi-bin/article.cgi?.../MNM71K3C56.DTL

On Tuesday, in a ceremony in Rome, the United Nations officially declared that, for only the second time in history, a disease has been wiped off the face of the Earth.

The disease is rinderpest.

Everyone has heard of smallpox. Very few have heard of the runner-up.

That's because rinderpest is an epizootic, an animal disease. The name means "cattle plague" in German, and it is a relative of the measles virus that infects cloven-hoofed beasts, including cattle, buffaloes, large antelopes and deer, pigs and warthogs, even giraffes and wildebeests. But rinderpest is hardly irrelevant to humans. It has been blamed for speeding the fall of the Roman Empire, aiding the conquests of Genghis Khan and hindering those of Charlemagne, opening the way for the French and Russian revolutions, and subjugating East Africa to colonization.

Any society dependent on cattle was vulnerable.

The long but little-known campaign to conquer rinderpest is a tribute to the skill and bravery of "big animal" veterinarians, who fought the disease in remote and sometimes war-torn areas - across arid stretches of Africa bigger than Europe, in the Arabian Desert and on the Mongolian steppes.

The victory is also proof that the conquest of smallpox was not just an unrepeatable fluke, a golden medical moment that will never be seen again. The eradication of rinderpest shows what can be done when field commanders combine scientific advances and new tactics.

The modern eradication campaign began in 1945, when the Food and Agriculture Organization was founded. But it became feasible only as vaccines improved. An 1893 version made from the bile of convalescent animals was replaced by vaccines grown in goats and rabbits and finally in laboratory cell lines; a heat-stable version was developed in the 1980s.

How long the ancient battle went on is uncertain. Although cattle die-offs did affect all the historical events mentioned above, there is uncertainty about which were from rinderpest and which were something else, like anthrax.

Death from rinderpest is rapid and nasty. Animals get feverish; their eyes and noses run. Their digestive tracts are inflamed from mouth to anus, and they die of diarrhea and protein loss.

But other diseases have overlapping symptoms, and a rapid diagnostic test that could be used next to a dying animal was not developed until the 1990s.

Some experts believe the disease arose in the gray oxen of the Central Asian steppes and was swept forward in the trains of baggage and beasts that followed the Mongol armies in the 1200s as they conquered Eurasia from China to Poland. With the exception of a brief, contained outbreak in Brazil in 1920, it did not reach the Americas. A crucial advance was a new vaccine that survived a month without refrigeration. That let herders who could be recruited do their own vaccinating. An education campaign using comic books, flip charts and lecturers who spoke local languages was begun.

The whole campaign, from 1945 to the present, cost about $5 billion, the United Nations has estimated.

"At first I thought, that's quite a lot," said Dr. Peter Roeder, who directed the final eradication drive after working on the two earlier ones. "Then I thought, that last royal wedding cost $8 billion. This was cheap."

View Full Version: WHO Inconsistent Comments on Japan H274Y Tamiflu

Title: WHO Inconsistent Comments on Japan H274Y Tamiflu
Description: *Resistance*

TheUnhivedMind - June 20, 2011 01:53 AM (GMT)

WHO Inconsistent Comments on Japan H274Y Tamiflu Resistance

June 19, 2011
http://www.recombinomics.com/News/06191102..._Japan_WHO.html

Based on available data, among Japanese oseltamivir resistant viruses, the vast majority were from cases treated or prophylaxed with oseltamivir.

The above comments from the latest WHO report on oseltamivir (Tamiflu) resiistance in H1N1 implies that the increasing frequency of Tamiflu resistance (H274Y) reported in Japan is due to Tamiflu treatment, but the latest sequences released by Japan's National Institute on Infectious Diseases (NIID) indicate H274Y increases are due to community clonal expansion across the entire country.

NIID has recently released 43 NA sequences collected between Dec 2, 2010 and Feb 2, 2011. 13 of these sequences (largely from Jan collections) had H274Y and this high frequency (30.2%) may be markedly above the reported 1.5% due to selection of samples for sequencing, but the published sequences clearly demonstrate clonal expansion because 10 of the 13 sequences are virtually identical to each other and form a phylogenetic branch which is exclusively populated by isolates with H274Y, Moreover, as seen by the list (below) of these 10 isolates, they are from eight different prefectures, indicating the community clonal expansion has spread throughout the country. This spread is supported by the spike in the detection frequency (to 4.8% in Feb and 5.8% in Mar), which would again be linked to clonal expansion and not linked to Tamiflu treatment (Table 1):

Thus, the basis for the WHO statement remains unclear. WHO consultants have agreed to report mixtures containing resistant sequences as wild type if the level of H274Y is below 50%, and therefore collection of samples after treatment may increase the level to more than 50%, leading to a resistance (H274Y) positive report. However, the virtual identity of the sequences from the 10 isolates below indicates the spread is via clonal expansion and not “spontaneous” mutations selected by Tamiflu treatment, as implied in the WHO statement above. Similarly, the wording of the WHO statement leaves open the possibility the patients were treated with Tamiflu after collection of the sample (which is common), and the classification of such patients as "Tamiflu treated" just adds to the confusion created by the “agreement” by consultants to not report Tamiflu resistance in samples where H274Y is below 50%.

In either case, the comments by WHO are grossly misleading and are little more than propaganda masquerading as science, creating the illusion that the increasing frequency of H274Y in community cases is linked to spontaneous mutations selected by Tamiflu use, rather than clonal expansion of a dominant sub-clade with H274Y.

A WHO explanation of these misleading reports is long overdue.

Closely related H274Y positive sequences:

View Full Version: Plague Could Worsen With Climate Change

Title: Plague Could Worsen With Climate Change
Description: *[AND BACKGROUND RADIATION!]*

TheUnhivedMind - June 16, 2011 05:48 PM (GMT)

Plague Could Worsen With Climate Change

The Huffington Post Dean Praetorius
First Posted: 06/14/11
http://www.huffingtonpost.com/2011/06/14/p...e_n_876803.html

It seems the wetter things are the more plague there will be.

A new study, conducted by Chinese and Norwegian scientists, seems to suggest a connection between wetter climates and larger outbreaks of plague, according to LiveScience. As a result, as climates become wetter, the more likely it is that plague can spread.

Luckily, the bacteria that causes plague can be treated with antibiotics.

From LiveScience:
A bacterium called Yersinia pestis, which is carried by rodents, is responsible for three types of plague: bubonic (also called Black Death), septicemic and pneumonic plague. Together, these illnesses have been responsible for the deaths of millions of people the world over, including an estimated third of Europe's population during the Middle Ages. While modern antibiotics can effectively treat plague, thousands of cases are still reported each year to the World Health Organization, and the bacterium has been identified as a possible biological warfare agent.

The study looked at historical data to determine a correlation between the amount of precipitation and the spread of the disease. The team looked at figures from outbreaks in 1850 and 1964, when 1.6 million people became ill, as well as 500 years of data from 120 locations across China.

This study falls pretty much in line with previous studies that contended that climate change would lead to decreased plague outbreaks in drier areas, according to Reuters. In September 2008 a study said that as climate change created drier climates in the Western U.S., reported cases of the disease were expected to decrease.

Results of the latest study were published last week in the Proceedings of the National Academy of Sciences.

View Full Version: S246N and H274Y Tamiflu Resistance In Fatal

Title: S246N and H274Y Tamiflu Resistance In Fatal
Description: *Australian Case*

TheUnhivedMind - June 13, 2011 03:40 AM (GMT)

S246N and H274Y Tamiflu Resistance In Fatal Australian Case

Recombinomics Commentary 19:30
June 12, 2011

In Perth, Western Australia, an immunocompromised patient was found on 1 March 2011 to be infected with an influenza virus that contained the S247N NA mutation (A/Perth/30/2011) (Table). Oseltamivir treatment was commenced two days after detecting the initial S247N variant (3 March). A sputum specimen collected five days later (8 March) contained an influenza virus with both the S247N and H275Y NA mutations (A/Perth/29/2011) (Table). Despite commencement of intravenous zanamivir the patient died on 16 March from multiple organ failure. The isolate with the dual S247N and H275Y mutations had an oseltamivir IC50 nearly 6,000-fold higher than sensitive viruses and 10-fold higher than seen for influenza A(H1N1)2009 viruses with the H275Y mutation alone (Table).

The above comments from the recent Eurosurveillance rapid communication on “moderate” oseltamivir (Tamiflu) resistance due to S246N describe detection of H274Y in a sample collected five days after the start of oseltamivir treatment. The rapid appearance of H274Y strongly suggests that the polymorphism was circulating in the patient prior to treatment (although it was not present in the published sequence, A/Perth/30/2011, collected prior to treatment), and the moderate resistance (six fold), linked to S246N significantly facilitated the increase in H274Y (present in the later collection, A/Perth/29/2011), which was reported in the absence of a wild type signal at position 274.

The appearance of H274Y in patients treated sub-optimally was not unexpected. Treatment of children in Japan with sub-optimal dosing of oseltamivir was linked to the

appearance of resistance at multiple positions, and clusters of H274Y have been reported in immunocompromised patients treated with Tamiflu.

Increased monitoring of immunocompromised patients is common and the increase in resistance can have clinical consequences, including death, as seen in the above patient.

The level of H274Y in circulation is under-reported because WHO collaborating groups have agreed not to publicly report H274Y levels below 50%. The resistance is reported to physicians, because as seen above, the frequency increases quickly and significantly after the start of treatment, and as indicated by the IC50 value reported above, the treatment is useless.

The recent report of efficient transmission of S246N in Singapore and Australia raises concerns that associated increases in the levels of H274Y will become increasingly common.

Release of data on H1N1 samples with H274Y levels below 50% would be useful.

The WHO agreement to withhold this data continues to be hazardous to the world's health.

Title: Potentially fatal infection strikes Joplin tornado
Description: *victims*

TheUnhivedMind - June 10, 2011 09:28 PM (GMT)

Potentially fatal infection strikes Joplin tornado victims

Flying debris from the tornado that tore through Joplin, Missouri, has sparked an outbreak of a potentially fatal infection.

1:41AM BST 10 Jun 2011
http://www.telegraph.co.uk/news/worldnews/...do-victims.html

The rare but serious – and in some cases deadly – fungal infection has affected some of the more than 900 people injured in the disaster.

Soil or plant matter on debris that penetrated the skin of some of the people who survived is believed to have caused them to contract an infection called zygomycosis, said Uwe Schmidt, an infectious diseases physician at Freeman Health System in Joplin.

Mr Schmidt said he knows of at least nine patients who have had the infection in the weeks since the disaster.

Three or four of them died and he said zygomycosis was a factor, if not the actual cause.

"It's definitely quite striking," Mr Schmidt said.

"To have so many cases of this is rather rare."

He said he had previously only seen two cases of zygomycosis in his career.

The May 22 tornado cut a six-mile swath through Joplin, killing 151 people while

destroying some 6,000 homes and many other buildings.

Several people have been treated for zygomycosis in neighbouring Greene County, said Kendra Williams, administrator of community health and epidemiology for the Springfield-Greene County Health Department.

"It's just an unfortunate side effect of the tornado," Ms Williams said.

"You deal with the sadness and emotions from the tornado itself and then you find there are problems associated with this."

Symptoms of pain, swelling and skin discolouration typically showed up about five to 10 days after the tornado.

But depending on a person's age, health and wounds suffered, some cases could still surface.

The infection can spread rapidly and invades the blood supply.

Treatment is with intravenous anti-fungal mediation and removal of damaged skin tissue. Mold can be seen in some of the wounds, Mr Schmidt explained.

Public health departments in the Joplin region have notified doctors and hospitals to be aware of the possible infection when treating patients injured in the tornado.

Swine Flu Variation Emerges With Power to Resist Drugs, Researchers Say

By Michelle Fay Cortez - Jun 9, 2011
http://www.bloomberg.com/news/2011-06-09/s...rchers-say.html

A novel form of the swine flu virus that swept the globe in 2009 has emerged in Australia and Singapore, carrying a genetic twist that helps it resist Roche Holding AG (ROG)'s Tamiflu and GlaxoSmithKline Plc (GSK)'s Relenza, researchers said.

More than 10 percent of the infections in Singapore and 30 percent of those in northern Australia tested in early 2011 had mildly reduced sensitivity to the two drugs that are the mainstay of influenza treatment, according to a report today from the World Health Organization's influenza research group in North Melbourne, Australia. BioCryst Pharmaceuticals Inc. (BCRX)'s experimental flu drug peramivir remained an effective treatment against the virus in laboratory tests, the researchers said.

The new variation of H1N1 mixed with an older form of the virus in at least one patient, the researchers said. The infection was extremely resistant to Tamiflu and the individual, who had a weakened immune system, died of multiple organ failure. With other flu strains circulating in the U.K. and elsewhere, there is a risk of future combinations of drug- resistant virus, they said.

The new variation appears to spread easily among people, according to the report in the journal Eurosurveillance. If it circulates widely, researchers said they are concerned that other mutations may occur and trigger even greater drug resistance and more serious illness.

Influenza is a rapidly evolving virus, and the severity of the season depends on which

strains are circulating and how well a population has been inoculated. Annual deaths in the U.S. associated with seasonal flu ranged from 3,349 to 48,614 from 1976 to 2007, according to the Centers for Disease Control and Prevention. About 90 percent of flu-related deaths are in people ages 65 or older.

The H1N1 virus was reported in more than 214 countries and caused about 18,450 deaths worldwide through August when the World Health Organization declared an end to the pandemic.

Title: Half of UK population had swine flu during pandemi
Description: *and many didn't even realise it*

TheUnhivedMind - June 10, 2011 02:15 AM (GMT)

Half of UK population had swine flu during pandemic... and many didn't even REALISE it

By Fiona Macrae
Last updated at 12:27 PM on 9th June 2011
http://www.dailymail.co.uk/news/article-20...realise-it.html

Almost half of the population caught swine flu during the pandemic – although many didn't realise it, research shows.

Blood taken from 1,600 Britons after the 2009/10 H1N1 outbreak revealed that 44 per cent tested positive for the virus.

While some of these had been vaccinated or had caught a similar infection many years earlier, most had caught swine flu, say the Edinburgh University researchers.

Extrapolated across the country, this means that 20 times more people had swine flu than previously thought – even if it was so mild that many didn't realise it.

However, this doesn't mean that the outbreak, which killed almost 500 Britons when it first struck, was not serious.

Professor Mark Woolhouse, of the University's Centre for Infectious Diseases, said: 'This flu spread very quickly.

'There were about 20 times as many people found to have contracted the disease, as we first thought, which was surprising.

Many people didn't even know they had the disease

‘It’s true that many cases were mild but it does not change the number of people who died from the disease or who were in hospital.’

People living in the most deprived areas were almost twice as likely to have caught the bug, the journal PLoS ONE reports.

The professor said: ‘It was pretty unexpected. I’m merely speculating here but I imagine it’s to do with the size of the household being smaller, making viruses more likely to spread.’

The study of the antibodies in blood samples taken from people living in Glasgow and the west of Scotland, also revealed that millions of doses of vaccines may have been wasted

This is because the study revealed that almost half of those given the jab had already been infected and so were immune to the disease.

Professor Woolhouse said: ‘Vaccinating them didn’t do them any harm but for public health authorities that need to vaccinate people as quickly and effectively as possible, because stocks are limited and time is short, this is a wasted effort.’

He said that testing for antibodies during future outbreaks of flu or other infections could help better track the disease and help doctors decide who to vaccinate.

Researchers found that there were about 20 times as many people with the disease than first thought

But Professor John Oxford, Britain’s leading flu expert, questioned whether this would be practical.

He said: ‘It is an interesting idea but the vaccine costs £5, whereas testing someone for antibodies would cost three or four times that, so the total cost would far exceed vaccination.

‘And I don’t think people would be too enthusiastic to line up and give blood to see if they needed a vaccine.’

Professor Oxford added that people shouldn’t let the high rate of spread of the virus stop them from being vaccinated against flu in the future.

He said: ‘Half of population hasn’t had it and that means that half of the population is vulnerable and the virus could still come and get them.’

Swine flu claimed around 600 lives when it returned this winter and is expected to

return alongside ‘normal’ seasonal flu viruses in years to come.

TheUnhivedMind - June 9, 2011 04:35 PM (GMT)

Novel Electromagnetic Disease Induction and Its Weaponization

To (Correspondent).
Feb. 14, 2001
http://www.cheniere.org/correspondence/021401.htm

Yes, the Kaznacheyev experiments were quite real; 15,000 or so in military research institutes in Siberia. As with so many other novel areas investigated and developed by the Soviets, most U.S. investigators just assumed normal EM, which is not what the Kaznacheyev experiments involved, and not what was carrying disease induction patterns from one cell culture to another in rigorous lab tests. With the Evans-Vigier O (3) electrodynamics as a very important subset of Sachs' unified field theory, rather than the conventional U(1), what Kaznacheyev used and how it worked can be rigorously modeled, shown, and proven. Unfortunately no one seems to be trying to do that. The favorite phrase lo these decades is "we have no evidence that..." Almost everybody is using U(1), which erroneously assumes a flat spacetime in which the EM energy moves. In GR it is well-known that any change of spatial energy density is a priori a curvature of spacetime, and that an EM wave is an oscillating change of spatial energy density, hence an oscillating curvature of spacetime. So the EM wave does propagate in curved spacetime; in fact it identically is "curvature of spacetime" dynamics that is propagating. The old Maxwell-Heaviside theory is a material fluid flow theory done before SR and GR even existed, still assuming a material ether, using the effect wave after interaction with charge, as the causal field in spacetime before that interaction, and the scientific community simply has not corrected several dozen major errors in the old theory. So our analysts who use it, are using 136 year old obsolescent models, while facing an enemy who exerted the greatest effort in history to update and correct that science shortly after WW II. It is not difficult to find evidence of that effort in

the open literature.

Kaznacheyev's work -- and its real unified field theory investigation and modeling, using the "infolded" longitudinal EM wave electrodynamics which carry the specific spacetime curvature engines for the given disease engines -- formed the basis for the decades-long microwave radiation of the U.S. Embassy in Moscow. Many health changes in personnel were induced at the Embassy, and the radiation also caused the deaths of three U.S. ambassadors. By our actions at the Embassy (or lack of appropriate actions) over several decades, we showed the Russians we had not the slightest notion of what they were really doing. E.g., putting up aluminum screens on the windows got 90% of the fields, and reduced the field-free potentials not one whit. By targeting a high level U. S. target -- the U.S. ambassador -- all the "alphabet soup" such as CIA, DIA, NSA, etc. got involved, as did high officials. The resulting U.S. study of that "microwave radiation" and the health changes at the Embassy thus revealed -- with 100% certainty -- whether or not we knew about engines, disease induction via the infolded electrodynamics inside fields, waves, and potentials, etc. We showed that our scientific community and intelligence community were still entranced with the 136-year old flawed Maxwell-Heaviside electrodynamics. In short, in terms of our knowledge of advanced electrodynamics we showed them we had "bows and arrows", so to speak, instead of nuclear weapons. It was a beautiful intelligence collection and analysis tool, and it worked beautifully. We remind the reader that the first detection of such "radiation" of high U.S. officials occurred in the radiation of Nixon when he visited the Soviet Union. That radiation was detected on an ionizing detector, which the security party carried because Nixon was visiting some nuclear power facilities. We also point out that such detectors do not necessarily detect nuclear radiation, but detect anything that will ionize their internal mechanisms (in the case of the Geiger tube, their internal gas). Longitudinal EM waves will do that, as will a longitudinal EM wave interferometer. No one in the U.S. recognized the peculiar nature of that radiation.

The Kaznacheyev "disease induction by novel electrodynamics" work is also the basis for the spacetime curvature engines (not EM signals!) carried by quantum potential EM biological weapons for distant induction of diseases etc. into the population of an entire nation or area, such as the U.S. This quantum potential disease induction weapon -- capable of attacking an entire population of a nation or area -- has been tested several times in the U.S. at very low levels, in the shadow state only (we explain shortly) and it has a most peculiar signature. E.g., one test used necrotizing fasciitis (flesh-rotting disease) engines. The disease "engine" was deliberately kept down in the "shadow state" (virtual state, just below the observable state) so that only a tiny bit of the populace with depressed thresholds would "breach the observable threshold" due to the population forming a bell-shaped curve as to the threshold level. The major signature of the test was that the cases of the disease broke out totally statistically and randomly, spread all over, without any "disease vector" in between. In short, it was not spread in any manner required by normal deterministic disease vectoring, but was a totally

random set of occurrences. Several other diseases were also tested this way in the American populace, with precisely the same signature.

The major use of this QP disease-induction weapon will be to slyly "augment" the effectiveness of biological warfare strikes against the United States by terrorists either wittingly or unwittingly acting as protégées. Such attacks eventually will be made in and against the populace of the United States, causing mass casualties. By impressing the same disease vector engine -- for the specific BW pathogens used by the terrorists in their attacks -- in the populace residing in the struck population center, and bringing that "resident engine state" in the affected body potentials to the "shadow state" just shy of the populace significantly breaking out with the disease, then the real biological pathogens for that disease -- when unleashed by the terrorists -- will have greatly augmented effectiveness. It is one "asymmetrical way" to guarantee the sudden and rather complete destruction of a nation, without that nation even being aware of what was done to it. It is a vast amplification of the "conventional" biological warfare techniques and strikes. The targeted nation's analysts will think it was just the terrorists' BW attacks that did the nation in. In short, the KGB is grimly smiling all the way to the strategic warfare bank on this one. We're sitting ducks for it, have proven to them for 50 years that we are sitting ducks for it, and by using obsolescent electrodynamics and analyses our scientists and intel community continue to assure that we shall remain sitting ducks. They do not intend to do so, one understands, but that is the actual effect, unintended or not. In warfare it is the bottom line that counts, not misguided intentions.

As an example, in the standard Congressional OTA study, a professional anthrax attack on Washington, D.C. -- 100 Kg. sprayed from a light aircraft on a calm night -- would yield 1 to 3 million casualties. If augmented by QP shadow state preparation for anthrax, the effectiveness will be multiplied about fivefold. In short, the attack would then produce some 5 to 15 million casualties. Also, the symptoms and the disease progress faster than in the standard scenario because the body's defenses are overwhelmed at a much more rapid pace when the pathogenic disease induction starts with the disease already present in the infected persons in the shadow state.

These figures assume "spreading" of the targeted immune systems by the QP weapon. In short, the way one really does in the immune systems of the targeted populace, is to use the QP weapon to induce at the shadow state level a cocktail mix of disease engines. Say, for about 10 different diseases. The cellular control system, immune system, and cellular regenerative systems do use the "infolded" electrodynamics, and so they do react to the "shadow state" disease almost as if it were a real disease, and initiate preparations for fighting that disease. In short, the immune system vigorously prepares to fight its perceived invaders, e.g. But the immune system is also a finite system; it only has so many resources. Usually in the ordinary world it can focus most of its resources on just one major invader at a time, for usually it only gets one really massive "infection" invasion at a time. But if it has to prepare for 10 or more invaders simultaneously, it is forced to very thinly spread its resources across all of them. This

means that its ability to fight off any one real pathogen invader from the cocktail group, is dramatically lessened. Effectively, the immune system has been greatly "suppressed" in its ability to do its job, but in a most peculiar way that is not in the medical textbooks.

Such quantum potential pre-preparation and "spreading of the targeted immune systems" gives about a five-fold increase in biological strike effectiveness. Indeed, if the number of diseases in the cocktail mix is increased, the effectiveness can be increased by a factor of 10 rather than 5. And this is precisely what is planned to be used against our major population centers. We may be facing mass casualties on an unheard of scale. Our very poor counter BW defenses will be immediately and massively overwhelmed, and our major response will be triage, not treatment. Effectively, we will just have to drag most of the stricken and suffering casualties aside, to die very agonizingly.

Apparently one planned use of such an augmented clandestine BW weapon will be smallpox, e.g. As you know, the Russians did develop smallpox for biological warfare, and even developed a new strain against which previous vaccination is ineffective. With the collapse of the Russian economy, most of the scientists from those BW labs all quietly went to work elsewhere in the world, at lucrative jobs, developing such BW weapons. Check several of Laurie Garrett's books and papers (cited) for the truth about what was developed in those laboratories. Many of those BW scientists went to work for nations which are quite hostile to the U.S. As an example, any prudent analyst would have to give Saddam Hussein the capability to have not only anthrax but smallpox BW agent already in this country, along with the necessary terrorist teams. We know there are many nuclear weapons already hidden in our population centers; simply read Lunev's book and he tells you how the Russians used to bring them in, and quite easily. The clandestine nuclear weapons are already on site, as are the Spetznaz, and waiting for the word to move and blow up our population centers.

For the BW aspects of a smallpox attack, check Laurie Garrett, "The Nightmare of Bioterrorism," Foreign Affairs, 80(1), Jan./Feb. 2001, p. 77. Quoting: "Were a terrorist to disperse the smallpox virus, for example, populations that were once universally vaccinated would now be horribly vulnerable. Today the U.S. government stows only about 15.4 million doses of the smallpox vaccine-enough for less than seven percent of the American population. The World Health Organization (WHO) keeps another 500,000 doses in the Netherlands, and other national stockpiles total about 60 million more doses of varying quality and potency. If the smallpox virus were released today, the majority of the world's population would be defenseless, and given the virus' 30 percent kill rate, nearly two billion people would die."

Garrett also goes on to reveal that most of the American vaccine stocks are contaminated and the vial seals failed, so they are unfit to even use in humans. Further, once the strike is made, vaccines are useless because by the time they could develop immunity (assuming the old strain is used in the attack), you are already dead,

particularly with the enhancement of immune system spreading and thinning.

The vast numbers of expected casualties, coupled with immune system spreading, are absolutely irresistible to the Russian mind. You can count on it that they have seen that the smallpox is already on site here, in the U.S. and in the hands of professional terrorist teams. Of course, the Russians/KGB will protest they have nothing to do with that! Yet likely the KGB will have flatly arranged it or at least assisted it. The capability for mass destruction of the nation is so lucrative and easy to achieve in advance, that they would never be able to resist doing it.

With QP "cocktail mix" augmentation, in the targeted populace the 30 percent kill rate for smallpox will increase to perhaps 90 percent. Also, the progress of the disease in infected persons is likely to be much faster than would be otherwise experienced. In short, a determined enemy with professionally trained and pre-inserted BW pathogens and terrorist agents can simply wipe out a targeted nation with the combined technology. The struck nation is also wiped out very rapidly, since the smallpox development in a populace with "spread" immune systems is unprecedented.

It appears that this is one of the planned attacks the KGB will use -- and has already put in place and readied -- to destroy the United States by "asymmetrical means" (a favorite oblique phrase of high Russian officials), and in this case taking full advantage of terrorist strikes by enthusiastic protégées who will do the dirty work and take the blame as well as any U.S. retaliation. Indeed, it would appear that this is one of the major planned strategic attacks to be launched on the U.S. in the not too distant future. We note the coalescing and meeting of significant world terrorist groups and organizations as we write this response.

Notice how such an attack takes advantage of known testing by the KGB/Russians, and how it appeals to the "chess-player" mentality of the KGB and the Russian national psychology (in formal strategic analysis, how it corresponds to the Russian "National Style".). It's devious, deadly, deeply hidden, rises up suddenly and snaps its prey and the game is rather suddenly all over. The targeted adversary never even sees what is coming, has no inkling of "spreading", does not have QP weapons or QP weapon experience, never recognizes who really hit him, etc. Any desperate retaliation will be taken against the protégées, who will be gleefully claiming credit for these strikes on the "Great Satan" or other such phrase. That's exactly the situation we are now in. Essentially little or none of our present counter BW preparation is going to do very much at all for us. It was already largely defeated, even as it was being conceived on the drawing board, much less after being deployed.

The first test of a Russian QP weapon against the U.S. was apparently against the U.S. air attack on Libya in April 1986, using a laboratory prototype device. That was a simple test just to jam electronics in the aircraft control systems and in the missiles, and for deception planning it was using the fact -- at the time -- that we had indeed been lax on

ECM hardening of our electronics systems, to save money. The attack worked well and demonstrated we did not even recognize the type of weaponry used against us, and to this day our fellows have never figured out what really hit us. They used ordinary U(1) electrodynamics in all their analyses, so simply contributed it to ordinary ECM jamming, etc. In short, the Russian deception plan was also highly successful.

The operational deployment of full-scale strategic QP weapons on site in Russia occurred at the end of 1989, which is when the formal weapons first went operational. These weapons are not in the inventory of the regular Russian armed forces, but all research and development, manufacturing, deployment, and manning and employment is under the ruthless control of the KGB. Shortly thereafter (within weeks), the KGB leased many of their earlier longitudinal EM wave interferometer (LWI) weapons to a rogue Japanese group comprised of the Aum Shinrikyo and Yakuza. Senator Nunn's investigation of mass destruction weapons confirms that the Aum Shinrikyo went to Russia and set up a university, but they missed the involvement of the Yakuza. The Aum Shinrikyo set up the university in Moscow where the Russians/KGB taught the rogue Japanese crews the necessary technical longitudinal EM and the technical operations of those interferometer weapons. Those are the LWI weapons which were operationally deployed first in 1963 and used to kill the U.S.S. Thresher off the U.S. East Coast with ridiculous ease in April 1963. They are also apparently the weapons which former Secretary of Defense Cohen alluded to in April 1997. Quoting:

"Others [terrorists] are engaging even in an eco-type of terrorism whereby they can alter the climate, set off earthquakes, volcanoes remotely through the use of electromagnetic waves... So there are plenty of ingenious minds out there that are at work finding ways in which they can wreak terror upon other nations...It's real, and that's the reason why we have to intensify our [counterterrorism] efforts." [Secretary of Defense William Cohen at an April 1997 counterterrorism conference sponsored by former Senator Sam Nunn. Quoted from DoD News Briefing, Secretary of Defense William S. Cohen, Q&A at the Conference on Terrorism, Weapons of Mass Destruction, and U.S. Strategy, University of Georgia, Athens, Apr. 28, 1997.].

Note that the SecDef did not speak the words placed in square brackets. These were apparently inserted later to "tone down" the Secretary's remarks. Our news media, entranced at the Clinton scandals, did not even react to the confirmation by Secretary Cohen that parties were using novel EM weapons to engineer the climate and weather, initiate earthquakes, and stimulate sleeping volcanoes into violent eruption!

These kinds of weapons are the real strategic threats shaping up against us. Meanwhile, our strategic analysts have largely not yet even gotten out of the decrepit 136-year old U(1) electrodynamics. We don't even have biological masks for the populace, or even for all our emergency personnel. There are no biologically safe mass shelters. We have no effective methods of treatment in most cases; normal vaccines, medicines, etc. essentially fail. Yes, we have harsh chemical sprays that will kill the

anthrax, e.g., and perhaps some of the smallpox. But that is a spit in the ocean to a population whose immune systems have been spread, and millions of them are already sickened and dying.

We tried very hard in 1998 to call attention to the extreme national need for the most urgent possible development of a portable computer-controlled treatment device based on the experimentally proven Prioré methodology, but extended to a much simpler and far more rapid method of treatment. Quick development of this technology could lead to a suitcase size device, capable of treating a patient in less than one minute, and stopping the symptoms and disease progress cold, then reversing it. Three "less than a minute" treatments one week apart would be required for complete cure. As an added advantage, partial reversal of aging in older patients would also be accomplished as a bonus, in addition to time-reversing the damaged and diseased cells.

The basis is a method for "time-charging" the body with a specific set of spacetime curvatures that precisely reverse the previous cellular changes in the infection and course of the disease. The time-polarized photon, and hence the time-polarized EM wave, already exist in quantum field theory, our most modern theory. But none of our fellows even know how to make a time-polarized wave. I published how to make one, and used that as the basis for solving the most pressing problem in electrodynamics: the problem of the source charge and its associated vast fields and potentials and their vast energy. U(1) fellows have not the slightest notion of using time-polarized EM waves to pump the cells of the body in the time domain. They have no notion that -- since time is multiply connected --pumping the body in the time domain simultaneously pumps everything in the body, down to even the quarks and gluons inside the nucleons. Everything in that body exists at each and every point in time; there is no "outside to inside" propagation through 3-space necessary when time-wave pumping is used. One "starts at and in the entire inside". Also see some of the AIAS published papers on time-like EM longitudinal waves and energy currents..

The method proposed to the DoD in 1998 used normal EM in a peculiar way to force the body itself to make its own time-polarized EM waves, and pump every part of its cells -- including the genetics -- in the time domain. According to general relativity (and O(3) EM, which is an important subset of Sachs' unified field theory and thus capable of operating in both the time and space domains), the exact condition and dynamics of every cell and every part of every cell are resident in that cell and in every smallest part of it, as a set of spacetime curvatures. Misner, Thorne, and Wheeler, Gravitation, assure us that any set of spacetime curvatures will act upon any mass therein, at every part of that mass, and "from inside out" since it arises from everywhere inside the exposed mass. The time-domain pumping creates an amplified "antiengine" that is precise for each cell (i.e., for its "resident time-forward engine" and every part of it). This amplified anti-engine overpowers the "forward time" resident engine at any and all levels, and therefore reverses the entire cell -- and all the cells of the body --back to a previous healthy state.

Becker already proved that weak EM potentials -- which are sets of both time-domain EM longitudinal waves and 3-space EM longitudinal waves -- placed across a bone fracture site will cause rather dramatic time-reversal and time-forwarding (elimination of forward-time deltas!!!), including changing the entering red blood cells into earlier form (dedifferentiation), then into the form that makes cartilage (redifferentiation), then into the form that makes bone (redifferentiation again), depositing these latter into the fracture site to form new bone and heal the fracture.

Becker was nominated for a Nobel Prize several times for his epochal work. The mechanism for those changes had not been previously explained, until I succeeded in breaking that mechanism after 14 years hard work. The point is, it's experimentally proven. It is not conjecture. It is real. One can indeed time-reverse cells in vivo. That is in fact how the human cellular regenerative system heals damaged cells, within its capability to pump weakly in the time domain.

But our scientific community is far from considering anything like that, even though Becker's work was done in the 60s. Our EM science is still archaic, compared to the technology really loose in the world and to be employed against us. It is common for radar engineers and ordinary electrical engineers, e.g., to perform some of the most critical electrodynamics analyses in our intel institutes. These fellows may be good at radar and electrical engineering, but they know absolutely nothing at all about Russian energetics, time-polarized EM waves, extension of nonlinear phase conjugate optics to pumping in the time domain, the "portholes concept" by which the body itself can be forced to generate its own specific time-domain EM pumping to generate those highly specific amplified antiengines, etc. The minimum base knowledge required is a good working knowledge of O(3) electrodynamics, phase conjugate optics, and general relativity, and then one must be aware of the specific extensions. I doubt that we have ever had a single major analyst so qualified, in any intelligence agency in the U.S. If we have had, it has been exceedingly few, say not more than two or three. We have not even incorporated (until perhaps a few years ago) Whittaker's 1903 and 1904 papers showing the internal, hidden electrodynamics. And much of our physics, believe it or not, actually uses the effect as the cause, thus completely getting the cart before the horse. It's rather like the proverbial Oozlefinch (check out with Fort Bliss, Texas what an Oozlefinch is), which flies backward so it can see where it's been. The use of the effect as the cause is a complex subject; see my website discussion of it in my "Engines and Templates" paper, www.cheniere.org.

Most Americans think we won the cold war, and that it's all over. To the contrary, we are in the most deadly danger in our entire history. And we are way behind, and losing. Here we are speaking of just one "asymmetrical" means arrayed against us. Unfortunately there are many others also, equally or even more grisly and bizarre.

In today's world, a nation wins or loses the next major war precisely by its scientific

insight and its preparations beforehand. Our insight and preparations beforehand are not even in the right domain.

Quite simply, we are going to be struck this way (QP spreading the immune systems of the populace plus professional smallpox, anthrax, etc. BW attacks on our population centers) and by other means we've spoken of in other papers and briefings.

But let us just stick to this one major threat, and the strike that will occur. As it stands right now, we're going to lose it. Fast. In less than two hours. We won't even know the Russians are involved, as the protégées will be doing the striking and probably openly boasting about it and "taking credit". Let us say that Saddam Hussein does this strike, and uses anthrax and smallpox. And we then nuke Iraq off the face of the earth, while millions are dying. Big deal. We still die, and we lose. If there are no defenses developed against this, then we really do have an "assured destruction" situation -- ours. We do not have a "mutual assured destruction" capability, because we will not even know who the clandestine "mutual" adversary really is.

We mostly still have the same scientific analysts, still thinking the same old ways, who couldn't draw a correct statistical conclusion in the decades-long "microwave radiation" of the U.S. Embassy in Moscow. Or who could not understand the induction of the Gulf War Disease by QP weapon means, as a preliminary test and also as a stimulus of our government and intel agencies to see if they knew what was going on. We clearly showed them we had not the foggiest notion of what they were really doing and how they were doing it.

In the Moscow Embassy radiation, the Johns Hopkins signals distribution study showed clearly that the health changes occurred only in personnel located in field-free areas. In short, in areas where the potentials had no gradients, and so where the potentials and their hidden internal "engines" were therefore perfectly stable. But because of U.S. scientific adherence to the 136-year old Maxwell-Heaviside U(1) theory, and the archaic belief that only the force fields cause anything, our scientists ignored the 100% correlation against the fields and 100% correlation to the field-free potentials. They incorrectly stated that the microwave radiation could not be the radiation because "no EM fields were present where the effects occurred." That's like saying that a bullet-riddled body -- slain in old Mafia fashion -- could not have been caused by those machineguns over yonder, because there were no machineguns in the direct vicinity of the body.

That conclusion was and is wrong, and it violates simple statistical inference techniques. They did not even consider the potentials, much less the field-free potentials and their adjusted Whittaker internal structures. The illogical "conclusion" of the study of the U.S. Embassy radiation is a serious indication of just how noninformed our scientific community and our intelligence community have been with respect to (1) higher symmetry electrodynamics, particularly as a component of a unified field theory,

and (2) the infolded "hidden variable" electrodynamics -- and thus "engines" -- inside of and comprising all "normal" EM potentials, waves, and fields. We desperately need them to do better than that.

So yes, EM induction of disease did develop dramatically from the Kaznacheyev work.

And we're quite likely to find out before long now, just how far it really did develop.

Sincerely,

Tom Bearden

Dmitriyev, V. P., "The substratum origin of relativistic effects," Galilean Electrodynamics, 4(1), Jan.-Feb. 1993. establishes an "inner structure of space" thesis, although he does not speak yet of engineering it electromagnetically. He points out that, as is well known, general relativity theory (GRT) is known to be a subalgebra of the nonlinear theory of elasticity (NTE). On that basis alone, GRT is incomplete. At least, it does not include the remaining subalgebras of the full NTE, which is already known to

be correct. Further, Dmitriyev shows that GRT arises naturally from the substratum interactions.

With respect to O(3): In 1992 it was shown (Physica B, 192, 227, 237 (1992)) that there exists a longitudinal component of free space electromagnetism, a component which is phaseless and propagates with the transverse components. Later this was developed into a Yang-Mills theory of electromagnetism with O(3) Lagrangian symmetry. This theory is homomorphic with Barrett's SU(2) electrodynamics and has far reaching implications in field theory in general. Recently it has been recognized to be a sub theory of the Sachs theory of electromagnetism, based on the irreducible representations of the Einstein group of general relativity. The Sachs theory produces a non-Abelian structure for the electromagnetic field tensor. The O(3) electromagnetism also has implications for the potential ability of extracting energy from the vacuum, and its topological implications are currently being investigated by Ranada. The O(3) electromagnetism has been tested extensively against empirical data, and succeeds in describing interferometric effects and physical optical effects where the conventional Maxwell Heaviside theory

fails. Implicit in both the O(3) and Sachs theories of electromagnetism is the ability to extract electromagnetic energy from curved space-time.

Sachs, Mendel, General Relativity and Matter, Reidel, 1982. Provides a great generalization of general relativity and electrodynamics reaching from the quarks and gluons to the entire universe.

VIRUS KILLS ROYAL SWANS

A virus has wiped out more than 180 of the Queen's swans

Wednesday June 8,2011
http://www.express.co.uk/posts/view/251427...lls-royal-swans

A DEADLY virus has wiped out more than 180 of the Queen's swans.

David Barber, the Royal Swan Marker, says fewer cygnets will be born on the River Thames this year because duck virus enteritis is killing birds, many of them breeding pairs.

He expects to confirm the decline in births during next month's Swan Upping, the annual census that dates back to the 12th century, that takes place between Sunbury in Surrey and Abingdon in Oxfordshire.

Bolivia reports seven new A/H1N1 flu cases

English.news.cn 2011-06-01 10:47:24 FeedbackPrintRSS
http://news.xinhuanet.com/english2010/heal.../c_13905072.htm

LA PAZ, May 31 (Xinhua) -- Bolivia Tuesday reported seven new cases of A/H1N1 influenza and an increase of severe respiratory infections.

Bolivia's Health and Sports Minister Nila Heredia ordered all health centers in the country to reactivate preventive measures to avoid increase of A/H1N1 influenza cases.

Heredia said severe respiratory infections had increased in past weeks due to strong cold affecting some provinces, mainly including La Paz, Oruro, Potosi and Cochabamba.

She also suggested children should wear more clothes to avoid flu caused by low temperatures.

According to the National Service of Health Information, severe respiratory diseases increased 17 percent in the country last week. Editor: Xiong Tong

TheUnhivedMind - June 1, 2011 02:08 AM (GMT)

African swine fever may spread to Europe: FAO

By Svetlana Kovalyova | Reuters – Thu, 26 May, 2011
http://ca.news.yahoo.com/african-swine-fev...-115313565.html

MILAN (Reuters) - African swine fever (ASF), a viral disease harmless to people but lethal to pigs, is likely to spread beyond Russia and the Caucasus region into Europe, the United Nations' food agency said on Thursday.

ASF, for which there is no vaccine, is now established in Georgia, Armenia and southern Russia, with an increasing number of long-distance jump outbreaks in northern areas this year, the Food and Agriculture Organization (FAO) said.

Long-distance jumps are food-borne, with virus surviving in pig meat products carried by travelers and setting off a new outbreak at the destination where food scraps may be fed to pigs, the FAO said.

"African swine fever is fast becoming a global issue," Juan Lubroth, FAO's Chief Veterinary Officer, said in a statement.

"It now poses an immediate threat to Europe and beyond. Countries need to be on the alert and to strengthen their preparedness and contingency plans," he said.

ASF was introduced into Georgia from southern Africa in 2006 entering through the Black Sea port of Poti, where garbage from a ship was taken to a dump where pigs came to feed, FAO said.

Currently, ASF is spreading northwards at the rate of roughly 350 km a year. Usually, ASF has distinct seasonal outbreaks in the summer and autumn. But long-distance

jumps have also occurred as the ASF wave travels northwards.

The frequency of such jumps is increasing as the originally infected territory enlarges, while the ASF virus strain now spreading is a very aggressive one, the Rome-based FAO said.

BUFFER ZONE IN RUSSIA

ASF is generally prevalent and endemic in countries of sub-Saharan Africa, while in Europe the disease is endemic in the Italian island of Sardinia, according to the World Organization for Animal Health (OIE).

Organization The disease was also present in Spain and Portugal from 1960 to the mid-1990s with the last outbreak in Portugal in 1999, according to OIE and Britain's Department for Environment Food and Rural Affairs.

Europe also had outbreaks of another viral disease of pigs, classical swine fever, or hog cholera, in the past few years. In the late 1990s, the Netherlands had to cull millions of pigs hit by the virus which is not dangerous to humans.

Several outbreaks happened in other countries including Germany and Bulgaria in the 2000s.

Russia said in April it would need 10-12 billion roubles ($351.4 million-$421.6 million) and 7 years to extinguish the rapidly spreading ASF with a plan which foresees setting up a buffer zone in the south of the country.

At the start of the year 17,000 pigs had either died from ASF in Russia or had to be culled, the country's chief veterinarian said in April. Last year some 60,000 pigs had to be culled or died of ASF in Russia.

Strategies to tackle the disease include quarantine, on-farm security and other measures aimed at minimizing the risk of introduction and establishing of ASF.

Early-warning contingency plans include epidemiological information-gathering, training and awareness campaigns.

View Full Version: Winter flu death toll topped 600

Title: Winter flu death toll topped 600

TheUnhivedMind - May 25, 2011 04:49 PM (GMT)

Please remember that only just a few years back in Great Britain 30,000 people died in the one year, a lot were elderly victims. This caused a D-notice to be put out so the knowledge of what was really going on was hidden from the populace. Many victims were removed from hospitals in meat trucks. So a figure of 600 is nothing in comparison although we have to just see who's being whacked is it old or young and theres a lot more young now. Why would they do this? To depopulate, stop you reproducing at the same time whilst removing the real threat to World Government. The Elderly are going to die anyway at some point but you have the potential to live another forty years and you have potential to harm those wishing harm on you.

QUOTE

Winter flu death toll topped 600

By Nick Triggle
25 May 2011 Last updated at 07:23
http://www.bbc.co.uk/news/health-13523971

Last winter's flu outbreak claimed 602 lives in the UK, with more than 70% of the deaths among 15- to 64-year-olds, Health Protection Agency figures show.

Flu normally hits older people, but last winter it acted differently as the main strain was swine flu, which the elderly have some resistance to.

The HPA figures also show just 50% of under-65s in at-risk groups in England and Wales were immunised against flu.

Officials said the vaccination uptake figures were "very concerning".

The figures were better in Scotland where 57.4% of at-risk under-65s were immunised and 74.5% of over-65s.

The flu vaccination programme was beset by problems, with some GPs reported to have run out of jabs.

The government turned to vaccines left over from the pandemic of two years ago which did not protect

people against all the strains in circulation.

There were problems in encouraging more people to come forward for vaccination. Three-quarters of the at-risk groups should be vaccinated, according to targets.

However, the figures released by the Health Protection Agency show that in the healthy pregnant women group, the immunisation rate was just 37%.

The proportion of over-65s coming forward in England and Wales was better at 73%.

The death toll was actually higher than the total during the 2009 pandemic when 474 died. This has been put down to the fact that the pandemic peaked in the summer, when people are less susceptible to illness.

In both periods many more people are likely to have died with flu as a contributory factor, as the HPA records only count those where flu has been cited as a major cause on the death certificate.

Susceptible

Professor John Watson, of the HPA, said: "A concerted effort must be made by healthcare professionals - including GPs and midwives - to encourage those at risk to take up the offer of vaccination. It is the best way to protect against flu."

The government has responded by giving the NHS in England three years to improve uptake to 75%. It will also be setting up an emergency pot of 400,000 doses to be held centrally in case there are shortages next winter. This already happens in Scotland.

But in the long-term it is looking to see whether the whole system needs overhauling. A three-month consultation is being launched to see whether GPs should lose the responsibility for purchasing the vaccines. Under the plans, the Department of Health would take charge of ordering them and distributing them to GPs.

Slightly different systems operate elsewhere in the UK, but a move towards central buying in England could lead to a UK-wide system.

The government believes this would ensure local shortages would be avoided and could help improve uptake.

In the consultation paper, it is argued that GPs would encounter a financial risk if they ordered more vaccines as they are unable to sell on any they do not use.

Ministers also believe a central system may be more efficient, potentially shaving nearly £40m off the £180m bill.

If central purchasing was introduced, it would bring flu vaccination in line with the entire childhood immunisation programme organised by government.

Health Secretary Andrew Lansley said: "A severe flu season places considerable pressure on the NHS and, although it coped well last year, there are areas where I'm determined we can improve."

But the British Medical Association questioned whether changes were needed.

Dr Laurence Buckman, chairman of the BMA's GPs committee, said: "There is no genuine evidence that the system is not working now, so I think GPs are happy with it."

However, he said a move towards a central system would probably not be opposed.

Shadow health secretary John Healey said: "A large part of the blame for the rise in deaths from swine

flu last winter lies at the door of Andrew Lansley.

"He's the one who cancelled the flu-jab advertising campaign that had previously targeted those most at risk. The health secretary should make clear what lessons he has learnt to prevent this happening again."

But the government rejected these claims, saying the vaccination problem was a long-term issue and the lack of a national advertising campaign had not made the situation worse.

Description: *a global health emergency*

TheUnhivedMind - May 21, 2011 12:58 AM (GMT)

Flu experts say world poorly prepared to deal with a global health emergency

By The Associated Press | The Canadian Press – Wed, 18 May, 2011
http://ca.news.yahoo.com/flu-experts-world...-101922486.html

GENEVA - The world is not ready to deal with a lengthy public health emergency, a panel of international experts said Wednesday, basing its conclusions on the swine flu outbreak.

The panel's report on the World Health Organization's handling of the 2009 outbreak of the H1N1 flu concludes that the world is "ill-prepared to respond to a severe influenza pandemic or to any similarly global, sustained and threatening public health emergency."

It found that international health regulations adopted in 2005 by 194 nations are helping improve preparations, but are not being put into practice fast enough globally.

It also said the WHO did some things well during the pandemic and fell short in other areas, but there was "no evidence of malfeasance.

Dr. Harvey Fineberg, who chaired the review panel of 25 experts commissioned by WHO, said what happened during the outbreak was dictated mainly by the virus itself, not the world's response to it.

"Vaccines were produced as quickly as technology permitted, but they came only months after the outbreak," he told reporters at the United Nation's European headquarters in Geneva, where the World Health Assembly was meeting.

"And the world's ability to cope with this kind of severe threat to health is in many ways not up to the task," he added.

Fineberg, the president of the Institute of Medicine in Washington, warned that it will not be easy for nations to find ways to improve their response to an outbreak such as H1N1.

TheUnhivedMind - May 20, 2011 11:44 PM (GMT)

Mysterious illness kills 64 in southwestern Somalia

Friday, May 20, 2011
http://soomaaliyeeytoosoo.blogspot.com/201...ills-64-in.html

An unidentified disease has killed at least 64 people, mainly women and children, in villages in the southwestern Somali region of Bakool over the past three days, elders confirmed on Thursday.

The elders said there are no health facilities in the affected villages of Yoonkoy and Busti around the region's provincial capital of Hudur, which is about 430 kilometers southwest of Mogadishu.

An elder in the region, Omar Isak Madey, told the media Thursday that the strange illness emerged at the beginning of the week and people began dying within 48 hours after becoming infected.

"This is a humanitarian disaster we have never seen before so we are calling for an emergency life saving medical assistance," Madey during a telephone press conference.

"There is a terrible condition here, people are dying and we cannot do anything to save them," the elder lamented.

Most cities and towns in the Bakool region including the provincial capital are under the control of Al-Shabaab militants who have banned international aid agencies from the region.

CDC Warns Public to Prepare for 'Zombie Apocalypse'

By Joshua Rhett Miller
Published May 18, 2011
http://www.foxnews.com/health/2011/05/18/c...test=latestnews

Are you prepared for the impending zombie invasion?

That's the question posed by the Centers for Diseases Control and Prevention in a Monday blog posting gruesomely titled, "Preparedness 101: Zombie Apocalypse." And while it's no joke, CDC officials say it's all about emergency preparation.

"There are all kinds of emergencies out there that we can prepare for," the posting reads. "Take a zombie apocalypse for example. That's right, I said z-o-m-b-i-e a-p-o-c-a-l-y-p-s-e. You may laugh now, but when it happens you'll be happy you read this, and hey, maybe you'll even learn a thing or two about how to prepare for a real emergency."

The post, written by Assistant Surgeon General Ali Khan, instructs readers how to prepare for "flesh-eating zombies" much like how they appeared in Hollywood hits like "Night of the Living Dead" and video games like Resident Evil. Perhaps surprisingly, the same steps you'd take in preparation for an onslaught of ravenous monsters are similar to those suggested in advance of a hurricane or pandemic.

"First of all, you should have an emergency kit in your house," the posting continues. "This includes things like water, food, and other supplies to get you through the first couple of days before you can locate a zombie-free refugee camp (or in the event of a natural disaster, it will buy you some time until you are able to make your way to an evacuation shelter or utility lines are restored)."

Other items to be stashed in such a kit include medications, duct tape, a battery-powered radio, clothes, copies of important documents and first aid supplies.

"Once you've made your emergency kit, you should sit down with your family and come up with an emergency plan," the posting continues. "This includes where you would go and who you would call if zombies started appearing outside your doorstep. You can also implement this plan if there is a flood, earthquake or other emergency."

The idea behind the campaign stemmed from concerns of radiation fears following the earthquake and tsunami that rocked Japan in March. CDC spokesman Dave Daigle told FoxNews.com that someone had asked CDC officials if zombies would be a concern due to radiation fears in Japan and traffic spiked following that mention.

"It's kind of a tongue-in-cheek campaign," Daigle said Wednesday. "We were talking about hurricane preparedness and someone bemoaned that we kept putting out the same messages."

While metrics for the post are not yet available, Daigle said it has become the most popular CDC blog entry in just two days.

"People are so tuned into zombies," he said. "People are really dialed in on zombies. The idea is we're reaching an audience or a segment we'd never reach with typical messages."

Outbreak Of Fatal Horse Virus Spreads To California

May 17, 2011 1:57 PM
http://sacramento.cbslocal.com/2011/05/17/...-to-california/

SACRAMENTO (CBS13/AP) — At least 10 horses in California have tested positive for a deadly horse virus in an outbreak that has hit several Western states and Canada that has spread since a horse competition earlier this month in Utah.

So far, horses in Idaho, Utah, Colorado, California, Washington and Canada have been infected with the highly contagious Equine Herpes Virus-1. The disease poses no threat to people, but it is easily spread among horses, alpacas and llamas because it can be airborne and transmitted by touch or by sharing feed, brushes, bits and other equipment.

The California Department of Food and Agriculture says 10 horses in Kern, Placer, Stanislaus, Amador and Napa counties have confirmed cases of Equine Herpes. One horse in Kern County had to be euthanized after showing severe neurologic signs.

The infected horses were among roughly 500 that attended the National Cutting Horse Association Western National Championships in Ogden, Utah, earlier this month. Now officials in several states, including California, are quarantining infected animals and asking owners of other horses that attended the competition to monitor the animals for symptoms.

Colorado, which has two confirmed cases of the virus, is now requiring permits for any horses being brought into the state. One of the horses was so ill it had to be euthanized, officials said.

The outbreak also has prompted Colorado State University's Veterinary Teaching

Hospital to ban all non-emergency appointments for horses as a precaution, and the university's Equine Sciences Center has cancelled two riding clinics and temporarily restricted horses from entering or leaving the campus.

Washington state veterinarian Leonard Eldridge said a horse that was treated at the Washington State University Veterinary Teaching Hospital in Pullman tested positive for the virus. Testing is being done on several other horses in the state that also attended the Utah event.

Oregon has no reported cases of the virus but is keeping an eye on 18 horses that attended the competition in Utah, said Oregon Department of Agriculture spokesman Bruce Pokarney.

Montana officials are asking the owners of about 35 horses that attended the event to watch for any signs of the disease as well.

Nebraska's state veterinarian has placed five horse farms under quarantine because they had horses that attended the championships.

Infected animals usually get sick between two and 14 days after they are exposed to the virus. Symptoms include fever, sneezing, staggering and partial paralysis.

CDC Delay On Korean H1N1 Non-Mystery Virus Raises Concerns

Recombinomics Commentary 14:30
May 13, 2011

Women with pneumonia tested negative for unknown virus

The authorities are focusing on verifying the origin of the virus by studying the specimen taken from the patient and conducting genetic analysis on it.
"The results are expected to come Thursday but the genetic test will take more than eight weeks, which means that more time is needed," Yang Byoung-goog, a KCDC official, said. "The virus we have extracted from the specimen was more of an ordinary flu virus.

The above comments are a rather indirect way of admitting that the “mystery virus” in South Korea is H1N1. The first quote uses a double negative to say that the virus is known and the second quote characterizes the virus as “more of an ordinary flu virus”. Since the “ordinary flu virus” designation is made by the Korean CDC, there is little doubt that the severe lung disease in pregnant women is being caused by influenza, and fatal infections of pregnant women by pandemic H1N1 is well documented.

However, the “results are expected to come on Thursday” did not meet expectations on Thursday or Friday, which strongly suggesting that some other novel approach for admitting that the “mystery virus” is pandemic H1N1 is under review, which increases the likelihood that the H1N1 is the Chihuahua sub-clade with D225N.

The severity of the cases allowed 8 patients to be identified across the country, with 7 of the 8 being from late term pregnancies. The Chihuahua sub-clade in Mexico led to massive vaccination campaigns when two patrol officers in Juarez died. Like the cases

in Korea, there were initial problems identifying the H1N1, and the index case was never confirmed, even though the infection was fatal and the H1N1 was isolated from the fatal infection in the partner of the index case.

In both outbreaks the severity of the infection was easily recognized, but the initial descriptions cited mystery viruses that caused “atypical pneumonia” in Mexico and “pulmonary fibrosis” in South Korea leading to ProMED RFI reports which failed to identify the virus or even concede that the panic in each country was caused by a virus. The ProMED “atypical pneumonia” RFI pasted in a textbook definition of atypical pneumonia, which cited bacterial and mycoplasma origins and mentioned viruses as an afterthought. The ProMED “pulmonary fibrosis” RFI has a pasted definition that focused on dust particles and failed to note any viral origin or connection between the outbreaks in Mexico and South Korea.

The delay in information from the Korea CDC appears to be yet another effort to avoid acknowledgement of the relationship between the two outbreaks, which continues to increase pandemic concerns, which were noted in the WHO pandemic alert instructing countries in North and South America to activate pandemic preparedness plans.

An acknowledgemnt that the “mystery virus” in South Korea is H1N1 as well as a description of the relationship between the Chihuahua H1N1 with D225N, the subject of the pandemic alert, and the H1N1 in South Korea causing pulmonary fibrosis in previously healthy young adults, including late term pregnancies, is long overdue.

The delays in the release of this information continues to increase pandemic concerns.

Tragic mother who was put in a coma to save her unborn child loses swine flu battle

Last updated at 4:57 PM on 10th May 2011
http://www.dailymail.co.uk/health/article-...flu-battle.html

A young mother who was put in a coma to save her unborn child has lost her six-month fight with swine flu.

Leanne Gunnell, 22, was misdiagnosed twice after falling ill last November.

When doctors discovered she had suffered serious lung damage, they took the radical step of putting her in a coma to offer her and her unborn baby the best chance of survival.

After the birth Miss Gunnell rallied and hopes rose she would recover. But days later tests revealed she had suffered brain damage and she died on Friday.

Her father Simon, 44, paid tribute to Leanne who he said was 'so looking forward to becoming a mother for the first time'.

He said: 'She always thought of everybody else. She was just such a caring child and I know she has touched so many hearts.

Speaking to the Gloucester Citizen, Mr Gunnell added, 'In my eyes, the world has been starved of an angel.

'I don't think many other people would have lasted so long. The nurse said she had beaten all the odds to have survived so long.

'I have lost my precious little girl.'

Miss Gunnell's daughter, Faith, was delivered by Caesarean section on November 30 at Gloucestershire Royal Hospital, weighing just 3lb.

At the end of January Miss Gunnell appeared to be making progress and was breathing on her own, but two weeks ago she suffered a massive brain haemorrhage.

Faith, who for months lay just a few wards away from her mother after being delivered weighing just 3lbs, was allowed home in February and is now a healthy six-month-old baby.

The child is being cared for by Michael Hemming, Miss Gunnell's fiance, with the help of his parents who live just minutes away from Miss Gunnell's family.

Miss Gunnell, a hotel receptionist, had been complaining of being ill for several days with a cold at the end of November.

Six-and-a-half-months pregnant, she went to her doctor's surgery in Matson, where she was told she had a virus and was given antibiotics.

She was not tested for swine flu.

Premature: Miss Gunnell's baby, who was called Faith, was delivered by Caesarean section at 28 weeks

Four days later when Miss Gunnell was still unwell, her parents took her to the out-of-hours GP service and a doctor repeated the diagnosis.

But the next day she was rushed to hospital by ambulance coughing up blood amid fears she had pneumonia.

Doctors at Gloucestershire Royal Hospital discovered her lungs had been so seriously damaged there was little chance of both she and the baby surviving because she was taking in insufficient oxygen.

They said the best chance was to put Miss Gunnell into a coma and deliver the baby at 28 weeks.

Cared for: Faith is now being looked after by Miss Gunnell's fiance Michael Hemmings, and his parents

After the birth both mother and baby, whom Miss Gunnell had already named Faith, seemed to cope well and hopes rose that they would pull through.

But days later Mr and Mrs Gunnell were told their daughter had tested positive for swine flu and preliminary tests suggested she had suffered brain damage.

Speaking in January, Mrs Gunnell described the treatment their daughter and granddaughter had been receiving at the hospital as first class.

Miss Gunnell died surrounded by her family and friends.

View Full Version: Brazil President In Hospital With Pneumonia / Flu

Title: Brazil President In Hospital With Pneumonia / Flu
Description: *like symptoms [H1N1 VACCINE INDUCED!]*

TheUnhivedMind - May 6, 2011 02:01 AM (GMT)

So folks note how she was vaccinated on the 25th of April now add 7 days giving us 2nd May and what do we get? She was given her illness by the VACCINE. Keep well away from these poisons:

QUOTE

Brazil President In Hospital With Pneumonia / Flu-like Symptoms

May 2, 2011
http://www.recombinomics.com/News/05021101..._President.html

Brazilian President Dilma Rousseff is in hospital suffering from pneumonia, her spokesman Rodrigo Baena says.

Ms Rousseff had been admitted to a hospital in Sao Paulo on Saturday after suffering from severe flu symptoms for several days, he said.

He added that the president would stay a second night for further tests.

Ms Rousseff, 63, had to cancel her participation at the World Economic Forum in Rio de Janeiro on Friday because she felt ill.

The above report describes the likely infection of the President of Brazil with H1N1. It also highlights the limitation of vaccination campaigns when H1N1 is circulating. The President was vaccinated on April 25, 2011.

However, the transcript of the 2011/2012 vaccine selection meeting in the United States details H1N1 infections in vaccinated US military, as reported by the Air Force. Release of sequences from US vaccinated cases identified the Chihuahua sub-clade, adding additional support for vaccine escape by the sub-clade reported in Mexico in public reports, and in South America in anecdotal reports which icluded additional examples with D225N in severe or fatal cases, leading to WHO announced pandemic alert.

Moreover, President Rousseff was diagnosed in early 2011 with H1N1, providing further support for evolution away from prior H1N1 sub-clade, as well as the current vaccine used on April 25, 2011.

The above cases follow similar reports for the President of Venezuela, Hugo Chavez, who was also forced to cancel a public address due to “heavy flu” last month.

The above reports support the transmission of H1N1 at the highest levels in South American governments and raise serious concerns about the efficacy of aggressive 2011 H1N1 vaccine campaigns with a vaccine target from early 2009.

TheUnhivedMind - May 1, 2011 02:55 AM (GMT)

In Brief: Two bird flu cases confirmed in Egypt

http://www.irinnews.org/Report.aspx?ReportID=92608

CAIRO, 28 April 2011 (IRIN) - The recent confirmation of two cases of avian influenza in Egypt has raised fresh fears of a possible spread of the disease when the government is still trying to stabilize following mass protests three months ago.

"Chicken traders move large numbers of birds among the governorates uncensured," said Abdel Aziz Al-Sayed, chairman of the Poultry Section at the Egyptian Federation of the Chambers of Commerce. The fragile security in the country, he added, had allowed many poultry shops and farms to emerge in heavily populated areas, increasing the risk.

Of the 143 cases so far confirmed in Egypt, including the latest two, who had the A (H5N1) virus, 47 have been fatal, according to the UN World Health Organization. "We continue to receive large numbers of people who suffer bird flu symptoms," said Mahmud Abdel Meguid, chairman of the Abassiya Fever Hospital. "Most of them test negative, but we have to take these complaints seriously."

Mexican governor says new H1N1 outbreak came from US

Mar 29, 2011 6:41 AM | By Sapa-AFP
http://www.timeslive.co.za/world/article99...ak-came-from-US

A new outbreak of H1N1 in northern Mexico, which left four dead in the past week, originated in the southern United States, says the Chihuahua state governor.

"It has been confirmed that the woman who died in Chihuahua was on a trip from the (US) state of Texas. Also, those infected in Ciudad Juarez were all linked to trips to the United States or contact with US citizens," Cesar Duarte told journalists on Monday.

Duarte said that 18 deaths of people suffering from H1N1 flu had been recorded this year in the US border states of Texas and New Mexico, according to information his office received from US authorities.

Mexican authorities have started a vaccination campaign in northern Chihuahua and ruled out the risk of an emergency on a similar scale to 2009, when Mexico raised the first H1N1 alert.

Swine flu -- so named because it was first identified in pigs -- has killed some 18, 500 people since emerging in April 2009, according to the World Health Organisation (WHO).

An H1N1 outbreak was also recently detected in Venezuela, where health authorities said 415 people had contracted the virus, and three people with H1N1 had died this year.

TheUnhivedMind - April 1, 2011 01:50 AM (GMT)

Mexico Confirms 2 Deaths from Resurgent Swine Flu in Ciudad Juarez

Mar 31 2011
http://www.laht.com/article.asp?ArticleId=...ategoryId=14091

CIUDAD JUAREZ, Mexico – Local Mexican health authorities confirmed the reappearance of the AH1N1 flu virus that flared into an epidemic two years ago and which has now left two dead and another infected in Ciudad Juarez on the United States border.

The Health Secretariat in the state of Chihuahua, where Ciudad Juarez is located, confirmed Friday at a press conference that the virus has taken another life following that of a traffic cop who died several days previously, and has infected another person who appears in stable condition.

The state's health secretary, Sergio Piña, said that clinical studies confirmed the presence of the AH1N1 virus in all three cases.

The official said that the second victim of the virus was identified as a woman between 30 and 35 who died a few hours ago.

Piña said that there are 25 suspected cases, of whom 13 are outpatients not confined to hospital, while the others are under permanent medical observation.

"Among the suspected cases are three people in a very delicate state of health," he said.

For its part, the Education, Culture and Sports Secretariat announced at the same

press conference that it will send any student home that comes to school showing signs of respiratory illness, the precaution taken with a condition that does not appear to be the so-called “human flu.”

State authorities said that of the suspected cases, 14 are females and the other 11 are males.

The federal health secretary, Jose Angel Cordova, confirmed Friday to the media that two people had died and one person was infected, and that a number of suspected cases were under observation.

He said that nationwide there has been an increase in cases of seasonal flu, but noted that this is a less aggressive type of illness.

Cordova said that the outbreak in Ciudad Juarez could be associated with the presence of influenza in the U.S. state of Texas, due to the number of people crossing the border, many of whom have not been vaccinated.

The health minister minimized the numbers and said that “there is no reason for alarm” nor for taking measures such as closing the border, though he added that authorities will keep an eye on the areas adjoining Texas.

From April 2009 to June 2010, Mexican authorities maintained a health alert to control the AH1N1 virus epidemic, which left a total of 1,316 dead and 72,548 infected.

DOW JONES NEWSWIRES

CARACAS -(Dow Jones)- The number of confirmed cases of the AH1N1 flu virus in Venezuela rose to 586, the country's health minister said Thursday.

At the start of this week, officials reported a total of 415 confirmed cases of the virus, commonly called swine flu. The outbreak, which was first announced on March 17, has left two people dead.

Speaking on state television Thursday, Eugenia Sader said the western state of Merida, where the virus was first detected, had the largest number of cases with 195.

Sader also said that Venezuela has sufficient supplies of vaccines as she displayed a number of treatments that are being administered in local health clinics.

The medications have been imported from India, Argentina, Spain and Cuba, Sader said.

One dead as swine flu returns to Venezuela

BY AGENCE FRANCE PRESSE
http://www.capitalfm.co.ke/news/World/One-...uela-12095.html

CARACAS, Mar 18 - At least one person has died from a resurgence of swine flu in Venezuela that infected 12 other people, Health Minister Eugenia Sader said Thursday.

"We have an outbreak of H1N1 in the state of Merida," she said, adding that 12 people have tested positive for the disease and a 32-year-old has died.

Sader said only one of those who tested positive had been hospitalized, with the others treating the disease at home.

Authorities emphasized that the latest outbreak was a far cry from the 2009 global swine flu pandemic, which killed 114 Venezuelans.

Sader said the disease may have been brought in by one of the 160,000 tourists who flocked to the western state of Merida, near the Colombian border, for a bull-fighting festival.

In 2009 the disease spread quickly among the Yanomani tribe, an indigenous people in a remote corner of the Amazon jungle straddling Brazil and Venezuela who at the time were recovering from earlier malaria and flu epidemics.

The swine flu -- so named because it was first identified in pigs in Mexico -- has killed some 18,500 people since emerging in the spring of 2009, according to the World Health Organization.

The WHO said the world had entered a "post-pandemic" phase in August 2010, with the outbreak having "largely run its course."

Call to vaccinate against possible H2N2 flu pandemic

By Dominic Hughes
9 March 2011 Last updated at 18:00
http://www.bbc.co.uk/news/health-12691894

Governments should launch a vaccination programme now to guard against a possible H2N2 flu pandemic, according to an article in the journal Nature.

The US authors say immunity to the H2N2 flu strain is very low in people under the age of 50.

But a safe vaccine already exists after an H2N2 outbreak in the 1950s and '60s.

They say that vaccinating now could save billions of dollars if a pandemic does develop.

Dr Gary Nabel and colleagues from the Vaccine Research Centre in the US say H2N2 has the ability to cause a pandemic in the same way that H1N1 did in 2009.

Between 1957 and 1968, the strain is thought to have caused up to 4 million deaths in a global outbreak, during which time a vaccine was developed.

When the pandemic was over the H2N2 vaccination programme was stopped in the late 1960s, although the virus is still present today among birds and swine.

That means older people will have been vaccinated against the virus, but the relatively young will have missed out - what the authors call the vulnerability of youth.

Between 2003 and 2007 they examined levels of immunity to H2N2 among a small group of 90 people.

"Our study suggests that people under the age of 50 have little or no immunity, and resistance dramatically increases for those older than 50. This was also the case for the 2009 H1N1."

They argue that the vaccine developed in the 1950s would still work today and that governments should use this to develop a pre-emptive vaccination programme.

"One approach would be to manufacture the vaccine licensed in 1957 and immunise enough of the world's population to provide 'herd immunity' to the rest.

"This could be achieved by a 'one-time' campaign to immunise most of the adult population worldwide - for example, as part of standard seasonal flu vaccinations - accompanied by an ongoing programme to administer the vaccine to children."
Cheaper option

The authors say this would be a much cheaper option than stockpiling the vaccine or waiting for a pandemic to strike before boosting production.

Flu strains
There are three types of seasonal influenza - A, B and C
Influenza A viruses are further divided into various subtypes, including H1N1, H1N2, H3N2 and H2N2
H1N1 appeared in 2009 and spread around the world, becoming a pandemic
Source: World Health Organization

"Another major influenza pandemic is likely to cost far more and create a much greater health burden than a well-planned pre-emptive programme.

"The US Centres for Disease Control and Prevention estimates that a pandemic outbreak costs the United States between $71 billion and $167 billion."

Dr Wendy Barclay, Chair in Influenza Virology at Imperial College, says the H2 flu virus does pose a credible pandemic threat, as do other strains of bird flu.

But she believes there are some big questions about whether a pre-emptive vaccination programme would be welcomed by the public.

"Now we are in the calm after the storm of that swine flu pandemic, it is timely to open up the debate about pre-pandemic vaccines. As Dr Nabel himself points out in his article, we have to ask whether the public will want or accept a vaccine against a

disease that does not at the moment exist.

"Work towards making such vaccines available is ongoing in many laboratories around the world.

"Scientifically we are in a position to be able to offer a good solution, the issues to be decided are of cost and of public attitude."

Title: H1N1 and bird flu virus produce dangerous hybrids

TheUnhivedMind - March 7, 2011 01:58 AM (GMT)

H1N1 and bird flu virus produce dangerous hybrids

By Tan Ee Lyn
HONG KONG | Mon Feb 28, 2011 4:18pm EST
http://www.reuters.com/article/2011/02/28/...E71R7B120110228

(Reuters) - The H1N1 swine flu virus is compatible with a bird flu virus that is endemic in poultry in Asia and they can produce hybrid viruses packed with greater killing power, Chinese researchers warned on Monday.

The scientists made 127 hybrid viruses by mixing genes of the H1N1 and the avian H9N2 virus in a laboratory, and eight of the hybrids turned out to be more virulent than either parents when tested in mice.

The H1N1 pandemic of 2009 turned out to be milder than feared and human infections of H9N2 in China in the past are not known to have caused severe disease. But the experts said their hybrid offspring - or "reassortants" - cannot be casually dismissed.

"The main message is that the H1N1 can combine in certain ways with the H9N2 to create reassortants and some of the viruses had an increased pathogenicity comparing with the parent viruses in mice," lead author Jinhua Liu, of the College of Veterinary Medicine at the China Agricultural University in Beijing, wrote in an email to Reuters.

Liu and his colleagues, who published their findings in the Proceedings of the National Academy of Science, warned in their paper: "The possibility of novel pandemic strains being generated from reassortment between avian H9N2 and H1N1/2009 influenza viruses exists."

Flu viruses have eight gene segments and one of the segments is called the PA gene.

Interestingly, all eight dangerous hybrids carried the PA gene belonging to the H1N1 parent virus.

The eight hybrid viruses caused severe pneumonia, edema and hemorrhaging in infected mice, the experts wrote.

Liu said their findings underscored the importance of monitoring hybrid viruses that arise from the H9N2 and H1N1.

The H9N2 is prevalent in China and large antibody surveys in the past found that between 13.7 percent and 37.2 percent of people sampled had prior infections by the H9N2.

"We should decrease the chance of infection with the two viruses in a (single) host," Liu wrote in his email.

Experts believe that a classic way for hybrid viruses to form is when different viruses meet and "marry" inside a single host, swapping genes. Humans and animals, such as pigs, can be efficient "mixing vessels."

Some scientists believe the pandemics of 1958 and 1968 occurred in such a fashion, killing up to two million and one million people worldwide, respectively.

Girl, 3, died from swine flu at short-staffed hospital days after baby was sent home with the virus

By James Tozer
Last updated at 6:23 PM on 1st March 2011
http://www.dailymail.co.uk/news/article-13...t-hospital.html

A hospital where a girl died after doctors failed to spot she had swine flu – just days after a baby was sent home with the same disease – was guilty of a string of failings, a report has found.

The heartbreaking picture of three-year-old Lana Ameen lying on a life support machine after she fell critically ill on Christmas Day triggered an intense debate about whether children should be vaccinated against the potentially deadly virus.

Now the hospital that failed to diagnose Lana, and also twice dismissed five-week-old Harvey Flanagan's parents' worries before his swine flu was finally detected, has been told to change the way it treats children brought into A&E.

After spending more than a week in intensive care, Harvey made a full recovery, but his mother yesterday said she would never take a child there again.

Stepping Hill Hospital in Stockport was criticised in the report for a shortage of specialist nurses and a lack of consultant care at evenings and weekends.

Harvey was seen by a junior doctor who had worked in the accident and emergency department for just ten days, with advice from a consultant only provided over the telephone, the report found.

It also criticised the hospital for failing to take sufficient notice of parents' worries.

Lana had been taken to Stepping Hill on Christmas Eve by her father Zana, a hospital registrar, and mother, with a temperature of almost 104f (40c) – but they were told it was a minor infection.

Harvey Flanagan was left fighting for life with swine flu, after his concerned parents were twice told by doctors at Stepping Hill hospital that he had indigestion

Barely a week earlier, Harvey had been taken to the unit on two consecutive days because he was struggling to breathe, but on both occasions doctors said it was indigestion and he was sent home.

It was only when his parents, Andrew Flanagan and Michelle Dyer, took him to Tameside Hospital, in Ashton-under-Lyne, on the third day that he was finally diagnosed with swine flu.

They expressed their concerns to hospital bosses and said they were assured it would not happen again – just days before Lana was also misdiagnosed.

The report by specialists at Royal Manchester Children's Hospital expressed concern that only two nurses on A&E had specialist children's training, meaning there was frequently none on duty.

Stepping Hill Hospital in Stockport, where Lana was treated, was criticised in a report for a shortage of specialist nurses

Author Dr Rosemary Morton concluded: 'In both episodes the care could have been improved.

'The children would have benefited from the intervention of more experienced doctors,' she added.

Dr Morton said Harvey ought to have been seen by a consultant face-to-face but conceded that it was difficult to diagnose swine flu in the children.

It is understood the probe suggested that in Lana's case an earlier diagnosis of swine flu was unlikely to have changed the care given or prevented her death.

Her mother Gemma, a 28-year-old former healthcare assistant, said: 'Nothing will bring Lana back and because she was so ill we will never know if better care would have saved her – but we are pleased this report has identified what went wrong in so much detail.'

Harvey's 24-year-old mother added: 'We are devastated that after we highlighted the problems we experienced at Stepping Hill, staff then failed to spot Lana had swine flu and she tragically died.

'We would not feel we could take our children there again.'

Stepping Hill chief executive Dr Chris Burke said: 'We have taken on board all Dr Morton's recommendations and have acted on many of them immediately.'

Title: Why I will try to reopen the Baxter case and take
Description: *more legal action to Austria*

TheUnhivedMind - February 27, 2011 03:45 AM (GMT)

Why I will try to reopen the Baxter case and take more legal action in Austria

http://birdflu666.wordpress.com/2011/02/12...tria/#more-4349

When I filed criminal charges against Baxter in Vienna, Austria, in April 2009, I was the only one to initiate an investigation into an incident that could have triggered a global bird flu pandemic with devastating consequences for people around the globe – and I did it in an act of desperation after none of the media, the local NGOs or the political parties responded to my request for them to investigate or publicize the incident.

A Vienna state prosecutor opened an investigation into the Baxter incident as a result of those charges but the investigation was dropped in September 2009. I have never been allowed to see the file or an explanation why.

I plan now to reopen the case– and also to have the justice officials responsible for lying so flagrantly to place me under a court guardianship this summer and for locking me out of my own father's house finally held to account for the way they have so flagrantly broken the law.

The breakdown of the justice system and of law and order in Austria is not just a local concern.

The Baxter incident was of a magnitude to change the course of history, devastating populations, ruining economies and weakening nation states according to the WHO's and government's own predictions. It was a crime against humanity. The pandemic vaccine contained squalene, which was banned in the USA by a Federal Judge because of the evidence it caused so much damage in US veterans who were given the anthrax injection for the Gulf War.

Under special international health regulations drawn up by the UN health body WHO in 2005, people can be forced to take an untested vaccine or to go into quarantine in the event of a pandemic emergency level six being declared. Meticulous plans were even drawn up to dispose the bodies of victims in mass graves and crematoriums.

Supercomputers in the WHO pandemic control room in Geneva to track the spread of the virus were linked to UN security forces. As soon as WHO declared a pandemic level six emergency in June 2009, the world switched to de facto state of martial law.

Billions of people would have been affected by an outbreak of the deadly bird flu.

The World Health Organization (WHO) – which also supplied Baxter with the deadly bird flu virus — predicted staggering numbers of deaths in the event of such a pandemic.

Vaccination plans were put in place by WHO in 2005 to cover six billion people, that is, almost the entire population of the world.

And yet the Austrian government opened no investigation into the contamination of 72 kilos of seasonal flu vaccines with the bird flu virus in Baxter's facilities in Orth an der Donau in February 2009. It did nothing to investigate this case of a pharmaceutical company attempting to trigger a pandemic. Baxter facilities have appeared on a top secret list of key US government sites abroad published by Wikileaks. It is clearly a dual purpose bioweapons plant.

As mentioned, I only filed the charges in a last ditch effort to prevent a repeat of the contamination of vaccine material in Baxter's labs. Just ten days later, the swine flu pandemic broke out close to another Baxter facility in Mexico City.

From the start, I said the swine flu pandemic was hyped by the media and governments, especially the supranational government body, the UN's health watchdog, WHO. I was proved right by subsequent events and investigations.

However, the reality is that no one has been called to account.

And far from being rewarded for my efforts, I was fired from my job after doing some radio shows in the USA to spread the word about the fake pandemic, defamed by the mainstream media that played a large role in hyping the pandemic and persecuted by the very justice officials in Austria that allowed Baxter off the hook and almost stripped of all my civic rights and imprisoned on the basis of a lie by a judge this summer.

My experience shows that Europe is no longer a free society. We no longer have anything like honest or accountable government. Our governments are as corrupt as any regime in Egypt or Algeria and the time has come for us to take action to restore

good government and justice.

The victory of the Egyptians is precarious – and they know it. The same sinister forces that propped Mubarak up – including the US and EU governments – will seek to undermine their revolution. There is still a long way to go before they set up the kind of government that brings real freedom and prosperity. There will be no point in looking to Europe for inspiration. Switzerland is about the only country left with a functioning democracy: people there still control their local governments through oversight of their budgets and spending plans.

But even in Switzerland, more and more powers have been annexed by an unaccountable bureaucracy. Plans were also in place in many cantons in Switzerland to force people to take the pandemic vaccine at special vaccine centres.

What kind of freedom do we have when we can be forced under national pandemic plans to take a vaccine with adjuvants known to cause autoimmune diseases?

How far have we come? How can long can we continue to tolerate such a flagrant abuse of power by our governments?

The neurological damage to young people due to the pandemic vaccine adjuvant that is now being reported in Finland was entirely predictable – and it is just the tip of the iceberg.

The Finnish health authorities reporting these cases themselves recommended the pandemic vaccine with adjuvants and they also have close financial ties to the manufacturer GlaxoSmithKline. The Finnish Ministry of Justice has even opened an investigation into whether bribes were given to officials. Some of the Finnish scientists were caught trying to hide the evidence of damage.

An immunity clause was so important to pharmaceutical companies that they refused to renegotiate it with the Polish Health Minister Ewa Kopacz. A family doctor, Kopacz recognized that the vaccines were not adequately tested and she insisted on the pharamceutical companies taking responsibility for any damage, arguing that if the vaccines were that sake, the pharma companies would have no problem with this. But the pharma companies preferred no contracts to contracts were they were held responsible for the damage.

It was because the pharmaceutical companies knew all about the damage their vaccines would cause that they insisted on the immunity clause.

The governments knew all about the damage the vaccines would cause. The adjuvants had been banned in the US and UK for that very reason.

The then French Health Minister Roselyne Batchelot had to go to a court in Paris to

answer the charge of mass poisoning of the French people by vaccine in January 2010. She – or rather her lawyers – could not give answers to the charges put to her as part of a civil process and the next day, she announced the end of the vaccine campaign.

All across Europe with the exception of Poland, governments marched in lockstep to hype the pandemic and give their populations the toxic pandemic vaccine. All across Europe, governments have tried to bury the evidence of what was actually a deliberate attempt at mass poisoning of the population.

How long can we tolerate a situation where our own governments, the health ministers and justice ministers, and the regulators act in concert with pharmaceutical to give toxic vaccines to their people? Yes, even force them on people?

How long can we tolerate a situation where it is left to ordinary citizens to scramble to warn others of the dangers while the corporate and state media systematically misinform the public of the facts?

It is a great testimony to the sense of responsibility of so many people that the information spread so fast in so many countries. As a result only 1% of the Spanish and Italians took the jab, only 4% of the Austrians and 6% of the French and Germans.

Still, far too many people took this vaccine. Far too many people have suffered damage such as the young people in Finland. Much more damage will emerge with time.

This year, the flu vaccine contained three separate viruses that seemed to have promoted a more lethal mutation.

A report in the Daily Mail in December admitted that 5 of the ten people in the UK who died from the more lethal mutation had gotten the flu vaccine.

This year even fewer people have taken the flu vaccine, showing that the recognition that these jabs are potentially dangerous is growing. Only 36,000 people in Vienna have taken the jab so far, a tiny percent of the total population.

Information is spreading on the alternative media and the internet is increasingly under attack from governments in the USA and Europe, afraid of losing their control over the information we receive that they have had through their grip on the mainstream media.

What kind of freedom of the media do we enjoy in Europe after all when a science journalist like myself who has written for Nature, The Scientist and the BMJ, cannot get the Baxter story printed anywhere – and has to resort to going onto the alternative media to spread information?

What kind of freedom and protection of human rights do we still have when someone like me who takes this initiative is then fired from their job, defamed by the mainstream

media and harassed by the same justice officials that failed to investigate the Baxter incident?

When kind of justice system do we have when an Austrian judge, Judge Michael Lauer was found to have flagrantly lied in order to have me put under a court guardianship in the summer which would have seen me stripped of all my civil rights and pyschiatrised? What action has Bandion Ortner taken against Lauer? None.

Even today the same Judge Lauer continues the same flagrant lies and with the help of the curator Dr Philipp Nierlich has locked me out of my father's house against the law and these two dare tell me it is legal when it is plainly not legal.

From next week I am going to start legal action to bring Baxter and justice officials like Bandion Ortner, Lauer and Nierlich to justice.

It is time that they are held to account for the way they have undermined justice in Austria.

I will begin by asking for the Baxter case to be reopened and also I will allege I am being persecuted by the Justice officials in Hietzing with the full knowledge of Bandion Ortner because I filed charges against Baxter. The curator Philipp Nierlich even said he knew her personally.

It is actually quite shocking to think that the criminal charges of a science journalist, who happens to be based in Austria, were the closest thing to an investigation into this extraordinary event that there was in spite of the tremendous impact it could have had on all people in the EU and the globe by unleasing a global bird pandemic as stated by the Times of India in March.

It is even more shocking that the Austrian government, and specifically, the Justice Minister Claudia Bandion-Ortner allowed the investigation to be stopped in September 2009.

If the Justice Minister was not informed by April 8th, 2009, at the latest, about the evidence that Baxter had deliberately triggered a pandemic endangering the people of Austria, Europe and the world, then the state prosecutor would have informed her under Austrian laws that oblige prosecutors to inform the Justice Ministry about so called "sensitive" cases.

Thirty six people had to be treated preventatively for the bird flu in hospitals in Austria – the Otto Wagner Spital in Vienna — and in the Czech Republic, underlining the danger to human beings.

Far from investigating the incident, the Austrian government has consistently downplayed the risks to people, stating the contaminated material — much of which

was later returned to Baxter — was “experimental material” and only a danger for animals.

The charge that Baxter attempted to start a pandemic deliberately is based on an examination of the facts.

The bird flu virus, an organism that can damage humans, has to be kept in a lab that adheres to strict biosafety level 3 or 4 like all other such viruses, according to EU directives.

It is not at all clear why Baxter had this bird flu virus at its regular flu production facilities in Orth an der Donua in the first place. An examination of patents shows that Baxter has actually modified this virus artifically.

When it comes to biosecurity level 3 or 4, we are talking about a separate lab with extra security precautions such as double doors, electronic access codes, special clothing for lab technicians who manipulate the virus in a cabinet and so on.

These rigorous safety conditions make an accidental contamination of 72 kilos of seasonal flu virtually impossible. The contamination of 72 kilos of seasonal flu vaccine in such a lab implies a plan and intent at the highest levels to subvert all existing safety procedures and spark a worldwide pandemic.

Contaminating 72 kilos of seasonal flu vaccine with the bird flu virus and sending it to 16 labs in four countries inside the EU, including Austria, Slovakia, Germany and the Czech Republic, for injection as an experimental flu vaccine material was an action that threatened humanity.

It was only the quick thinking of a technician at the Czech lab of BioTest, which stopped a bird flu pandemic in February 2009. The technician tested the Baxter material on ferrets who became sick and had to be put down. It later emerged that material sent to all 16 labs by Baxter via a company that Baxter has since bought up, namely Avir in Vienna, was contaminated.

So close did the world come to a bird flu pandemic that Sony issued a special order to staff to return families to Japan immediately on the alert being raised.

It is clear who is set to profit from triggering such a pandemic: the pharmaceutical companies. Baxter, the very company that nearly triggered the bird flu pandemic in February 2009, had sealed contracts with the Austrian government in 2005, among other governments, to supply the vaccines in the event of a pandemic outbreak.

These lucrative contracts for gigantic quantizes of pandemic vaccine material to cover everyone in the country had no break clauses, guaranteeing Baxter and other pharmaceutical companies such as Novartis and GSK and CSL undreamt of profits.

These profits have since become the focus of scrutiny by various invesigations including the Council of Europe Parliamentary Assembly investigation.

It was these very same contracts that were activated shortly after the near bird flu outbreak by the “swine flu” pandemic declaration by WHO on the advice of experts, many of whom have turned out to have links to pharmaceutical companies as is documented by inquiries that have taken place such as the report by UK MP Paul Flynn.

Few people in Austria or other countries around the world were aware that the national pandemic plan from 2005, like other such national plans in Europe implementing WHO’s International Health Regulations, also contained provisions for forced vaccination and quarantine.

The pandemic plan actually makes being potentially infected by the swine flu a criminal offence. Police are allowed to use deadly force against criminal suspects.

Given the impact such a pandemic could have had on people’s civil rights throughout Europe, the Austrian government should have conducted a thorough investigation into what happened at Baxter’s facilities.

WHO, which supplied Baxter with the deadly bird flu virus, which is bioengineered in a US weapons lab according to a report in Der Spiegel, also failed to conduct a proper investigation into this extraordinary incident in spite of announcing one such investigation.

As mentioned, the very existence of the strict biosafety rules offer the strongest proof that this incredible event was a deliberate attempt to spark a worldwide pandemic with the potential to kill millions, devastate economies and even destroy the remnants of the sovereignty of nations.

The Austrian government along with other governments and the EU hyped the dangers of the swine flu virus, which appeared mysteriously in Mexico just a couple of weeks after the Baxter incident. The government also hyped the need for people to take the inadequately tested swine flu vaccine with officials appearing on TV to give large estimates of the number of dead expected.

Is it not acceptable in my view that more than one year later, there has still been no investigation into the Baxter incident in Austria or in Europe even though it could have triggered a far worse pandemic than the swine flu, and resulted in mass deaths, economies collapsing, social upheaval in many nations in different continents, and even in the introduction of martial law.

It is not acceptable that people like me are so flagrantly persecuted.

If justice officials can persecute me like this so flagrantly and get away with it, we do not

live in a free and functioning society. We live in a dictatorship. We live under a regime like the Mubarak regime in Egypt where corrupt officials do as they please with impunity.

Almost every day, there is a new justice scandal in the media: the forging of wills by judges in Voralberg: the apparent murder of a police man investigating the Natasha Kampusch paedophile ring and a cover up by state prosecutors; the persecution of animal rights activists; the obstructions to investigations into the crimes of Hypo Alpe Adria banks and corporations.

No one is safe in this country with this corrupt justice system. Yes, Austria's corruption poses a danger to the whole world as the Baxter case shows.

I am going to do my bit by devoting the next few weeks to legal action against Baxter, Bandion Ortner, Lauer and Nierlich.

If justice is not done, then we, like the people of Egypt, have to recognize the truth about the extent of corruption of our governments – and insist on a restoration of democracy, freedom and justice like the people of Egypt.

<iframe title="YouTube video player" width="480" height="390" src="http://www.youtube.com/embed/MvU6Vt-aAow" frameborder="0" allowfullscreen></iframe>[/dohtml]

http://www.wearechangeuk.co.uk/ members visit 3 major Birmingham Hospitals to share some important information regarding these dangerous vaccines.

The imminent mass swine flu vaccination programme of the British public has left some very serious questions unanswered, so WeAreChangeBrum went on the search for answers. Our findings where truly shocking.....

We discovered the vaccine has been fast tracked around safety testing procedures and that the only tests carried out, where conducted using the vaccine without 'MF59'. The harmful adjuvent MF59, contains 'squalene', which has been linked to a lists of vaccine related injuries and disease.
The vaccine also contains the toxic heavy metal, Mercury in the form of 'thimerosal', a preservative that has been directly linked to Autism, nervous system injuries, Alzheimer's and neurological disorders. In the U.S1976, after a government fear mongering ad campaign for a swine flu
pandemic that never arrived, a mass vaccination program began and 40 million Americans
were given the untested X53A vaccine. The program was halted 10 weeks later because 25 people had died and over 500 people had become afflicted with Guillian-Barres

Syndrome. This is an auto-immune disorder that causes paralysis of the arms and legs and
sometimes the entire body. The official government figures tell us that, to date, 2,000 people have died from this vaccine and 4,000 have been left permanently injured. The figures from independent sources however, claim that in reality its 10 times these amounts.
For many, the swine flu has become a licence to print money. The pharmaceutical giant GlaxoSmithKline is producing most of the UKs vaccines and are estimated to make
£1,000,000,000 from the sale of the vaccine alone. Their anti-viral drug Relenza has made
£230,000,000 in the first half of this year. It is also interesting that one of the governments top swine flu advisors Professor Sir Roy Anderson, who is a member of the
Scientific Advisory Group for Emergencies (SAGE), is a board member at GlaxoSmithKline
earning £116,000 a year. Any advice the Professor gives to the government will not be impartial. Its not just big pharma thats getting rich. Profits are soaring for Superdrug and Lloyds Chemist as people rush to buy everything from digital thermometers to antibacterial
hand gel. Theres a Swine Flu Survival Guide book available for a whopping £22
and your local GP stands to gain from vaccinating the public too. GPs are now working on a
contract that will see them earning £7.51 for every swine flu jab they give us. With the average GP having 1,800 patients that means a potential salary boost of £27,000 (On top
of their annual salary of £107,000). With such large cash incentives, your GP may be tempted to give you an untested vaccine. There are 33,000 GPs in this country, so the cost
to the NHS will be £900,000,000 if everyone is vaccinated, all of which will come out of tax
payers money.
Using vaccines to treat flu viruses can cause the virus to spread and become dominant. Researchers at a Japanese university were among the first to sound the alarm
in March 2009 claiming that flu vaccines, unless well monitored, may induce the dreaded
gene mutation resulting in more hospitalizations and a larger death toll. In China in 2005 a
compulsory vaccination program for all poultry, targeting the H5N1 virus, lead to that particular virus becoming the prevalent variant in each of the 12 provinces, replacing previously established viruses. The same thing has happened in Mexico since 1995 because of the use of H5N2 vaccines. The swine flu vaccines we are being offered may

not
confer immunity but instead induce the very mutation that could kill millions of vulnerable people, especially those who have little or no immunity due to age, existing disease or immune suppression.
You can boost human immunity with vitamin D. Research into vitamin Ds ability to fight off viruses, especially those affecting the respiratory systems, suggests that its the large amounts of the vitamin, made in our skin when exposed to solar radiation, which keeps the flu at bay during the summer months. Vitamin D appears to stimulate immune cells to produce anti-microbial substances that fight and help control the replication of viruses in the body and limit inflammation. A healthy diet and exercise is also an effective
way to boost your resistance to the flu viruses. Make your own mind up on the vaccine!

View Full Version: ALERT: Seizures Now Reported in Kids Receiving Flu

Title: ALERT: Seizures Now Reported in Kids Receiving Flu
Description: *Vaccine*

TheUnhivedMind - February 13, 2011 11:57 PM (GMT)

ALERT: Seizures Now Reported in Kids Receiving Flu Vaccine

http://truthabouthealth.net/alert-seizures..._medium=twitter

The U.S. Food and Drug Administration (FDA) is looking into an uptick in young children having febrile seizures following a flu shot. There have now been 36 confirmed reports of such seizures during the current flu season.

All of the seizures took place less than a day after the children were given Fluzone. Fluzone is currently the sole flu shot recommended for very young children in the U.S.

Google News reports:

“The [FDA] said recommendations for using the vaccine have not changed, nor has there been any change in flu vaccine guidance … FDA officials said they’ve been paying special attention to seizure reports because of an unexplained higher rate of fevers and seizures in young children in Australia and New Zealand who got a specific flu vaccine earlier this year.”

View Full Version: Flu pandemic measures can start late, researchers

Title: Flu pandemic measures can start late, researchers
Description: *says*

TheUnhivedMind - February 13, 2011 03:37 AM (GMT)

Flu pandemic measures can start late, researchers say

By James Gallagher
Health reporter, BBC News
12 February 2011 Last updated at 01:30
http://www.bbc.co.uk/news/health-12416117

Measures to reduce the impact of a flu pandemic, such as closing schools, should not necessarily take place at the beginning of an outbreak, according to computer models.

A report in PLoS Computational Biology argues that starting several weeks later could be more effective.

The researchers said this would have a lower impact on society and the economy.

Experts believe the work could be important for controlling pandemics.

Governments prepare for worst-case scenarios, such as the emergence of a deadly flu outbreak which spreads across the globe.

The UK's pandemic flu plan sets out how the country will deal with such an outbreak.

In the early stages, vaccines are still being developed so measures rely on slowing the spread of a virus, such as closing schools, asking people with flu to stay at home or prescribing antiviral medicines.

When to start?

This study, by researchers at Imperial College London and Utrecht University in the

Netherlands, investigated when those measures should be introduced.

It might be thought that the answer is at the start of the outbreak, but the research suggests this is not always the right one.

The problem comes from measures which the government would only want to apply in the short term, because they are expensive and difficult to maintain.

In this case, the mathematical models show that the timing of measures, such as closing schools or restricting public transport, is important.

If they are introduced when the first cases are recorded, it is costly to society and the economy and there is a large second surge if the measures are lifted.

However, when the researchers delayed the introduction of these measures by several weeks, the size of the pandemic and the peak number of cases were similar to the model in which the measures were introduced at the beginning.

This also has the benefit of reducing the second surge while putting off costly measures.
Pace yourself

Dr Deirdre Hollingsworth, of the Centre for Outbreak Analysis and Modelling at Imperial College London, said: "If you take into account the impact that those policies will have on society, it might be better to hold back at the start.

"It's like pacing yourself for a race: while you can cope with a pandemic you don't want to disrupt public life."

Professor Matt Keeling, who models infectious diseases at the University of Warwick, said: "For ages we've always been saying, hit hard and early, a bit like dealing with compound interest.

"However, if you can only hit for so long, then don't do it at the beginning, target the bit you want to control.

"Like all good computer modelling, the conclusions seem obvious afterwards."

The researchers are clear that their work is not a policy document. However, the Department of Health said it monitored all research in the area and noted the findings with interest.

Dr Nim Pathy from Princeton University said: "Experience of the swine flu pandemic showed just how much uncertainty there can be in these early stages, so this work could have important implications for the practicalities of pandemic control.

"If potentially costly interventions can be delayed even by a matter of weeks, this may buy valuable time to gather important clinical, virological and epidemiological information. Such data would be key in guiding flexible, responsive pandemic control measures."

View Full Version: SWINE FLU VACCINE CAUSING NARCOLEPSY PROBED BY WHO

Title: SWINE FLU VACCINE CAUSING NARCOLEPSY PROBED BY WHO

TheUnhivedMind - February 9, 2011 06:14 PM (GMT)

Swine flu narcolepsy 'link' probed by WHO

By Helen Briggs
8 February 2011 Last updated at 12:59
http://www.bbc.co.uk/news/health-12390540

At least 12 countries have reported a possible link between a swine flu jab and a rare sleeping disorder, the World Health Organization has confirmed.

It said "further investigation was warranted" following reports of 52 cases of narcolepsy linked to the Pandemrix jab in Finland.

Cases have also been reported in Sweden, Iceland and the UK.

The government agency which regulates medicines in the UK said a link had not been confirmed.

The Medicines and Healthcare products Regulatory Agency (MHRA) said: "The Pandemrix vaccine remains available and should continue to be used as recommended.

"The benefits of vaccination outweigh any risk of a possible side effect."

Narcolepsy is a rare condition where a person falls asleep suddenly and unexpectedly.

A possible connection between the swine flu vaccine and the illness first came to light in Finland.

Finland and other Scandinavian countries have reported a general rise in cases of

narcolepsy - in both vaccinated and unvaccinated people - but the cause has not been established.
UK cases

A recent investigation by Finnish authorities found children given the swine flu jab Pandemrix were about nine times more likely to develop narcolepsy than those who had not been vaccinated.

The WHO's global advisory committee on vaccine safety reviewed this, and other data, last week.

It said the committee would continue to monitor the situation and agrees that "further investigation is warranted concerning narcolepsy and vaccination against influenza (H1N1) 2009 with Pandemrix and other pandemic H1N1 vaccines".

The WHO said an increased risk of narcolepsy had not been observed with any other vaccines - for flu or other diseases - in the past.

It said: "Even at this stage, it does not appear that narcolepsy following vaccination against pandemic influenza is a general worldwide phenomenon and this complicates interpretation of the findings in Finland."

The Pandemrix vaccine, made by Glaxo Smith Kline, has been used in 47 countries following the swine flu outbreak last year.

More than six million doses of the H1N1 vaccine have been given in the UK, with more than 30 million given across Europe.

The MHRA said it had received four unconfirmed reports of narcolepsy following vaccination.

It said the reports so far in the UK "are no more than we would expect to see by coincidence after vaccination".

QUOTE

Narcolepsy

Narcolepsy is a rare illness, with around 10 new cases per million people every year

The main symptom is falling asleep suddenly

The cause of narcolepsy remains unclear

Some people may be predisposed to the condition by their genetics

Suggested initial triggers include infections such as measles or mumps, accidents and the hormonal changes that take place in puberty

It most often begins between the ages of 15 and 30

Women warned: Swine flu epidemic

Wednesday 22 December 2010
http://www.marieclaire.co.uk/news/health/5...u-epidemic.html

Swine flu has been off the agenda lately but a new report has revealed that the virus is back - with almost 200 people fighting for their lives in intensive care units across the country.

Experts say that swine flu has reached epidemic status with hospitals struggle to cope

with the increasing number of patients.

Pregnant women are among those most at risk from flu, along with the obese, the elderly and those with underlying health problems that result in a weaker immune system.

'It is one of the highest peaks we've seen in the past 10 years and significantly higher than the average for this time of year,' says Chip Schaible, director of SDI Healthcare - a company that analyses flu rates with UK GPs.

Worryingly, only 40% of those in the 'at risk' group have received the vaccination this year, with the British Medical Association blaming the lack of vaccinations for the growing epidemic.

Richard Firmin, an expert in the H1N1 virus at Glenfield Hospital in Leicester, says: 'The numbers being referred have tripled in the past two or three weeks. We are receiving about half a dozen new referrals each day.'

Professor Lindsey Davies, president of the Faculty of Public Health, has called for health adverts, blaming the government for not making the public aware of the serious dangers.

'It's really disappointing that there has not been a national campaign this year, like there was last year. People needed to be reminded to wash their hands regularly and catch sneezes in tissues,' he says.

For more information and tips on how to protect yourself, visit the NHS website, here.

TheUnhivedMind - December 22, 2010 07:58 PM (GMT)

TheUnhivedMind - December 22, 2010 08:01 PM (GMT)

Do you like how they hide the vaccinations by claiming its because of Winter? You'd see a sharp pike in the Summer if they the did the same but maybe not quite so bad as its the cold which helps the attack even further. So not only do they use the Winter as a shield they use it as an adjuvant shall we say haha as thats a relevant term for this subject don't you think? Remember the Adjuvants will create auto-immune dysfunction like never before and needing of the big pharma for life. When you consider that only big pharma, service and spy jobs will be the economy of the West doesn't it make sense to drum up business ready for the new economic system here?

TheUnhivedMind - December 23, 2010 12:32 AM (GMT)

NHS Direct 'at breaking point': Patients waiting two days for help in worst flu outbreak for ten years

By Louise Eccles and Sophie Borland
Last updated at 11:14 PM on 22nd December 2010
http://www.dailymail.co.uk/news/article-13...reak-years.html

The NHS Direct helpline is at ‘breaking point’ as parts of Britain experience the worst flu outbreak in a decade.

Patients calling the service are being forced to wait up to two days before they can speak to a nurse, and managers have launched an emergency recruitment drive.

GPs in the worst-affected areas are being paid up to £188 an hour to work over Christmas and help deal with soaring numbers of cases.

Infection rates have doubled over the last week and more than 300 patients are fighting for their lives in intensive care, the vast majority suffering from swine flu.

But despite the growing crisis, ministers and leading doctors insist the outbreak is ‘no worse than usual’.

Earlier this week Health Secretary Andrew Lansley told a Cabinet meeting that although figures were slightly up on last year, they were no higher compared with two years ago.

Dame Sally Davies, the interim Chief Medical Officer, has repeatedly insisted that the illness is ‘just winter flu’. Yet doctors in some parts of the country including Leicester and the East Midlands warn they are seeing the worst outbreak in ten years.

There are three strains of flu circulating this winter – swine flu or H1N1, influenza B and H2N3.

Experts say swine flu is far more prevalent than the other two strains, and is proving more deadly. So far this winter there have been 17 confirmed flu deaths, and 14 of the victims had swine flu.

The latest infection rate figures show that there are now 87.1 cases per 100,000 people, up from 32.8 per 100,000 last week.

Children aged five to 14 are the worst affected, followed by those under four, according to the Royal College of GPs.

Over the last few days the number of calls to NHS Direct has soared by 50 per cent and senior nurses say the helpline is ‘at breaking point’.

Last weekend up to 46,000 people called the service, the equivalent of almost 960 an hour.

Callers are categorised as Priority 1, 2 or 3, depending on the severity of the illness, and are then called back by a nurse who advises them on treatment.

Last week a third of ‘Priority 3’ callers – including those with swine flu or norovirus, the

'winter vomiting bug' – waited longer than two hours for a call back, and for some the delay was as long as two days.

Up to 40 per cent of 'Priority 2' callers, such as those with broken bones, waited longer than an hour before speaking to a nurse.

Even the most urgent cases – including suicidal patients or parents fearing their baby has meningitis – are being forced to wait longer than 20 minutes to speak to a nurse.

Managers are urgently trying to recruit more workers and staff are being hauled in on their days off or from their Christmas holidays to help man the phones.

Staff are being asked to take calls from home and are also being encouraged not to take allocated breaks.

One senior nurse told the Mail: 'This is by far the worst it has ever been. People have not been receiving call backs for 48 hours – it's appalling.

'I am concerned about the way the public are being treated. They are not getting the support they need. When they call us about themselves or a relative, they want to speak to someone quickly, not two days later.'

She said the nurses were being put under increasing strain and were expected to take 'call after call without a break'.

Although NHS Direct insists that 99 per cent of the most urgent 'Priority 1' cases are getting through to a nurse within the target time of 20 minutes, staff admit that increasing numbers are being forced to wait longer.

The senior nurse added: 'Sometimes there are 30 Priority 1 cases backing up. It is very stressful.'

Last week there were 5,675 more calls to NHS Direct compared with the same week last year.

Up to 40 per cent of staff at NHS Direct are qualified nurses and the remainder are operators who have undergone a small amount of training in handling calls and offering advice.

Nick Chapman, NHS Direct chief executive, said: 'We apologise if people have had to wait longer than expected to receive a call back from us at this busy time.

'Like the rest of the health service, NHS Direct is extremely busy at this time of year, and last weekend the telephone service received 50 per cent more calls than forecast.

'The excessively cold weather creates demand for health care generally, and in particular for telephone services that you do not need to leave the house to access.'

TheUnhivedMind - December 23, 2010 12:40 AM (GMT)

Well folks we know that H1N1 is in the seasonal flu jab, I wonder if influenza B and H2N3 are too? Wouldn't surprise me in the slightest as these are what we're told are going around. This is biowarfare on the populace which will happen annually from now on. I would like to know how many of these people sick have had the previous swine flu jab or have taken this seasonal flu poison. But heres the reason why all the scare and panic in the media and well we see how this can be used as both a cover and an attack in one:

QUOTE

U.K. Flu jab update 'shockingly low'

Dec 22 2010
http://uk.news.yahoo.com/21/20101222/tuk-f...ow-6323e80.html

The NHS risks being inundated with flu victims because of a "shockingly low" vaccine uptake, a senior doctor has warned.

Prof Steve Field, the former chairman of the Royal College of General Practitioners, also said it was "ill-advised" not to have had a public awareness campaign about the need for seasonal jabs.

He was speaking to The Guardian newspaper after the Department of Health revealed 302 people were in intensive care with flu.

It is unclear how many have swine flu but they are expected to be in the majority.

Prof Field told the Guardian: "Rates of uptake are shockingly low. It was ill-advised not to have the public awareness campaign on seasonal flu jab uptake that we usually have, because we knew that the public and healthcare professionals were likely to become complacent after last year's swine flu pandemic wasn't the serious attack on the country that we thought it could be.

"With the added winter pressures on the NHS, we need NHS staff to be vaccinated as soon as possible, so that they can continue working, and we also need pregnant women and people who are vulnerable to have a flu jab that includes the swine flu vaccine as soon as possible."

As of Monday this week, there were 24 children under five in critical care with confirmed or suspected flu, another 12 aged five to 15, and 243 in the 16 to 64 age group. There were also 23 people aged over 65 in critical care. So far this flu season, 14 people have died with confirmed swine flu and another three from flu type B. Last year, 474 people died from swine flu.

Professor Dame Sally Davies, interim chief medical officer for England, said this season's flu was "just winter flu" but with swine flu as the dominant strain.

"We have not got a pandemic," she said, adding that a vaccine was available and there were levels of immunity in the community. However, she urged at-risk groups to get themselves protected.

To date, fewer patients than last year in at-risk groups, including pregnant women, have come forward for the seasonal flu jab, which also protects against swine flu.

TheUnhivedMind - December 23, 2010 12:44 AM (GMT)

Check out this nonsense below and note how their telling people to take another H1N1 shot even if you've had the pandemic shot. This is getting crazier by the minute, this inquisition is lethal:

> **QUOTE**
>
> This year's seasonal flu vaccine includes important protection against the new H1N1 "swine flu" strain. It does this using a traditional seasonal flu vaccine formula, without the additives used in last year's specially-produced pandemic vaccines. **The new seasonal vaccine is also recommended for people who have already had the swine flu pandemic vaccine**, and strongly recommended for all pregnant women.

Sharp rise in serious flu cases prompts jab questions

Experts are urging people to have the vaccine to protect them against flu viruses

24 December 2010 Last updated at 16:43
http://www.bbc.co.uk/news/health-12075039

The number of people seriously ill in hospital with flu has risen 50% in the past three days, figures show.

Department of Health data from Thursday showed that 460 critical care beds in England were occupied by flu patients, compared with 302 on Monday.

The total number of cases is in line with what would be expected.

But vaccination rates are lower and Labour has urged the health secretary to immediately launch an advertising campaign aimed at the most at-risk.

It is normal for TV and newspaper adverts to run during the autumn, urging at-risk groups to come forward for immunisation. But this year's campaign was scrapped.
Awareness campaign

Dr Richard Vautrey, of the British Medical Association, said: "We wrote to the Department of Health a couple of weeks ago warning about the low uptake. People do not seem to have been taking this year's seasonal flu seriously enough and I think an awareness campaign early on could have helped."

Shadow health secretary John Healey said the government had made the "wrong judgement" in axing the campaign and suggested the decision had directly led to the fall in people coming forward for vaccination.

"The government has backed a public information campaign every year in the last six, investing an annual average of £1.5m. Last year, faced with the swine flu pandemic the last government spent around £15m. The health secretary's decision has left the NHS playing catch-up."

Vaccination rates currently stand at 68.5% for the over 65s and 43% for younger groups that are in the at-risk categories. This is a fall from 70.4% and 48.6% at the same time last year.

It comes amid rising rates of flu. The number of people visiting their GPs with flu more than doubled last week with many among the younger age groups.

What is more, 27 people have died in the UK with flu so far this winter, 24 of whom had swine flu which is one of the three flu strains circulating this winter. That compares to nearly 500 who died with swine flu during last year's pandemic.

But this is still within the range that is expected during winter months and while there has been a sharp rise in the numbers in intensive care, the 460 figure still represents less than 14% of the total number of intensive care beds available. The numbers in intensive care are lower in other parts of the UK.

Health Secretary Andrew Lansley said GPs had identifed who needed to come forward for vaccination and were contacting them directly.

But he added: "It is not clear whether an advertising campaign would have made a difference."

The chief Medical Officer for England, Professor Dame Sally Davies said swine flu tended to affect young people with risk factors such as heart or kidney disease, making a small number of them very ill.

"So it's not surprising that we're seeing an increase in use of critical care beds in the NHS. But it's well within the range that we expect and plan for in winter flu - and indeed it's less than 15% of our critical care beds at the moment," she said.

"The NHS is nowhere near running at capacity and has plenty of capability beyond this."

Last week, five Scottish people were placed in intensive care with swine flu, Health Secretary Nicola Sturgeon said on Thursday.

Eleven people in the country have needed intensive care after contracting the H1N1 strain - with two dying - since the flu season started.

In Northern Ireland there are now 45 reported cases of swine flu compared with 11 last week, the Public Health Agency said on Thursday.

TheUnhivedMind - December 26, 2010 12:49 AM (GMT)

Britain on course for flu epidemic

Britain is on course for its first flu epidemic for more than a decade, according to the Government scientific data.

By Laura Donnelly, Health Correspondent 6:29PM GMT 25 Dec 2010
http://www.telegraph.co.uk/health/healthne...u-epidemic.html

The level of influenza – including the swine flu strain – in the population is now higher – and rising more sharply – than they were at this point in 1999, when the country was heading for an epidemic which triggered a major NHS crisis.

With millions of people visiting friends and family over the Christmas period experts believe that the rate could reach epidemic levels within a week.

The number of flu victims in intensive care has more than doubled in one week, with 460 patients now in critical care beds.

Meanwhile, a Government memo is warning of shortages of Tamiflu – the main drug used to treat flu patients – in some parts of the country.

The rate of flu in England and Wales is 87.1 cases per 100,000 of the population, a rate which has tripled in seven days.

In the run-up to Christmas 1999, levels were less than 60 per 100,000 population, yet by early January 2000 the outbreak had reached epidemic proportions, with more than 200 cases per 100,000.

The records, which only represent those who visit their GP, always underestimate the true extent of sickness.

Influenza expert Prof John Oxford said: 'The numbers now are worse than they were in winter of 1999, and the curve is steeper; when you look at the graph the line for this year it is incredibly unsettling; it looks like scaling Everest," said the virologist.

"If that trend continues I would not be surprised if we get to epidemic levels within one

week."

In the millennium winter, the resulting crisis meant patients were left to wait on trolleys and thousands of elderly people died, prompting then prime minister Tony Blair to order a tripling in health service spending.

Prof Oxford, from Queen Mary University of London said the "massive movements of populations" across the country as families came together for Christmas were likely to be speeding the spread of disease.

He said it was a "great shame" that the Government had taken the decision to axe its annual publicity campaign urging vulnerable people to have their flu jab.

"We don't know what will happen next – everything is now hanging in the lap of the Gods – and it wouldn't have been that way if people had been vaccinated," said the professor of virology.

While the elderly usually suffer worst from flu, research suggests they may have some immunity to swine flu having encountered a similar strain of the disease in previous decades.

As a result, in the event of an epidemic, overall death numbers were unlikely to be as bad as those in the winter 1999/2000, Prof Oxford said, though overall "years of life" lost might be the same, with more children and young adults being struck down.

Latest figures show 27 deaths from flu, 24 of which were from swine flu. Nine of the cases were children.

Across the country, pharmacists are complaining of shortages of Tamiflu, the main drug used to treat the virus.

Prof Dame Sally Davies, the Government's chief medical officer, last week changed the official advice to GPs, instructing them to prescribe the drug to anyone who might benefit – not just those in "high risk" groups.

A Government memo seen by The Sunday Telegraph reveals there are already shortages of the drug in some parts of the country, with concerns that stocks will run out elsewhere as demand increases.

The letter, by Dr Keith Ridge, England's chief pharmaceutical officer, sent to hospitals and pharmacies on Thursday and marked urgent, warns: "Following increased demand for antivirals, there have been reports of localised shortages at both pharmacies and wholesalers".

The letter, which announces the release of more than 50,000 packs of drugs from

national stocks, says increased demand is expected, but that the level is hard to predict.

Pharmacies are told to ensure they have sufficient drugs to give them to patients within 48 hours of them falling ill, but told that stockpiling drugs "will lead to further shortages".

A separate warning about shortages of treatment for babies was issued by the Royal College of GPs on Christmas Eve.

Doctors have been ordered not to prescribe the liquid version of Tamiflu to anyone over the age of one, to ensure there is enough of the formula left for babies.

GPs have been told that patients aged one or more must be given tablets, with parents of children who cannot take tablets given instructions on how to crush and dilute them.

The same practice is more dangerous when the solution is for babies, because of the greater risk of giving too high a dose.

John Healey, shadow health secretary, attacked the Government's decision to axe a national advertising campaign, which until this year had encouraged take-up of flu vaccinations.

Vaccine uptake among under 65s in at risk groups, such as those with conditions like asthma, is five per cent lower than last year, while the number of elderly people being vaccinated has dropped slightly.

He said: "The health secretary should authorise an immediate public advertising campaign to encourage those most at risk to get the flu jab. This is the time to act."

Last weekend Prof Davies criticised ministers for stopping the campaign, after warning hospitals that half of the most severely ill patients treated had previously been in good health.

Andrew Lansley, the Health Secretary, said the numbers of those now critically ill with flu had been a "significant increase".

He said the NHS was "responding well" to the demands on it, and said the Government would continue to monitor the situation carefully.

TheUnhivedMind - December 28, 2010 02:18 AM (GMT)

SWINE FLU COULD ‘KILL HUNDREDS OF UK CHILDREN’

The number of all age groups infected with flu has nearly tripled within a week

Tuesday December 28,2010
By Jane Mathews
http://express.co.uk/posts/view/219738/Swi...of-UK-children-

A FLU epidemic could claim hundreds of young lives this winter, an expert has warned.

Nine of the 27 flu fatalities this year have been children and the figures are set to rise, influenza expert Professor John Oxford has predicted.

Figures show that in the run-up to Christmas the infection rate among those aged five to 14 rose from 58 to 160 per 100,000 people – close to the epidemic threshold of 200 per 100,000.

Professor Oxford, of Bart's and the Royal London Hospital, said that within a week rising infections in all age groups could bring the first flu epidemic since 2000, when thousands of elderly people died.

This time, he warned, many of the victims are likely to be children, who are particularly vulnerable to swine flu, the most dominant strain of the virus.

Prof Oxford said: "The infection rates in the five to 14-year-old age group have almost reached epidemic levels already, and I think they will go up.

"If the trend continues I would not be surprised if we get to epidemic levels within one week. The over-60 age group has got immunity because they have probably seen this virus before.

"Younger people are vulnerable because they haven't seen this virus before – but they are more resilient. The worst case scenario would be a couple of hundred deaths. That's more than enough, but we're not talking thousands."

The number of all age groups infected with flu has nearly tripled within a week to 87.1 per 100,000 people.

So far 27 deaths from flu have been confirmed, including 24 from swine flu, but the real toll is believed to be much higher.

TheUnhivedMind - December 28, 2010 02:19 AM (GMT)

SWINE FLU: BATTLING HARVEY'S BACK HOME

Harvey is back home after he fought off a near-fatal H1N1 infection

Tuesday December 28,2010

By Daily Express Reporter
http://express.co.uk/posts/view/219739/Swi...vey-s-back-home

RELIEVED parents Michelle Dyer and Andrew Flanagan cradle six-week old son Harvey in their arms after he fought off a near-fatal H1N1 infection.

Ms Dyer, 23, and Mr Flanagan, 29, had kept a vigil for Harvey in the intensive care ward of the Royal Manchester Children's Hospital. However, Harvey recovered and was yesterday back at home in Stockport.

Mr Flanagan said Harvey's half-brother William, seven, had not touched his Christmas presents, as "he just wants to be with his brother".

Meanwhile, pregnant Fallon Devaney, 25, who spent seven days in a coma, has discharged herself from Nottingham's Queen's Medical Centre.

Doctors had at one time feared having to chose between saving the mother-of-four or her unborn baby. Being home with her children in Kirk Hallam, Derbyshire, was "her best Christmas present ever," she said.

TheUnhivedMind - December 28, 2010 02:19 AM (GMT)

SWINE FLU: DEVASTATED BOYFRIEND SAYS HE'S LOST EVERYTHING

Tuesday December 28,2010
By Daily Express Reporter
http://express.co.uk/posts/view/219740/Swi...lost-everything

A DEVASTATED boyfriend yesterday said he had "lost everything" after his partner died in childbirth from suspected swine flu along with their baby girl.

Julie Ellison, 31, was admitted to Royal Preston Hospital two weeks ago and placed in quarantine.

After her condition deteriorated, doctors induced baby Jessica but the child died during labour.

Hours later Ms Ellison, from Longridge, Lancs, also died.

Tom Howe, 36, who met Ms Ellison at work at BAE Systems in Samlesbury, choked back tears as he said: "It should have been the happiest day of my life. I don't know what to do."

Mr Howe, who lost his father to cancer last month, added: “I’ve lost everything. Why is life so cruel?”

An inquest has been opened and adjourned at Preston Coroners’ Court.

Ms Ellison had another child, Richard, 12, from a previous relationship, who is now living with his father.

TheUnhivedMind - December 31, 2010 11:50 PM (GMT)

NI swine flu cases increase rapidly

Fri Dec 31, 2010 12:35PM
http://www.presstv.com/detail/158016.html

The number of recorded swine flu cases in Northern Ireland has increased rapidly during the last week, according to the Public Health Agency.

The agency's official data shows that the number of cases has simply doubled from 56 to 129. But it is said that the real number of the cases is a lot higher, according to the BBC.

According to the Public Health Agency, the symptoms of flue are as sudden fever, headache, muscle aches, a dry cough and sore throat, which stays with the patient for 2 weeks. The flu has made people having problems in respiration as well.

Hospitals have been under pressure due to a large number of people experiencing flu. At Belfast City Hospital there were 26 trolleys waiting on Thursday and people were asked to stay away from their local hospital unless they feel really bad.

A Consultant in Health Protection, at the Public Health Agency said that they saw a "continued significant rise" in the number of people coming to the hospitals for seasonal flu cases.

"This is to be expected at this time of year, given the recent particularly cold weather and the circulation of several respiratory viruses...Despite the recent rises, our current flu activity is less than the peaks noted in the past two years. As we expect the flu viruses to continue to circulate for the next few weeks, it is vital that at-risk individuals get vaccinated."

TheUnhivedMind - January 1, 2011 06:20 PM (GMT)

This feminine has hit the nail on the head with her analysis. Their trying to manipulate the populace against those who're not for vaccination. Start to expect mandatory vaccination policies shortly in the U.K. and this will be the way they'll gradually get acceptance to this.

Swine flu kills animal trainer on Harry Potter films

By Nick Mcdermott
Last updated at 11:35 PM on 2nd January 2011
http://www.dailymail.co.uk/news/article-13...l#ixzz19vSRBjlM

An animal trainer who worked on the Harry Potter films has become the latest swine flu victim.

Caroline Lois Benoist, 26, died on the Christmas weekend, only days after being sent home from her job at a film studio when she complained of feeling unwell

Writing to friends on her Facebook page on December 17, her final posting read: ‘Loving being back home even if I do feel like death warmed up!’. She died just over a week later.

From the home they shared in Hemel Hempstead her French boyfriend Guillaume Grange confirmed that doctors believe ‘fit and healthy’ Miss Benoist was a victim of swine flu. ‘She was sent home from work feeling unwell. She died last weekend. I am finding it all very difficult,’ he said.

‘She was a lovely, fit healthy girl. She had no health problems. There was nothing wrong with her.’

Posting on Facebook, he wrote: ‘Thank you everybody for all this support. This [sic] messages warm up my heart. Goodbye Caroline, I will love you for ever!!!!’.

Originally from Guernsey, Miss Benoist had worked for Birds & Animals UK, which provides animal talent for films and TV, for the past seven years.

She was working at Leavesden Film Studios near Watford when she was sent home last month. During her time with the company, she worked on the Harry Potter franchise, as well as other big-budget productions.

The stars of the Potter films, who returned to Leavesden Studios last month for some final re-shoots of Harry Potter and the Deathly Hallows: Part Two, are said to be devastated by the loss of the popular animal trainer.

Studio bosses are now considering vaccinating workers at the site for swine flu following the death. Miss Benoist spent the last six months in Northern Ireland, working on the set of Game of Thrones, an upcoming medieval fantasy television series which is set to debut in America this spring.

She returned to England in mid-December and was at Leavesden Studios for only a day when she was taken ill.

A workmate described Miss Benoist as the ‘perfect colleague’ who was extremely popular on set. She specialised in working with dogs, but also trained a wide range of other animals.

The colleague said: ‘Caroline was extremely popular. We are a close-knit team of animal lovers. She was just great with the animals, and great with people. We are all just shocked, it’s just a massive loss.’

SWINE FLU CRISIS: CHRISTMAS DAY TRAGEDY

John Walsh died on Sunday

Wednesday January 5,2011
By Daily Express reporter
http://express.co.uk/posts/view/221192/Swi...mas-Day-tragedy

A SWINE flu victim who was admitted to hospital on Christmas Day has lost his fight for life.

Barman John Walsh, 21 – described as “happy and bubbly” – was transferred from North Tees Hospital in Stockton-on-Tees to the University Hospital of Hartlepool where he died on Sunday.

He had been ill for some days before seeking treatment. His heartbroken sister Becky, 27, said: “John was a big lad but he had no underlying health issues at all. He was reluctant to go to the doctor’s.”

John worked at the Garrick pub in Stockton. Becky added: “It was his life. He was so happy and bubbly.”

Workmate Katy Hutchcraft, 24, said: “He was crying with pains in his stomach, but said he would be fine. He didn’t like to make a fuss.”

SWINE FLU CRISIS: VIRUS TOOK OUR GIRL

Asthmatic Olivia Rae Clee-Barnett, 17, from Wirral, Merseyside, died early on Sunday

Wednesday January 5,2011
http://express.co.uk/posts/view/221193/Swi...s-took-our-girl

A TEENAGE schoolgirl is believed to be the latest swine flu victim.

Asthmatic Olivia Rae Clee-Barnett, 17, from Wirral, Merseyside, died early on Sunday.

Her devastated family said yesterday they were shocked, adding that popular Olivia was “an extremely beautiful and talented girl” who loved drama and music.

The NHS trust that runs Arrowe Park Hospital has yet to confirm swine flu but if, as expected, they do, Olivia will be the sixth victim from Merseyside. Nationally since October flu has killed 39 people, including 11 under-15s.

Friends have set up a Facebook page for Olivia and more than 1,500 classmates, teachers, friends and relatives have already inundated the website within the first 24 hours with a host of poignant tributes.

She attended Wallasey School’s sixth form. Headteacher Phil Duffy described her as a “very able student”.

Olivia was part of a cast from the school involved in a production of Grease which brought them national TV stardom in 2009. The school beat 500 others nationwide to win a Sky TV contest, Grease: The School Musical.

Their prize was to perform the show at the Novello Theatre in the heart of London’s

West End.

TheUnhivedMind - January 5, 2011 04:32 AM (GMT)

So folks this is the worst outbreak of flu for a decade? What happened to the so-called Swine Flu Pandemic Level 6? It sure looks like this current problem is more widespread than the so-called pandemic. Yet more proof that the Pandemic was a big WHO farce. I believe they were using the level 6 Pandemic in order to Force majeure out of business contracts during dodgy economy events of the time. Now please note also that the NHS gave out many swine flu vaccines during and since the Pandemic 6 attack. So note how many of its staff get ill who've had this poison trash.

QUOTE

NHS laid low by flu as 18,000 staff call in sick in worst outbreak for a decade

By Sophie Borland
Last updated at 11:58 PM on 4th January 2011
http://www.dailymail.co.uk/news/article-13...staff-sick.html

More than 18,000 National Health Service staff were off sick with flu yesterday as hospitals and GPs' surgeries battle one of the worst outbreaks of the virus in more than a decade.

The proportion of doctors, nurses and other NHS staff too ill to come to work was almost 50 per cent higher than the proportion of all other employees in the public and private sector.

Figures show that almost one in every 65 NHS workers called in sick yesterday with flu symptoms.

The figures, compiled by FirstCare, which monitors absence rates for the public and private sector, suggest that 2,000 more NHS staff were off work yesterday than at the same time last year.

Absence rates among NHS staff are normally higher than those for other workers. This can partly be explained by the fact that they pick up illnesses from patients and also because they are advised to stay at home if they are unwell to prevent infections being passed on to patients.

Aaron Ross, of FirstCare said: 'Normally NHS workers' absence rates due to cough, colds and flu-like symptoms are 32 per cent higher than the non-NHS employees FirstCare cover, but as of this morning [Tuesday] this has increased to 47 per cent.

'As NHS workers are such a good barometer of likely trends in cough, cold and flu absences, due to the nature of their work, we can expect to see a general increase across the working population in the coming days.'

The figures also show that 275,000 staff employed in the public and private sector were off sick with flu symptoms yesterday, a rise of 12 per cent on the same day last year.

In total almost two million workers called in sick at an estimated cost to the economy of £302million.

While many were genuinely ill managers suspect that some were simply trying to prolong the Christmas break.

Pregnant women are being refused the flu jab at Boots and other high street chemists and at Tesco. Managers claim it is against their company licence to give them the vaccine – even though such women are classified as being 'at risk' from the infection.

Many GP surgeries have run out of supplies so expectant mothers have been going to pharmacies to pay for it themselves. But most will not vaccinate them or women who are breastfeeding. Yesterday it emerged that chemists were also refusing to vaccinate children.

TheUnhivedMind - January 5, 2011 04:52 AM (GMT)

NEW CRISIS AS SWINE FLU VICTIMS FILL HALF OF INTENSIVE CARE BEDS

Up to half of NHS critical care beds are filled with swine flu victims

Wednesday January 5,2011
By Victoria Fletcher, Health Editor
http://express.co.uk/posts/view/221194/New...nsive-care-beds

UP to half of NHS critical care beds are filled with swine flu victims as the crisis grows, it was claimed yesterday.

Campaigners believe that 1,500 of the 3,000 intensive care beds are now being used to care for patients with flu-like symptoms.

They fear that as Britons return to work and children head back to school today the outbreak could hit a peak.

Figures last week revealed that one in five critical care beds were being used for swine flu patients and that 39 people had died of the virus.

But these figures are expected to have soared over the New Year as the outbreak gathers pace.

Yesterday, it emerged that a 17-year-old girl and a 21-year-old barman are the latest victims of the winter flu.

Olivia Rae Clee-Barnett, from Wirral, died on Sunday from suspected swine flu. She was asthmatic and it is not clear if she had been vaccinated.

John Walsh, 21, an otherwise healthy barman from Stockton, also died on Sunday after battling swine flu and double pneumonia for over a week.

Two more are thought to have died from swine flu on the Isle of Wight.

Last night, child health experts said they had become extremely concerned about the impact that swine flu is having on the young.

They re-iterated Government warnings to parents of any children in at-risk groups to have the swine flu jab immediately. Children with chronic respiratory disease including asthma, chronic neurological, heart, kidney or liver disease, diabetes or a weak immune system should all get the vaccine from their GP.

The Royal College of Paediatrics and Child Health said: “We would therefore encourage all children who are in an at-risk group, such as reduced immunity, breathing difficulties and diabetes – who have not yet been vaccinated – to take up the offer of the vaccination.

“Paediatricians are working closely alongside other medical colleagues, both in community and hospital settings to provide services to children and their families.

“The Department of Health has provided good advice about how to avoid catching and spreading the virus.”

NHS campaigners fear cuts to services will mean the NHS cannot cope with demand from patients as the virus spreads when people return to work.

Geoff Martin, chair of medical campaigning group Health Emergency, said up to half of critical care beds were now being used to treat flu victims.

“In various parts of London and around the country more than 50 per cent of intensive care beds are filled with confirmed or suspected swine flu cases. It’s a huge problem. We run full-tilt on critical care beds, so if you take half the capacity out of the system with one particular epidemic, the availability of beds becomes severely compromised.”

Last week there was some hope the virus may have peaked. But as millions of children return to school, there are concerns there may be another surge.

Dr Douglas Fleming, director of the Royal College of General Practitioners’ research and surveillance centre, warned: “I personally don’t feel that we have quite reached the peak.”

Yesterday, the Department of Health said it would make extra money available to the NHS to cope. The £162million should help hospitals get patients who are better home sooner, to free up beds for the sick. The cash is from savings by cutting back on consultancy, IT, administration and advertising. Health Secretary Andrew Lansley, said: “Savings have been made in the Department of Health’s budget which can now be invested in front line NHS services. It’s really important, particularly at this time of year, that we help people to leave hospital as quickly as they can, when they are ready. The

latest figures show that 2,575 beds are unavailable due to delayed transfers of care."

TheUnhivedMind - January 6, 2011 01:15 AM (GMT)

Egypt's H1N1 Flu Cases Reach 2172

2011-01-03 22:55:10 Xinhua Web Editor: Jiang
http://english.cri.cn/6966/2011/01/03/189s613237.htm

A resurgent H1N1 flu virus has infected 838 people in Egypt within the last week of 2010, bringing the total number of confirmed cases to 2172.

According to Egypt's MENA news agency, Abdel-Rahman Shahin, the spokesman of Health Ministry said on Monday that the latest figures showed that the current rate of swine flu infection was at levels often seen during the winter flu seasons.

He added that the infection rate this year is lower than that of the same period last year, with the total number of confirmed cases since October, 2009 to January, 2010 being 14,846.

H1N1 flu was first discovered in Mexico and the United States in 2009 and quickly spread across the world. In early December last year, Shahin warned of an expected outbreak of the H1N1 virus in the upcoming couple of months.

Severe H1N1 Cases Force UK Black Alerts

Recombinomics Commentary 22:45
December 31, 2010

NHS pressure group Health Emergency said a number of hospitals in East Anglia were on black and red alert, meaning the NHS was struggling to cope as the outbreak worsened.

Chairman Geoff Martin said the James Paget University Hospital in Great Yarmouth had declared a "black alert" yesterday - the most severe status level.

He added that the Norfolk and Norwich University Hospital was on "red alert" - one step below black.

He said: "We warned that hospitals would be forced on to black alert as the flu cases fill the available beds - now it's happening and we do not believe that the chaos is restricted to East Anglia.

The above comments increase concerns that health care delivery in the UK is being taxed by the spike in severe H1N1 cases. The cases in East Anglia and the Greater Manchester area suggest that the H1N1 will soon significantly impact London, where reports cite a 25% occupancy rate of severe H1N1 cases in ICU beds. Moreover, these high levels may be blunted by GP offices closed over the holiday week, and a re-opening of those offices coupled with a return to school may create additional problems next week, including a shortage of ECMO machines.

The number of severe cases has increased from 460 to 738, suggesting triple digits next week, compared to a peak of 180 last season.

The current crisis is exacerbated by a rising number of Tamiflu resistant cases, as well as shortages of anti-virals and vaccines.

The deteriorating situation may lead to more aggressive measures in the upcoming days.

Australia and trH1N1 Recombinant In United Kingdom

December 23, 2010
http://www.recombinomics.com/News/12231003...ion_trH1N1.html

The recent spike in severe and fatal H1N1 cases in the UK has raised concerns that the H1N1 in circulation has evolved into a more virulent form. The WHO update on UK noted that there were changes in UK sequences that had been seen elsewhere, raising concerns that the H1N1 that had been circulating in Australia had migrated to the UK.

Many of the Australian sequences represented a new sub-clade that was linked to sever cases and vaccine breakthrough. Two HA changes had been cited, N142D (N126D in H3 numbering) and E391K (E375K in H3 numbering), which were thought to be involved in the immunological escape and more severe cases.

The Health Protection Agency recently released four HA sequences from cases in the UK. E375K is widespread and present in three of the UK sequences, A/England/4880374/2010, A/England/4780352/2010, A/England/3220137/2010 (see list here). In addition, A/England/4780352/2010 had N126D, confirming that these changes were appearing in the UK (see list here). However, analysis of the S188T sub-clade indicated A/England/4880374/2010 was recombining with A/England/3220137/2010 in the NA and PB2 gene segments.

Moreover, A/England/4780352/2010 had another HA change, D98N, which was also present in Australia (see list here), but was not on the same series of isolates that had N126D, indicating it had been appended onto the background with N126D via recombination. In addition, D98N was present in H1N1 triple reassortants (trH1N1) found in US patients prior to the start of the 2009 pandemic.

Thus, A/England/4780352/2010 is a recombinant with polymorphisms co-circulating in Australia, but on separate sub-clades. The combining of these genetic changes produces a novel sequence, which may play a role in the spike of severe and fatal cases in the UK.

Release of December sequence from such cases would help in determining the involvement of these recombinants in the activity being reported in the UK.

TheUnhivedMind - January 6, 2011 01:54 AM (GMT)

Iran December H1N1 Sequences Match United Kingdom

Recombinomics Commentary 20:45
December 26, 2010

The National Influenza Centre in Tehran has released three sets of recent H1N1 sequences which are closely related to recent sequences from the United Kingdom. One of the HA sequences, from A/Karaj/5327/2010, has S188T (see list here) as well as T1056C and G1403A (here and here) which were present in A/England/4880374/2010, which also had E375K (see list here). The other two HA sequences, from A/Shahriar/5336/2010 and A/Bandar Abbas/5096/2010, are related to A/England/118/2010 (see lists here and here).

All three of the sequences from Iran were from samples collected in December, 2010, confirming that the sequences in the UK are spreading throughout the northern hemisphere.

The Iran sequence with S188T has two additional non-synonymous changes, S146G and A200T (see lists here and here) which were also in A/BRUNEI/218/2010, further confirming the rapid evolution and spread of the S188T sub-clade.

These new acquisitions provide additional support for rapid evolution via recombination and raise concerns that the emerging H1N1 is quickly evolving the 2009 sequences.

TheUnhivedMind - January 6, 2011 01:54 AM (GMT)

Japan and Taiwan H1N1 Sequences Match United Kingdom

Recombinomics Commentary 16:15
December 27, 2010

The CDC and NIID in Japan released a series of partial HA sequences from pH1N1 isolates collected between August and October in Asia (and deposited at GISAID). These sequences had recombination similar to the sequences from the United Kingdom and Iran.

One of the sequences from Taiwan, A/Taiwan/305/2010, contained D98N (se list here) and N126D (see list here), which is the same combination seen in A/England/4780352/2010.

Similarly, S188T was found in A/KANAGAWA/74/2010, which was also seen in A/Karaj/5327/2010 and A/England/4880374/2010 (see list here). The sequence from Japan had the addition markers shared between A/Karaj/5327/2010 and A/BRUNEI/218/2010, including S146G (see list here) .

The latest sequences from Asia confirm the spread of the sequences seen earlier in Australia and indicate the latest strains of H1N1 are rapidly evolving via recombination, which is shuffling individual pH1N1 polymorphisms to generate novel sequences, which are generating alarming severe and fatal cases, as seen in the United Kingdom.

TheUnhivedMind - January 6, 2011 01:54 AM (GMT)

H1N1 Immunological Escape Signals Wave 3

Recombinomics Commentary 17:50
January 5, 2011
http://www.recombinomics.com/News/01051102/H1N1_Wave_3.html

The Irish Nurses and Midwives Organisation has said there were 569 patients on trolleys in hospital emergency departments this morning - the highest number ever recorded.

Critical care beds across Greater Manchester are near breaking point as hospitals battle to cope with a surge in swine flu victims.
The region has around 119 intensive care beds – but at one point yesterday all but three were full.

Dozens of patients have ops postponed at Leicester's hospitals as beds are full
The beds are being used for swine flu patients needing specialist Ecmo (extra corporeal membrane oxygenation) treatment.

ALMOST half of Britain's 3,000 intensive care beds are occupied by swine flu victims. That is the warning from experts who last night said the pandemic – the worst in two decades – shows no sign of easing.
If new cases continue to rise as people return to work and school, hospitals may turn operating theatres into intensive care units.

The above comments are from various media reports describing the pressure on intensive care units at hospitals throughout the UK. The vast majority of these cases are due to H1N1 infections, indicating that the H1N1 circulating in the UK has largely escaped the immunological reponse generated by infection or vaccination with the H1N1 circulating in the UK last season.

The vaccine breakthrough was initially cited in Australia over the summer, and related sequences have become dominant in the UK and other northern hemisphere countries where vaccine breakthroughs and dramatic increases in severe H1N1 cases is becoming increasingly common.

These new infections are creating additional problems because vaccine uptake was low, and preparedness was relaxed because of the WHO declaration of the end of the H1N1 pandemic phase. This declaration was based on widespread immunity due to infections in 2009 as well as a re-emergence of H3N2. However, in many European countries, including the UK, H1N1 dominates and continues to target those under 65. Moreover the frequency of severe cases in patients without underlying conditions is higher, leading to more hospital admissions and an associated increase in admissions requiring ICU beds and ECMO machines.

Recent reports from other northern hemisphere countries, including the United States, have raised concerns that these spikes in H1N1 cases represents the start of a third wave of H1N1 that will sweep through the region and produce greater numbers of severe and fatal cases, leading to a serious strain on health care delivery.

TheUnhivedMind - January 6, 2011 01:55 AM (GMT)

H1N1 Deaths Of Healthy UK Adults Raise Pandemic Concerns

December 30, 2010
http://www.recombinomics.com/News/12301002...Healthy_39.html

HPA is receiving reports of fatal influenza cases from various sources (clinicians, laboratory reports and death certificates). These reports have been reconciled and verified with clinicians. These will not represent all influenza-related deaths.

Twenty-three of the 38 fatal cases with available information (61%) were in one of the

CMO-defined clinical risk groups for vaccination.

The above data is from the latest report by the HPA and indicate that 39% of reported H1N1 fatalities had no broadly defined underlying condition. Although this level is slightly lower than the more than 50% reported last week, the reported cases will be heavily biased towards those with underlying conditions, who are the focus of almost every agency statement coming out of the UK. As noted above, the 38 fatal cases do not represent all H1N1 deaths. Many have not been confirmed and many will not be reported because of a lack of testing.

The high percentage of fatal and severe cases with no underlying conditions is severely straining health care delivery in the UK. The latest spike in severe cases to 738 is well above the peak of 180 cases reported last season, and well above the 460 reported last week. Many of these severe cases will need ECMO machines, which are already stretched to the limit. There are only 20 such machines in the entire country, and on average only two become free each day, so the demand far outstrips the supply leading to needless deaths.

However, the severe pressure on ICU beds and staff will exacerbate the crisis, as more patients are denied care and become more critically ill and/or die.

The latest report also describes an increase in Tamiflu resistance, which will also increase the number of severe cases and deaths, which will create additional concerns.

These problems can be traced to poor planning linked to misguided statements on the end of the pandemic and an associated relaxation of preparedness, which is compound by agency comments attempting to downplay the significance of the crisis, which is spreading to Europe and will soon impact the entire northern hemisphere.

The signal began to appear in Australian and New Zealand where a new sub-clade emerged which was drifting away from last years strain. Ferret antibodies against the new sub-clade had significantly low antibody titers against last year's vaccine target, California/7, and the sequences in the UK show additional drift driven by recombination, as seen in the first four sets of sequences released by the Health Protection Agency. Additional sequences from Iran and Asia demonstrate additional recombination, which will create additional problems.

Such changes are not unexpected. The pandemic H1N1 initial spread because of a lack of immunity, particularly in those under 65. As the population developed immunity, the levels fell and the WHO made its declaration on the end of the pandemic phase, even though H1N1 was killing young adults in India and Australia.

However, pandemic always show such a decline as new variants emerge, and there are no assurances that the new variants will produce a milder disease.

Pandemic H1N1 is a swine influenza which jumped species, as happened in 1918, and excessive deaths in the following year, as seen in 1919, was not unexpected. Indeed, increased travel and population density set the stage for an aggressive re-emergence, as is being seen in the UK, where the proportion of severe and fatal cases in previously healthy young adults is on the rise, and the current vaccine targets the H1N1 isolates in the spring of 2009.

Aggressive actions in the UK and on the vaccine front are long overdue, as are additional sequences from fatal and severe cases in the UK as well as other countries like Egypt and Sri Lanka.

TheUnhivedMind - January 6, 2011 01:55 AM (GMT)

H1N1 Death Cluster In Greater Manchester Increases To 12

December 31, 2010
http://www.recombinomics.com/News/12311001...chester_12.html

A man from Trafford, a patient from Tameside, and a teenage boy, from Oldham, have died after suffering from swine flu and health bosses believe it also contributed to the death of a younger child, from Bury.
Their deaths are expected to bring the death toll from H1N1 in Greater Manchester to twelve out of 36 nationally.

And 27 people, with serious complications caused by flu, are fighting for life in intensive care or high dependency wards in the region's hospitals.
This is putting pressure on the region's hospitals – at times this week there have been no intensive care beds available at some of the region's flagship hospitals including the Manchester Royal Infirmary and the Royal Manchester Children's Hospital.

The above comments describe four more H1N1 deaths in the Greater Manchester area, increasing the number of reported H1N1 deaths to 12, or 1/3 of the UK total. Moreover, there are 27 additional patients with severe disease. This type of cluster signals a more aggressive H1N1, and sequences from such patients would be useful.

The number of severe cases has spiked to 738, from 460 a week ago, and as indicated above, this has significantly pressured health care for H1N1 patients.

The sequences from these patients are critical. Earlier sequences released by the Health Protection Agency demonstrated drift linked to recombination, and raised serious questions regarding vaccine escape.

Moreover, Tamiflu resistance was in the rise, which would add to the increasing burden

associated with severe and fatal case.

ECMO machines are already stretched to the limit, and the dramatic increases in severe cases signal a major pandemic concern that requires aggressive action

TheUnhivedMind - January 6, 2011 01:56 AM (GMT)

UK H1N1 Cases Raise ECMO Usage To 100%

Recombinomics Commentary 17:25
January 3, 2011

Over the past month the National Health Service has increased fourfold the number of special machines that treat critical flu victims.

A portable Ecmo machine was flown by Prince William in a RAF helicopter to treat a young woman who developed swine flu just weeks after giving birth, but she later died in North Manchester General Hospital.

Ecmo is now on offer at seven hospitals around England, with referrals taking place at the country's main Ecmo centre in Glenfield Hospital, Leicester. Those offering the treatment, which requires the use of increased numbers of doctors and nurses, have been told to postpone planned operations.

All 21 beds are now in use, although there is no suggestion that patients are being turned away. But as more patients continue to be considered for Ecmo, health bodies are preparing to buy even more of the £40,000 machines and install them in more centres.

"Although Ecmo is a highly specialised treatment, expert clinicians who perform cardiac surgery and provide critical support to patients in intensive care use many of the same skills and technology required for Ecmo.

"SHAs have been asked to identify appropriate cardiac surgery centres (whose staff do not normally provide the Ecmo services) so that these hospitals can also be authorised to provide a limited Ecmo service. Hospitals will only perform Ecmo if staff are appropriately qualified with the right level of experience. Hospitals will operate to strict clinical protocols and receive advice and support from clinicians at other centres."

The above comments describe the availability of ECMO machines in England. As noted above, one was flown to Manchester in a failed effort to save the life of a young H1N1 patient. The number of critical cases has since risen and was up to 738 last week, compared to 460 a week earlier.

Although the 21 machines is higher than the 12 available last season, they are in full use and it is far from clear that machines are readily available for all of the critical H1N1 patients, which is undoubtedly higher than the 738 announced last week and is likely to grow in part due to the start of school and return to work after the holidays.

Each machine cost £40,000 and more may be ordered, but the current situation raises health care delivery concerns. These concerns extend to children, who have filled ICU beds and an increase associated with the start of school is expected.

TheUnhivedMind - January 6, 2011 01:56 AM (GMT)

H1N1 Dutch Death Cluster Raises Wave 3 Concerns

Recombinomics Commentary 20:35
January 4, 2011

Two children have died of swine flu in Nijmegen, the local health board said on Tuesday. The children were aged four and 11, and the fact they both lived in the same city is a coincidence, the health board said.

National infectious disease council RIVM said there is no reason for panic, despite the resurgence of the disease, which killed 63 people last winter.

The chance of being killed by flu is 'incredibly small', RIVM spokesman Roel Coutinho said.

The above comments describe and H1N1 death cluster in Nijmegen in The Netherlands. The flu season is just beginning to take off in The Netherland, and the report of two pediatric deaths in the same city signal clustering, as has been seen in the UK in Manchester and Liverpool. This type of clustering signals a more virulent H1N1 and in the UK the severe and fatal cases seen in Manchester and Liverpool is now heading into southern England. The same type of cluster in The Netherlands, which is adjacent to England is not surprising.

Vaccine breakthrough in England, Sweden, and Spain signal a new H1N1 sub-clade that is evading the current vaccine. Similar vaccine breakthroughs were seen over the summer in Australia and initial sequences from the UK demonstrate the migration of H1N1 in Australia into the UK.

This spread is beginning to appear in other countries, including Spain, Egypt, and Israel. The dramatic uptick in the UK signals the start of a new pandemic wave, adding further evidence of the error in the WHO proclamation that the initial pandemic phase had ended.

The current sub-clade not only is spreading rapidly, leading to the worst flu season in 20 years, but it continues to target young adults with a higher frequency of severe and fatal cases in patients without underlying conditions.

Although this change in at risk population is clear from initial data in the UK and Spain, agency announcements continue to target at risk populations identified in the waves in 2009. Moreover, these agencies continue to claim that the immunity generated against the H1N1 in waves one and two will offer protection in wave three, but accumulating data indicate those vaccinated against California/7, as well as those infected in 2009 are still vulnerable to H1N1 infection in 2011.

Sequence data from recent severe and fatal cases in the UK, Spain, Sweden, Israel, Egypt, and The Netherlands would be useful.

TheUnhivedMind - January 7, 2011 02:13 AM (GMT)

SURGERY IS CANCELLED FOR 'LAST RESORT' TREATMENT

Hospitals will cancel operations to make way for seriously ill flu patients.

Friday January 7,2011
By Victoria Fletcher
http://express.co.uk/posts/view/221655/Sur...esort-treatment

HOSPITALS have been told to cancel operations to make way for the most seriously ill flu patients.

The NHS is preparing to increase the number of beds available for a highly specialised treatment which is often seen as a last resort.

Extra corporeal membrane oxygenation (ECMO) helps patients whose lungs or heart are failing to work normally and uses an artificial lung to oxygenate blood outside the body.

The main ECMO centre is based at Glenfield Hospital in Leicester. But seven UK hospitals are currently running the treatment.

As of Christmas Eve, 22 such beds were in use across the UK, up from five in early December.

Four more beds are now being arranged. Steps are also being taken to expand this number by cancelling planned operations at some hospitals that provide ECMO.

This will allow heart and lung surgeons to be used to administer the treatment which uses similar skills.

Other hospitals which have specialist respiratory centres and provide intensive care have also been asked to cancel planned operations.

This will ensure that those patients who are been treated with ECMO can then move into intensive care.

If all such beds become full, plans are in place to expand capacity even further.

A hospitals spokeswoman said: “This very specialist, high-risk procedure is being provided by highly-trained specialists at seven hospitals.

“The NHS continues to monitor the situation carefully and we are taking further steps to increase the number of beds available.

“For instance, hospitals providing respiratory ECMO have been asked to take appropriate measures, including postponing planned cardiac surgery, to maximise capacity for patients needing ECMO.

She added: “New advice was issued to the NHS before Christmas to ensure there is additional capacity if all nationally designated ECMO beds are in use.”

TheUnhivedMind - January 7, 2011 02:19 AM (GMT)

Can you see whats happening folks? They had a very serious low turn out for their death vaccines so they've put the fear of the devil into the populace. Then they've purposely made sure theres very little of the new seasonal flu vaccine. Why? In reality they have massive stockpiles of the pandemic vaccines which no one wanted and feared. So now their about to push those out and get rid of them as first intended for the agenda behind them. The pharmaceutical companies would prefer new vaccines were sold as its more profit for them, they've already been paid for those old jabs. See the tricks? Then all this conditioning that flu patients are taking up beds for children and cancer sufferers as if getting the flu is a crime now. Why? So they can bring in draconian compulsory vaccines into the U.K. for the first time and most likely starting with the under five year olds. The people will accept this as they'll be frightened of being labeled a danger to mankind.

QUOTE

Old pandemic flu vaccine 'to fill jabs shortfall'

By Nick Triggle
6 January 2011 Last updated at 17:16
http://www.bbc.co.uk/news/health-12128105

Old vaccines left over from the swine flu pandemic will be used to plug the shortfall in this winter's supplies.

The government made the announcement amid reports that GPs in some parts of the country were running out of jabs.

Doctors have been given immediate access to the 12m stockpile of vaccines from 2009 - but these do not protect against all the strains circulating.

It comes as the death toll in the flu outbreak climbed by 11 in the past week to 50 across the UK.

However, there were signs the outbreak may have peaked.

The latest figures are hard to interpret because of the Christmas break.

The number of patients going to see their GP with flu fell by a fifth last week, but surgeries were shut for two out of the five days.

The pattern is not uniform across the UK either.

GP consultations rates are highest in Northern Ireland, where they actually rose in the past week, whereas Scotland has lower rates than elsewhere.
Critical care

Meanwhile, the number of cases in hospital has started to fall in the last couple of days, although 783 patients remain seriously ill in critical care in England.

NHS chief executive Sir David Nicholson conceded the situation was putting the health service under severe pressure.

He said non-emergency operations were being delayed in some cases, with the north west particularly badly hit.

Nonetheless, officials still felt confident to suggest new cases may have started to plateau.

Of the 50 who have died, 45 had swine flu and five another strain, flu type B.

The deaths are mostly among the under 65s, with five cases in the under-fives and eight cases among those aged five to 14.

This is because the elderly seem to have some immunity to the swine flu virus probably because of some exposure to a similar strain many years ago.

Despite the hope that the outbreak may have peaked, the move to open up the stockpiles of the pandemic virus shows there is real concern about the supply problems being reported.

Prime Minister David Cameron even got involved. He said he had been having regular conversations with the health secretary and the government was "working hard to make sure we get this right".

His intervention came after days of concerns being voiced by patients and GPs.

On Wednesday, the government admitted there were "local supply issues" and said it had asked manufacturers to look across Europe for spare vaccine.

But it is thought there is very little free which could be used in the UK so instead the government has now said it was making the stock of pandemic vaccine available to GPs who needed it.
Shelf life

The 2009 vaccine is different from the jab being offered this year.

It offers protection against just one of the three strains, but as swine flu is the dominant strain in circulation the government said it was the best option available.

Professor David Salisbury, the government's director of immunisation, said the jabs were perfectly useable, safe and effective as they have a shelf life until the end of 2011.

"This will help protect the public against the virus which is causing the most illness."

Interim chief medical officer Dame Sally Davies added: "The message to at-risk groups is if you need the vaccine we have it."

Sara Jones' husband Anthony died after contracting swine flu in December

She said she did not believe the shortages were nationwide, but rather a "mismatch" with excess vaccine in some areas and too little in others.

She said it was unclear why this had happened as the numbers coming forward for immunisation were no different from previous years.

But she suggested some of the so-called "worried well" - those not in the at-risk groups - may have been given it.

Dr Maureen Baker, of the Royal College of GPs, dismissed this, saying some GPs had seen a surge in patients wanting the jab in recent weeks because of the publicity about the outbreak.

She added: "The move to allow us to use the pandemic vaccine is very welcome and should help ease the problems in certain areas."

Shadow health secretary John Healey added: "This action is better late than never but will only add to the confusion over the government's handling of the swine flu outbreak.!

GPs order vaccines directly from manufacturers. They base these on the number of people who come forward for vaccination in previous years.

H1N1 Immunological Escape Signals Wave 3

Recombinomics Commentary 17:50
January 5, 2011

The Irish Nurses and Midwives Organisation has said there were 569 patients on trolleys in hospital emergency departments this morning - the highest number ever recorded.

Critical care beds across Greater Manchester are near breaking point as hospitals battle to cope with a surge in swine flu victims.
The region has around 119 intensive care beds – but at one point yesterday all but three were full.

Dozens of patients have ops postponed at Leicester's hospitals as beds are full
The beds are being used for swine flu patients needing specialist Ecmo (extra corporeal membrane oxygenation) treatment.

ALMOST half of Britain's 3,000 intensive care beds are occupied by swine flu victims. That is the warning from experts who last night said the pandemic – the worst in two decades – shows no sign of easing.
If new cases continue to rise as people return to work and school, hospitals may turn operating theatres into intensive care units.

The above comments are from various media reports describing the pressure on intensive care units at hospitals throughout the UK. The vast majority of these cases are due to H1N1 infections, indicating that the H1N1 circulating in the UK has largely escaped the immunological reponse generated by infection or vaccination with the H1N1 circulating in the UK last season.

The vaccine breakthrough was initially cited in Australia over the summer, and related sequences have become dominant in the UK and other northern hemisphere countries where vaccine breakthroughs and dramatic increases in severe H1N1 cases is becoming increasingly common.

These new infections are creating additional problems because vaccine uptake was low, and preparedness was relaxed because of the WHO declaration of the end of the H1N1 pandemic phase. This declaration was based on widespread immunity due to infections in 2009 as well as a re-emergence of H3N2. However, in many European countries, including the UK, H1N1 dominates and continues to target those under 65. Moreover the frequency of severe cases in patients without underlying conditions is higher, leading to more hospital admissions and an associated increase in admissions requiring ICU beds and ECMO machines.

Recent reports from other northern hemisphere countries, including the United States, have raised concerns that these spikes in H1N1 cases represents the start of a third wave of H1N1 that will sweep through the region and produce greater numbers of severe and fatal cases, leading to a serious strain on health care delivery.

S188T On 22/41 Recent H1N1 Sequences In England

Recombinomics Commentary 23:55
January 6, 2011

The Health Protection Agency has recently published a paper in Eurosuveillance entitled "Virological analysis of fatal influenza cases in the United Kingdom during the early wave of influenza in winter 2010/11." The paper includes a HA phylogenetic tree which includes 41 sequences from the recent outbreak, including the four sequences that were released at GISAID. One of the released sequences, A/

England/4880374/2010, contained S188T, which was seen in early 2010 in a swine from Thailand and was subsequently found in human isolates from Thailand, India, Australia, New Zealand, Ghana, Japan, and Iran, raising concerns that the location adjacent to the receptor binding domain at position 190 would lead to immunological escape, similar to changes seen in seasonal H1N1 associated with the fixing of H274Y.

Vaccine escape had been reported in Australia and the rapid spread of H1N1 in England suggested that the sequences there were also allowing such sequences to spread widely and rapidly.

The phylogenetic confirmed this concern since S188T (labeled S185T in the tree here) was in 22 of the 41 sequences. The tree also had several examples of recombination. D100N (labeled D97N) was not in the released sequence with S188T, but it was in A/England/4780352/2010. However, D100N was appended onto many of the S188T sequences in the phylogenetic tree. Moreover, two sequences with S188T and D100N also had D225G (labeled 222G) which were from two severe cases, A/England/4880378/2010 and A/England/4940476/2010, and the two sequences were identical, signaling transmission.

Information on the relationship between the two severe cases with D225G, as well as release of the 37 sets of H1N1 sequences used in the tree in the paper would be useful.

TheUnhivedMind - January 12, 2011 01:01 AM (GMT)

H1N1 D225G Recombination and Transmission In The UK

Recombinomics Commentary 02:25
January 7, 2011

The Health Protection Agency published a paper on recent sequences from the current H1N1 outbreak, which included phylogenetic analysis of 41 HA sequences. S188T was present in 21 of the 41 sequences, extending its worldwide expansion and domination in England.

However, the sequences with S188T had additional evidence of recombination. One subset had acquired D100N, which was present on an earlier sequence and was also found on different genetic backgrounds outside of England.

Of great concern was two sequences, A/England/4880378/2010 and A/England/4940476/2010, which had D225G appended onto the background with S188T and D100N. D225G had previously been associated with severe and fatal cases in Ukraine and Russia, and to a lesser extent in many countries with sequences representing multiple genetic backgrounds, demonstrating expansion by recombination.

In England both cases with D225G were severe. However, both sequences also were identical, signifying clonal expansion.

The paper did not explain the relationship between the two patients with D225G, but a clonal expansion is a concern. This concern is increased because both sequences contained S188T, which is dominant in England and is likely associated with immunological escape, as well as D100N, which is on multiple genetic backgrounds and also becoming increasingly common.

D225G hitchhiking on a dominant genetic background could lead to a significant increase in the polymorphism leading to more severe and fatal cases. Two of the five HA sequences from 1918 had D225G demonstrating the transmissibility of D225G under the appropriate circumstances.

In the upper branch of the tree with S188T and D100N, 5 of the 7 sequences are from severe or fatal cases, including the two with D225G. Detection of D225G is somewhat dependent on when and where the sample is collected. Thus, the level of D225G on this branch may be higher than the two cases noted.

This branch has two changes in or near the receptor binding domain, D225G and S188T, recombined with D100N, which is on at least two different genetic backgrounds in England, signaling more recombination.

The new combination raises serious concerns about an increased frequency in severe and fatal cases, as seen in England. More information on the two cases with D225G, as well as a release of all sequences used to create the published phylogenic trees would be useful.

Most publications require the deposit of such sequences in a public database so statements and conclusions in the paper can be independently evaluated and confirmed by the scientific community.

TheUnhivedMind - January 12, 2011 01:03 AM (GMT)

S186P On 14/41 Recent H1N1 Sequences In England

Recombinomics Commentary 05:35
January 7, 2011

The Health Protection Agency released four sets of H1N1 sequences at GISAID, which was followed by a paper with phylogenetic analysis of 41 HA sequences from the current 2010/2011 outbreak. The rapid spread of H1N1 suggests the new sequences had escaped from the immunological response generated against last season's H1N1.

One such change was S188T, which was adjacent to receptor binding domain position 190. When H274Y was fixed in seasonal flu, A193T was in all sequences, and it was flanked by changes at positions 187, 189, and 196. Thus, S188T was expected to aid in immunological escape and was present in 22 of the 41 sequences.

However, S186P was also present in one of the four sequences released by the HPA, A/England/118/2010, raising concerns that this change would also generate immunological escape.

The phylogenetic analysis presented in the above paper indicated S186P was in 14 of the 41 sequences.

Thus, 36 of the 41 sequences in the United Kingdom had S186P or S188T, providing a mechanism for immunological escape, and the rapid spread of H1N1 in the UK.

This parallel with the spread of seasonal H1N1 in 2008/2009 increase concerns that the addition of D225G to these drivers of pandemic H1N1 will have a catastrophic effect, which is increased by the presence of D225G on two identical recombinant sequences with S188T.

More information on these two patients, as well as release of the 37 sequences published in the phylogenetic tree would be useful.

TheUnhivedMind - January 12, 2011 01:07 AM (GMT)

Health Protection Agency Releases UK H1N1 Sequences

Recombinomics Commentary 13:45
January 7, 2011

The Health Protection Agency has released the remaining HA sequences (at GISAID) from recent cases in the UK. Included are the sequences with the two key receptor binding changes, S188T (see list here) and S186P (see list here).

The HPA is to be commended for making these key sequences available to the scientific community in a timely manner.

Health Protection Agency Releases UK H1N1 Sequences

Recombinomics Commentary 13:45
January 7, 2011

The Health Protection Agency has released the remaining HA sequences (at GISAID) from recent cases in the UK. Included are the sequences with the two key receptor binding changes, S188T (see list here) and S186P (see list here).

The HPA is to be commended for making these key sequences available to the scientific community in a timely manner.

QUOTE

-ANONYMOUS:
Why do you think they released them so quick. Maybe because after all this is over they can say they did everything possible to help stop the spread. Geez I'm getting way to sceptical. Not good.

I believe D225G is a serious problem and they will hide the fact as long as possible.

The "can't reveal identitity" is a VERY big red flag. It is limited to severe/fatal D225G or related cases.

Polio resurgence casts doubt on global eradication hopes

Chad and DR Congo among 14 countries on brink of health emergency, warns former UK medical chief

Sarah Boseley, health editor
guardian.co.uk, Wednesday 20 July 2011 17.41 BST
http://www.guardian.co.uk/world/2011/jul/2...bal-eradication

The hope of eradicating polio from the planet by the end of 2012 is in serious doubt, a monitoring committee is warning, because the virus is resurgent in places where it had disappeared and cases continue to rise in Pakistan, one of four countries where it is endemic.

"It is on a knife-edge," said Sir Liam Donaldson, the UK's former chief medical officer who now chairs the independent monitoring board of the Global Polio Eradication Initiative. "Success would be a terrific achievement. To eliminate only the second global epidemic disease [after smallpox] would be a tremendous public health triumph, but failure to do so would have enormous consequences. It is a disease that not only affects individuals and families but erodes economic prosperity in some of the countries affected."

Donaldson considers the continued transmission of polio to be "a global health emergency". Eradicating the disease, he said, "is still feasible but more urgency is needed to complete it. The plan to stop transmission by the end of 2012 is not on track."

The latest report from Donaldson's board, set up last year to monitor and guide the eradication effort, shows that a key target was missed at the end of last year. By the

end of 2010, polio should have been stamped out in countries where there had been a resurgence after elimination. It did not happen. The report shows that polio has reappeared in 14 countries.

"The milestone was conclusively missed and the programme must be judged to have performed poorly in this regard," it says.

The biggest concerns are for Chad and Democratic Republic of Congo, with 59 and 80 cases respectively this year. "We are deeply concerned by the situation in DR Congo," says the report. "The worrying picture revealed by vaccination and surveillance data is confirmed by observations of widespread dysfunction on the ground.

"Leadership from the highest level is key for polio eradication and we urge the active involvement of the president in this case. Without his active involvement, we cannot believe that the necessary step-change will occur to interrupt polio transmission in DR Congo."

Polio in Chad, says the report, is widespread and the situation is "of great concern". An emergency action plan has been put into place, but not as quickly as the monitoring board had hoped. The World Health Organisation and Unicef have sent in 100 extra staff to boost vaccination efforts. "The difficult and crucial challenge now is to assemble this new surge of staff into a coordinated functioning team with the utmost speed."Both these countries and 12 others where polio cases have been identified had stopped transmission for at least six months. Four countries have not yet succeeded in doing that – in India, Nigeria, Afghanistan and Pakistan, polio is still endemic.

Excellent progress has been made in India, where mass vaccination days involving more than a million volunteers brought down cases by 94% between 2009 and 2010, from 741 to 42. In the first six months of this year, there has been just one case.

Afghanistan has been doing relatively well in spite of difficulties caused by conflict. Nigeria made excellent progress in 2010, but there has been a loss of momentum following elections, the report says. The leadership is committed, but Kano, in the north, where the Muslim population a few years ago refused immunisation because of false rumours that the vaccine would sterilise their children, "remains a smouldering risk that could yet undermine the whole eradication effort," the board says.

But in Pakistan, cases are going up, not down and conflict and the dismantling of a national ministry of health in favour of local control does not help. "It still looks like it will be the last country to stop transmission, putting its neighbours and the global effort in jeopardy," says the report. "The country needs to muster up relentless energy to really get to grips with the challenges of implementing its emergency action plan."

Title: Africa polio eradication scheme launched

craig-oxley - March 6, 2010 04:21 PM (GMT)

Folks Africa is riddled with DDT and other illegal pesticides and pollutions. The Polio virus only exists when certain filth/radiation enters the body. The protein solvent (virus) is there to try and help you in truth. It is not the virus but the pollutant which is the problem. This below is nothing more than a depopulation to meet the Club of Rome's needs. -Craig

Africa polio eradication scheme launched

The campaign will target children under the age of five in 19 countries

Saturday, 6 March 2010E-mail this to a friend Printable version
http://news.bbc.co.uk/1/hi/world/africa/8553206.stm

A campaign has been launched to eradicate polio in west and central Africa, targeting 85 million children.

Some 400,000 health workers and volunteers will go from door-to-door in 19 countries, giving oral polio vaccine to children under the age of five.

Africa has made significant progress in the fight against polio, which attacks the nervous system, but the virus has still not been stamped out.

Previous efforts at eradication failed as too few children were vaccinated.

The effort is a joint campaign by the Red Cross and United Nations.

Many analysts believe the key to its success lies with Nigeria.

In the past, campaigns in the north of the country were met with suspicion by religious leaders, some of whom even suggested the vaccinations were an attempt to spread sterility and HIV.

But religious groups are now showing support for vaccination drives, and correspondents say there is optimism that the debilitating, sometimes fatal, virus can be eradicated.

Title: Polio -- Then, Now, and Forever

AntiSionist - November 9, 2008 07:59 PM (GMT)

Polio -- Then, Now, and Forever

Dr. Richard L. Bruno calls the poliovirus "the perfect human OFF switch" in his help-book, The Polio Paradox. He encourages his readers to learn the facts about "the awesome power of the poliovirus" calling it "in fact, a guided missile aimed directly at the brain." Survivors and sufferers of related neurological illness experience what he describes as "post-polio sequelae" , or PPS, that can begin years and decades after initial infection. For many victims, most even, they never knew that the flu-like fever they can recall having as children was connected to the debilitating spiral of weakness, fatigue, and "brain fog" that has come to limit and define their diminishing physical reality.(1). The more daunting facts of polio infection are found in relationship to emerging diseases today and the very large, unrecognized, and unacknowledged scope of damage that continues to be wrought by "polio" --as a virus, a chronic disease, a vaccine, and an instrument of government control. The story of polio is still unfolding, and for whatever ways in which it slipped our attention in the past, our future has been irrevocably altered by its path. Telling the story of polio is a trip back in time and place to find the way again to the crossroads. If we meet the devil there, be sure to say hell-o. He likes the attention.

The poliovirus is the world's most studied virus, "discovered" in 1908 by the scientists employed by the Rockefeller Institute, and said to be the first human virus discovery. The brain damage it caused, while still a mysterious agent, was noted by pioneer psychophysiologists in the 1870s who witnessed the neural destruction in the autopsied corpses of victims. The timing came at the the height of Victorian era "scientism" when every perceived disturbance of the social order was thought to be founded in "materialism". Polio potential did not slip the notice of alert Victorians who were cataloguing the physical basis of mental illness. Their understanding of the foundations of polio infection as the result of chemical poisoning is fairly certain, though the microbial interactions of biology and chemistry were still in a gross state of observation,

but they certainly did know its devastating effects. The British Dr. William Hirsch collected the known body of science investigations into polio and published them for the European research community in 1899. By 1903, the first medical articles on the phenomena of "late-onset" progressive paralysis appeared in America. That same year the Rockefeller Insitute for Medical Research installed its first permanent director, Dr. Simon Flexner, and settled into the direction of medical exploration that came to define the very roots of "western medicine". Polio was the emerging disease of the new century, and Simon Flexner staked a distinctively personal claim over its investigation.

When John Shaw Billings took up a knight's errand to recruit faculty for the new Johns Hopkins medical school (opened in 1893) he walked straight into a scene from the book "Faust", the exact spot in a Bavarian tavern where Dr. Faust was said to have made a bargain for his soul. Billings went to

Germany to meet William Welch and convince him to take a post on behalf of the yet-fledgling institute and its president Daniel Coit Gilman. "Billings and Welch talked passionately of science deep into the night, while the murals [of Faust and the Devil] endowed their words with conspiratorial irony. Billings spoke of the plans for the Hopkins : unheard of admission standards for students, labs that filled great buildings, the most modern hospital in the world, and of course a brilliant faculty. They also talked about life, about each other's goals." Warming to the glow of ambitious prospects, writer John Barry reveals that Welch "opened his soul". (2). It would be a number of years before the bargain struck on that day came to fruition. In the meantime, Welch would take a teaching post at the Bellevue Hospital College in New York, and lament his sorry lot, writing, "I sometimes feel rather blue when I look ahead and see that I am not going to be able to realize my aspirations in life...There is no opportunity in this country, and it seems unlikely there will ever be...I can teach...perhaps get some practice and make a living after a while, but that is all patchwork and the drudgery of life and what hundreds do." Son of wealthy Connecticut physicians and drugstore owners, Welch had a marked ennui for the work-a-day ritual and a downcast outlook through his younger years as if waiting for his "special genius" to be noticed and rewarded. That time came soon enough from the Hopkins and the Rockefeller Insitute founders, who saw in William Welch just the sort of man they were looking for. He had the qualities of an aloof maker of empire who could select and delegate to his juniors and then retreat from the fray to enjoy his high-society indulgences. Rockefeller chose Welch and Welch chose Flexner.

So begins a story of the greatest bioweapon "nerve agent" ever to be perpetrated upon humankind. Known to ancient Egyptians as a crippling illness of artisans in metal and stone, the poliovirus and its kindred poisons, the smallest of all bioactive substances revealed by the electron microscopes of the 1930s was set upon the world when the whole world was at it's most vulnerable --the 1950s and the Cold War age of nuclear weapons testing. In those days, in the youth of generations living today, the entire globe

was wrapped in radioactive chemical fallout 40,000 times greater than the Bomb that exploded above Hiroshima Japan. (3). We were a "naive" population then, physiologically virginal to Bomb chemistry. But there is no getting used to radioactivity, unlike perhaps an acqiured tolerance to other substances. It is not a substance in that sense, but a quality of energy that is enormously powerful in comparison to living cells, capable of literally blowing them apart. Ionizing, electrically charged particle radiation is the great "X" factor in the equation of Life, and as the U.S. Department of Energy (DoE) reports, a most efficient destroyer of the sensitive internal tissues of the small intestine and bone marrow. There, in the small intestine, is where the poliovirus thrives--poliovirus and its family of enteroviruses, all 72 clan "types" with hundreds of members.

&n bsp; The disease of "polio" has been removed from popular exposure like a badly-worded phrase cut from a commencement speech: the words changed but the intent remains. Looking back over the science journals through experiments with X-rays and chemicals is an exercise in sifting out that very "intent", for it is not until recently that the true causes of polio infection are casually discussed. It is common knowledge to the research communtity that "chemicals and radiation" cause disease. Seldom is it elaborated upon for the public's benefit of understanding. In his Congressional testimony on the medical nature of Gulf War Syndrome (Feb. 02, 2000), recognized expert Dr. Howard B. Urnovitz clearly and briefly describes his post-grad lab experience, "A quarter of a century ago I began my doctoral research in a lab that studied how to create polio in mice without any poliovirus: by manipulating the junk DNA with toxic chemicals or radiation. Gulf War Syndrome has convinced me that these same interactions of toxic exposures and chronic diseases occur in humans as well ". In a nutshell then, polio was the benchmark achievement of geneticists-in-training. Dr. Urnovitz went on to found the Chronic Illness Research Foundation and the pharmaceutical house Chronix Biomedical. He added in his testimony that genes "reshuffle" as an adaptive response to toxic environments caused by "confounding events" which can turn the reshuffling mechanism from a normal to a disease process -- again, from the testimony, the man said "chemicals OR radiation".

Vaccine development, which has always been a contentiously debated method of disease management, was possibly never more contentious than in the procurement of a polio vaccine. Dr. William McD. Hammon was a participant in the 1940s "typing" of poliovirus who realized that the multiplicity of polio forms made an "active immunity" vaccine unadvisable. Instead of the Salk-Sabin-Koprowski vaccines that came into use, Hammon worked on a gamma-globulin vaccine that protected through "passive immunity" though ironically inclined to believe in the 1940s that polio was an unimportant disease. (4). Hammon, who had trained as a missionary in the Belgian Congo, was assigned rank and privilege as a member of the medical "Commissions" system organized by the U.S. Army in preparation for WWII. The incentive for research scientists enlisted in the AFEB (5) was the auspicious endowment of government Defense contracts to their home insitutions and the personal potential of authoritative

civilian positions in the coming post-war. Hardly an occasion to say No when the government wants you to make a vaccine. Salk and Sabin were members of the AFEB commissions and so was every appropriately aged polio researcher who made a vital contribution, famous and not. Those not listed with the AFEB were indoctrinated Rockefellows, just as we've come to expect, for it becomes ever more clear to investigating eyes that the global medical establishment promoted by John D. Rockefeller Jr. and his allies has existed for the benefit of waging war.

Another irony in the vaccine campaign is significantly explained in The Polio Paradox. For the record, author Richard Bruno has built a practice for himself and others treating the late-onset distress of polio-like illnesses. Through the creation of the Post-Polio Institute and a number of organizations designed to support it, including the International Post-Polio Task Force, they carry their work forward with the motto "Every child vaccinated. Every polio survivor --and doctor-- educated". He's a true believer, we must know, in the effectiveness of the great polio vaccines. His certainty is confirmed in the fact that no data on the actual number of Polio cases after the vaccine (1955) is given in his book. We are treated to a graph that goes completely flat on the line of "zero cases". Between historical information segments, however, a long stretch of self-help for the readers resolves in the real message of the book. He writes, "It may be that the vaccine that eliminated polio had an unintended consequence" because "something unexpected, frightening, and totally unrecognized happened after the polio vaccine was distributed," --here is the meat-- "the number of myalgic encephalomyelitis [ME] cases went through the roof... Despite the differences between polio and ME, an association with the poliovirus was suggested by the fact that of more than a dozen ME outbreaks before the introduction of the polio vaccine in 1954, nine occurred during or immediately after outbreaks of polio...between 1960 and 1980 the number of ME patients increased fifty-fold. Between 1980 and 1990, the number of patients with ME increased yet again by a factor of fifty! Throughout the world, thirty-two ME outbreaks were recorded after the polio vaccine was distributed....[and] while British ME cases skyrocketed unnoticed during the 1980s, a "new" disease [was] discovered in the United States... Residents of Nevada reported strange symptoms --fatigue, difficulty concentrating, and aching muscles-- that were called "chronic fatigue syndrome". Because we are assured that the new illnesses are "absolutely not" polio, the explanation is provided. "The elimination of the poliovirus left a vacuum that had to be filled...With poliovirus gone, the other enteroviruses were able to multiply, spill into the bloodstream, and enter the brain... It isn't just the polioviruses that enter and kill neurons... One Coxsackie virus, named A7, produces paralytic symptoms so similar to polio that it has been named poliovirus Type IV. Other nonpolio enteroviruses that cause damage and symptoms similar to the polioviruses include all the other Coxsackie viruses, the ECHO viruses (which in 1956 were the first viruses associated with an ME outbreak), enterovirus 71, and viruses that cause illnesses that evoke some faraway places...central European encephalomyelitis, Australian X, Japanese B, and St. Louis encephalitis". How a

miscarriage of logic like Bruno's vaccine support remains standing is anybody's guess. He avoids taking any stabs at mutation theories. He says nothing about the quality of the polio vaccine of today or any controversies surrounding vaccine at all. In his way, he's got us on a technicality.

But there are many more examples of diseases and poisonings that are linked to the poliovirus and vaccine. Researchers like Janine Roberts have demonstrated the statistical manipulation of polio as it came onto the world stage, thereby giving the necessarily false impression of successful "heroic medicine" even in the face of myriad new disease. But, touching that forbidden Third Rail, the X-rail, if you'll pardon the oddness of punning, weaves together a much bigger story of polio than almost anyone is daring to tell. To believe it is to be set awash in circumstantial evidence. To comprehend it is to know the deeper meaning of "malice aforethought".

craig-oxley - November 10, 2008 01:13 AM (GMT)

You do realise that many diseases including Polio get called many other names right? Remember when people vaccinated against Polio, got Polio they called it something else, I forget which. I still believe DDT plays the big part in the past and other areas now where it's still used. They want to bring it back in the West, God help everyone if they do. You cannot vaccinate against chemicals period! I would also like to point out that the Spanish Inquisition does not Vaccinate anyone but infact they inoculate everyone meaning TO POISON!

The Copenhagen Carbon Circus

Published on 10-24-2009 Email To Friend Print Version
http://www.timesonline.co.uk/tol/news/scie...icle6888246.ece

It has been billed as the last-chance saloon; a final opportunity for the world to seal a deal to prevent catastrophic climate change.

With only 44 days to go until the meeting in Copenhagen, the world is waiting to see if its politicians can deliver, and live up to the hype.

Whatever the outcome of the 15th Conference of the Parties to the United Nations Framework Convention on Climate Change, Copenhagen is braced for a carbon circus.

Hotels in the Danish capital are nearly fully booked, meaning that thousands of those due to arrive in the city from December 7 to 18 will have to stay in neighbouring Sweden — pumping out more carbon when they commute daily across the Öresund straits from Malmö.

Amid the razzmatazz, protesters and corporate sponsorship from BMW, Honda and Mercedes, as many as 20,000 delegates from 192 countries will cram into the Bella centre. Their aim is to forge a deal that will cut global greenhouse gas emissions and prevent a rise in temperatures of more than 2C (3.6F).

Scientists believe that any increase above this level would be the tipping point for irreversible damage — paving the way for rising seas, floods, storms and droughts that would threaten hundreds of millions of people.

At the centre of this meeting, led by Yvo de Boer, the UN climate head, is a 180-page document of negotiating text. The Kyoto Protocol, by contrast, which the Copenhagen agreement is meant to replace when it expires in 2012, ran to only 30 pages at the equivalent stage.

“There is limited time and so much to be done,” Andrew Hedges, a partner at Norton Rose, which specialises in carbon law, said. “If political leaders fail then the scientists tell us that the consequences could be catastrophic.”

That may sound like a powerful incentive for a deal to be struck but the challenges are immense.

Perhaps the biggest stumbling block is the complex climate politics between the US, China and India. Developing countries led by China — which is the biggest carbon polluter in the world — and India say that by 2020 the developed world needs to commit itself to cuts at least 40 per cent below 1990 levels to avoid the worst of climate change.

In the US, the second-biggest emitter, the focus on healthcare reform has reduced the

chances of a commitment on anything like this scale. The US Senate has not agreed a goal for 2020.

Although China and India are not expected to agree to cuts in their emissions before 2020, coaxing them into longer-term reductions without US leadership will be tough.

It is a stalemate that threatens to kill a deal in Copenhagen despite pledges from the EU, Japan and other countries to cut their emissions by as much as 30 per cent by 2020 — and good progress that has been made in other areas such as an agreement designed to slow global deforestation by awarding forest credits.

There are many reasons why the Kyoto Protocol failed to curb the growth in global emissions; one of which is that its targets applied only to a small group of affluent countries and ignored rapidly growing emissions from the developing world.

Governments want the new treaty to encompass more nations and more sources of greenhouse gases, such as forestry and changing land use. They also want to create a framework for wealthy countries to supply money and technology to poor nations to help them to adapt to and reduce the inevitable impacts of climate change.They are keen to refine a global trading regime for carbon emissions to help to cut greenhouse gases from industry.

Copenhagen is perhaps viewed best as a Bretton Woods for carbon — an agreement that, if successful, could define the global industrial and commercial landscape of the 21st century.

Talk of it as a last-chance saloon may be premature. The most likely outcome may be a political commitment to cut emissions by mid-century and an agreement to keep wrangling over the details.

Scientists believe climate change is an urgent problem and that, according to the last report by the Intergovernmental Panel on Climate Change, it is more than 90 per cent likely that humans are responsible.

There is already talk of follow-up meetings next year. Copenhagen may merely mark the start of a long period of uncertainty over global carbon regulation that may take years to resolve.

craig-oxley - October 25, 2009 05:27 PM (GMT)

Enslavement by a New Copenhagen Protocol to the Climate Change Treaty

Published on 10-22-2009 Email To Friend Print Version
http://worldviewtimes.com/article.php/arti...owse/Henry-Lamb

Copenhagen is about to become the successor to Kyoto as the synonym for the U.N.'s plan to control climate change. The 15th meeting of the Conference of the Parties to the U.N. Framework Convention on Climate Change will meet in Copenhagen December 7-18. Until this meeting ends, expect to hear a growing number of climate-related horror stories, presented by a wide array of so-called environmentalists, at a rising decibel level that's sure to drive the sane quite mad.

The UNFCCC was a voluntary treaty through which the United States agreed to voluntarily reduce carbon emissions in 1992. At the very first meeting of the COP in 1995, the delegates decided to add a "Protocol" to the treaty that would make specific emissions reduction targets set by the U.N. body legally binding on 34 developed nations. The U.S. Senate adopted a resolution instructing the Clinton administration to not participate in the Protocol unless it included all nations, or if it would have a negative impact on the U.S. economy.

At the third meeting of the COP in 1997 in Kyoto, Japan, the U.S. delegation followed the Senate's instruction and refused to agree to the terms set for the United States by the U.N. body, because the developing nations refused to accept any reduction in their carbon emissions. The impasse lasted well into the second week of the meeting.

Then, Prince Albert Gore made his entrance. In a private meeting in his hotel suite, Gore negotiated a deal that completely ignored the Senate resolution, and agreed to accept a legally binding emissions reduction equal to 7% below 1990 levels by 2012, while agreeing to impose absolutely no requirements on developing nations. The Senate was steamed, and Clinton knew better than to transmit the Kyoto Protocol for ratification.

One of the two really good things that George W. Bush did was to withdraw from the Kyoto Protocol altogether. (The other good thing he did was to withdraw from the International Criminal Court).

The United Nations, Hollywood, environmental organizations, and most of the Democrats, squalled, bawled, cursed, and ridiculed "W" for his cavalier, go-it-alone, cowboy swagger. The Kyoto Protocol went into effect without the United States' participation.

The Copenhagen meeting is supposed to produce the successor to the Kyoto Protocol, which will expire in 2012. This new agreement is supposed to set new emissions reductions targets, even more onerous than the Kyoto targets. The same arguments plague the negotiations leading up to the Copenhagen meeting that plagued negotiations in Kyoto: developing nations absolutely do not want any kind of reductions imposed upon them, while insisting that developed nations, especially the United

States, be forced to drastically reduce carbon emissions.

Problem for Obama: he has as much as promised the world that the United States would rejoin the international climate change treaty – regardless of the cost. Apparently, he thought his promise, and his teleprompter would be sufficient to persuade developing nations to join the party. So far, they haven't. His ace-in-the-hole is his "Cap & Trade" bill that he wants signed before the Copenhagen meeting. If he gets his bill, he can tell the developing nations that the U.S. has already done its part, and that he will not sign the Copenhagen agreement unless the developing nations do. Of course, if he doesn't get the Cap & Trade bill before Copenhagen, he may have to develop a new strategy.

Notice the absence of any discussion about the validity of climate change science, or the need to control it? Climate change has nothing to do with the negotiations or the meetings, or the treaties. It never has. Climate change is simply an excuse to construct a monstrous international bureaucracy that meets many times each year in exotic venues around the world. Billions of dollars flow into and out of the climate change industry. No one involved in the climate change business wants to hear anything other than a new horror story to put the fear of catastrophe into appropriators.

Dissent is worse than a dirty word at these U.N. meetings. The actual meetings where negotiations occur are closed. Mercy be unto anyone caught with a tape recorder or video camera in an area other than a lobby of cafeteria, or when accompanied by a U. N. staff member. Literature may not be distributed unless first approved by the U.N. staff. In fact, ordinary people cannot even get into one of these meetings. Only official delegates of a government, approved representatives of accredited NGOs, or approved press professionals can register.

Watch the momentum mount as the December meeting draws closer. Ice caps will melt faster, oceans will rise higher, droughts will be more severe, snow falls will be deeper, ice storms will be slicker, crops will fail more often, men will become impotent, and African pygmies will be recruited by the Boston Celtics – all because of climate change – with the only cure being enslavement by a new Copenhagen Protocol to the Climate Change Treaty.

Obama: Rally the world for climate deal next month

Nov 18, 2009 5:33
http://www.jpost.com/servlet/Satellite?cid...icle%2FShowFull

US President Barack Obama, with China's leader at his side, lifted his sights for a broad accord at next month's climate conference that he said will lead to immediate action and "rally the world" toward a solution on global warming.

Obama and President Hu Jintao talked Tuesday of a joint desire to tackle climate change, but failed to publicly address the root problems that could unravel a deal at the 192-nation conference in Copenhagen: how much each country can contribute to curb greenhouse gases and how the world will pay the billions of dollars needed to fight rising temperatures.

Hu said nations would do their part "consistent with our respective capabilities," a reference to the now widely accepted view that developing nations - even energy guzzlers like China, India and Brazil - should be required only to set goals for reining in greenhouse-gas emissions, not accept absolute targets for reducing emissions like the industrialized countries.

Nonetheless, the symbolism of the world's two largest polluters pledging no half-measures in an agreement during the Dec. 7-18 conference took the sting out of the admission by Obama and other leaders over the weekend that Copenhagen would be only a way station rather than the endpoint envisioned two years ago when negotiations for a new climate treaty began.

Denmark: 65 World Leaders Expected at Climate Change Summit in December

Monday, November 23, 2009
By Jan Olsen, Associated Press
http://www.cnsnews.com/news/article/57564

Copenhagen (AP) - Sixty-five world leaders have said they will attend the Copenhagen climate summit in December, and several more have responded positively to invitations, Danish officials said Sunday.

But the world's top three carbon polluters -- the United States, China and India -- have not indicated whether their leaders will attend the meeting, and that could have a big impact on its chances of reaching a deal.

The nations that plan to send their leaders to Copenhagen include Australia, Brazil, France, Germany, Indonesia, Japan, Spain and the United Kingdom, a Danish official said, speaking on condition of anonymity because he is not an official spokesman.

At a party convention in Odense, Denmark, Danish Prime Minister Lars Lokke Rasmussen said Sunday he was encouraged by the fact that "more than 60" leaders had confirmed their participation.

"This shows that heads of sate and government are ready to fly in, realizing that the political momentum is pointing towards Copenhagen as the place ... to address the outstanding issues so we can conclude an ambitious deal," he said. "To cut through the outstanding issues and make an ambitious deal, then the active involvement of heads of state and government is crucial."

Loekke Rasmussen -- the host and chairman of the climate talks -- last week sent out formal invitations to world leaders in 191 countries to attend the Dec. 7-18 U.N. climate summit in Copenhagen.

The conference had originally been intended to produce a new global climate-change treaty on limiting emissions of greenhouse gases that would replace the 1997 Kyoto Protocol. However, hopes for a legally binding agreement have dimmed lately, with leaders saying the summit is more likely to produce a template for future action to cut emissions blamed for global warming.

President Barack Obama, China's Hu Jintao, and Prime Minister Manmohan Singh of India have not publicly said if they will attend the summit, although U.S. climate delegate Jane Lubchenco has said Obama is "actively considering" that.

However, Obama's advisers say he is working in private to push toward a solution that would yield a binding agreement at a meeting in Mexico next year. Obama raised such issues during a meeting with Rasmussen on the sidelines of the recent Asia-Pacific Economic Cooperation summit in Singapore.

British Prime Minister Gordon Brown, who is among those heading to Copenhagen, said Sunday in a letter to Rasmussen that the meeting needs national leaders "to make the final decisions necessary to achieve agreement."

"I am extremely encouraged that so many heads of state and government have now publicly confirmed their intention to go. This is an important signal and I shall continue to encourage others to do so," Brown wrote.

Britain has pushed other nations hard in recent months to commit to a legally binding treaty at the summit, although Brown has acknowledged that a pact may not be sealed until 2010.

"The Copenhagen agreement must allow for immediate implementation of its provisions, while also including a clear commitment to convert the agreement into an internationally legally binding treaty as soon as possible," he wrote to Rasmussen.

Brown will hold talks with Commonwealth leaders at a summit in Trinidad and Tobago next weekend.

Rasmussen also plans to attend those talks.

Revolution Harry - November 25, 2009 02:22 PM (GMT)

On a comment on another site someone claimed that Lord Monckton was not a bone fide member of the House of Lords. On looking at his Wikipedia page I found that he's 'a member of the Worshipful Company of Broderers, an Officer of the Order of St. John of Jerusalem, a Knight of Honour and Devotion of the Sovereign Military Order of Malta, and a member of the Roman Catholic Mass Media Commission.' Make of that what you will.

Op-Ed: Copenhagen climate treaty will create 'world government'

By Jonathan Zappala
Posted on Thursday, December 3rd, 2009, 1:41 am
http://mainecampus.com/2009/12/03/op-ed-co...nment%E2%80%99/

It is fitting that the Copenhagen convention starts Dec. 7, the anniversary of the attack on Pearl Harbor. It's fitting because it is a surprise creation of a world government disguised as a relief of global warming. It could change the world, like America's involvement in World War II did. The current aims of a Copenhagen treaty are to limit carbon emissions of every country that signs it and give the power to enforce penalties on signatory countries that violate the treaty. With the ratification of this treaty, we could see prices of food and energy rise beyond what average people can afford to pay, jobs dying out and a decline in national prosperity.

The Copenhagen summit seeks to create a world government that is responsible for

enforcing the treaty. The other purpose of this treaty is to transfer wealth from countries like America to Third World nations as compensation for “lost opportunities, resources, lives, land and dignity,” as quoted in an early draft of the treaty. This provision goes on to say that compensation is for future damages because “many will become environmental refugees.” This week, the United Nations climate chief Yvo de Boer wants wealthy nations like America to put up $10 billion a year to kick-start the program. This money would be given to Third World countries. The Associated Press says these countries might walk away if not enough money is offered before the treaty is signed. This money is only the beginning of what America will have to give to pay.

The exact carbon emission reductions called for by the draft treaty are 45 percent of the 1990 levels by 2020, and 95 percent of those levels by 2050. The problem is that if no one invents the technology to reduce these emissions, cars that run on gasoline will be banned, every factory with carbon emissions will close, and every coal power plant will be shut down to reach the goal. That will not leave us with enough electricity for everyone, no personal transportation, and food will be hard to get.

If we Americans want out because of the potential decline in our quality of life, we could not leave the treaty. The only way out is if every other country would let us leave, and as the richest nation in the world, that would not happen. The World Bank estimates this will cost between $75 and $100 billion dollars per year. Words like “election” and “democracy” do not appear at all in this treaty, which leaves us without any say. If the treaty is signed, it will take precedence over our Constitution, the very thing that gives us protection from our own government.

We do not need a treaty to save a planet that doesn’t need to be saved. Recent studies show the planet has not increased in temperature over the past 11 years. The global surface temperature record actually has shown statistically significant cooling over the past eight years, and 2009 could be the ninth coldest year on record. Just this week, e-mails were leaked that climate researchers omitted data that would counter an IPCC report. As my major is a science, I am ashamed to see that science could be hijacked to support a political movement. The fact that a “consensus” proves global warming is the politicization of science. Science is not about having a majority. Remember when everyone thought the earth was flat? Look at the facts and ask whether global warming is really happening. Keep an open mind and go where the evidence leads.

Jonathan Zappala is a senior psychology student.

Copenhagen climate summit: Australia's failure to stop pollution threatens climate change deal

Australia has dealt a major blow to any international deal on climate change ahead of

the Copenhagen summit by failing to introduce new laws to control pollution.

By Louise Gray, Environment Correspondent
Published: 4:24PM GMT 02 Dec 2009
http://www.telegraph.co.uk/earth/copenhage...hange-deal.html

The carbon trading bill, which has been rejected by parliament, would have set up one of the world's biggest "cap and trade" markets.

The scheme works by limiting the amount of greenhouse gases industry can produce and forcing them to pay money for any extra emissions by trading with other companies.

But the Australian Senate, that is already deeply divided over the science of climate change, voted down the new legislation.

It is not only damaging to Kevin Rudd, the country's Prime Minister, but could scupper efforts to control greenhouse gases on a wider scale at the UN climate conference in Copenhagen later this month.

Mr Rudd was seen as a leading advocate of tackling climate change on the world stage and was on his way back from a meeting with President Obama on the issue when news of the defeat came through.

Julia Gillard, acting Prime Minister, said the opposition Liberal Party has prevented Australia from fulfilling its role in the fight to stop global warming. She pledged to bring back the legislation when parliament returns from its summer break in February.

"Today the climate change extremists and deniers in the Liberal party have stopped this nation from taking decisive action on climate change," she said.

The defeat is not good news for Mr Rudd's centre left party, that does not have a majority in the Senate. While bush fires and the long drought have made many Australians increasingly concerned about rising temperatures, 'climate change sceptics' command a large number of votes.

Climate change has already claimed one scalp in Australian politics with Malcolm Turnbull, the opposition leader forced to stand down earlier this week after pledging to support the bill.

The defeat is also bad news on the international stage. Any deal at Copenhagen will rely on the rich world agreeing to cut emissions so that the poor countries follow suit and temperatures are kept below 2C (3.6F).

Austrailains emit more greenhouse gases per head than any other country and were seen as an example of what could be achieved if government takes action.

The scheme would have cut emissions from 5 to 25 per cent, depending on whether there is a global deal in Copenhagen.

Frank Jotzo, an Australian National University expert on international climate change negotiations, said the failure of Australia to introduce legislation will make developing countries less likely to agree to cut their own emissions.

"It's not like the talks will stall because of the lack of an Australian emissions trading scheme," he said. "But if the legislation had been passed, that would have sent a very positive signal internationally and, in particular, to developing countries."

UN climate change conference opens in Copenhagen

Dec 7, 2009 13:24 | Updated Dec 7, 2009 13:28
http://www.jpost.com/servlet/Satellite?cid...icle%2FShowFull

The largest and most important UN climate change conference in history opened Monday, with organizers warning diplomats from 192 nations that this could be the best, last chance for a deal to protect the world from calamitous global warming.

The two-week conference, the climax of two years of contentious negotiations, convened in an upbeat mood after a series of promises by rich and emerging economies to curb their greenhouse gases, but with major issues yet to be resolved.

Conference president Connie Hedegaard said the key to an agreement is finding a way to raise and channel public and private financing to poor countries for years to come to help them fight the effects of climate change.

Hedegaard - Denmark's former climate minister - said if governments miss their chance at the Copenhagen summit, a better opportunity may never come.

U.N. leaders: Clock has ticked to zero

By LISA LERER | 12/7/09 11:25 AM EST
http://www.politico.com/news/stories/1209/30292.html

COPENHAGEN — Diplomats, world leaders and United Nations officials warned Monday that the Copenhagen climate talks would be the best – and possibly last – chance to develop a global solution to global warming.

“Political will will never be stronger,” said Connie Hedegaard, the president of the conference. “This is our chance — if we miss this one, it could take years before we get a new and better one, if we ever did.”

Hedegarrd, UN climate chief Yvo de Boer, chief UN climate scientist Rajendra Pachauri and Danish Prime Minister Anders Fogh Rasmussen addressed 15,000 delegates gathered for the opening ceremonies of the UN climate-change conference here.

“The clock has ticked down to zero — after two years of negotiation the item has come to deliver,” said de Boer.

De Boer said that delegates have just eight days to prepare a workable political agreement, before 110 heads of state come to Copenhagen to finalize the deal.

“The time for formal statements is over. The time for restating well-known positions is past,” he told delegates. “I urge you to build on your achievements — take up the work that has already been done and turn it into real action.”

Expectations for the talks have fallen dramatically from earlier this year, when environmentalists hoped negotiators would lead to a legally binding agreement. Now, negotiators aim to ink a framework that lays the groundwork to sign a treaty next year.

“The deal that we invite leaders to sign up on will be one that affects all aspects of society, just as the climate change does,” said Rasmussen.

African Union leader warns of catastrophe if Copenhagen fails

Mon, 07 Dec 2009 16:10:04 GMT
http://www.earthtimes.org/articles/show/29...agen-fails.html

Vienna - African Union leader Jean Ping warned Monday in Vienna that the population

on his continent would disappear if there was no progress at the UN Climate Change Conference in Copenhagen. Africa would speak with one voice at the summit meeting that started Monday, as natural catastrophes like floods and droughts had become a reality in developing countries, the chairperson of the African Union's secretariat told reporters.

"If nothing happens, we will vanish," Ping said at the UN Industrial Development Organization (UNIDO), which was holding its annual general conference.

UNIDO chief Kandeh Yumkella warned of finding solutions at Copenhagen that would burden poor countries. "We don't want climate change to cannibalize development," the director-general said, shortly after being elected for a second four-year term.

Who should pay for developing countries' measures to adapt to climate change is one of the points of contention at Copenhagen.

The Secretary-General of the Association of South-East Asian Nations (ASEAN) said climate change was making itself felt in his region. "It is not somewhere in the future."

The three officials were set to travel to Copenhagen later in the week.

EU expects US to put more on table at climate summit

The Irish Times - Tuesday, December 8, 2009
http://www.irishtimes.com/newspaper/world/...4260296860.html

THE EU delegation at the Copenhagen climate summit, which opened yesterday, has said it would be “astonished” if US President Barack Obama did not put more on the table when he arrives here at the end of next week.

Swedish environment minister Andreas Carlgren, who heads the EU’s negotiators, was referring to the recent US offer to cut American greenhouse gas emissions by 17 per cent by 2020, relative to 2005. This equates to a cut of only 5 per cent, based on 1990 levels.

The EU has unilaterally pledged to cut its emissions by 20 per cent, relative to what they were in 1990, by 2020 and by up to 30 per cent if other developed and major developing countries were to adopt more ambitious targets aimed at tackling the threat of global warming.

Asked at a press briefing if the EU would go for the higher figure to seal a deal in Copenhagen, Mr Carlgren made it clear that this would only arise “during the end-

game" and intended to use the 30 per cent figure as a lever to put pressure on other parties to offer more.

"The EU wants to go to 30 per cent, that is very clear," he said. "The question is whether other parties will go as far, as part of the global effort to limit the rise in temperatures to two degrees. And from our perspective, the US and China are not there yet."

Mr Carlgren made it clear that both the US and China "know what we expect of them". The US offer was a "promising leaning of the curve" but still too low, while China's emissions would still rise significantly despite a recent pledge to cut the "carbon intensity" of its economy.

US chief negotiator Jonathan Pershing insisted the Obama administration still wanted "the strongest possible deal" to be reached in Copenhagen.

Its offer of a 17 per cent cut "puts us on the path to achieve a reduction of 30 per cent by 2025 and 42 per cent by 2030".

He said the US was bringing "an unprecedented level of effort" to the negotiating table and the highest-level delegation to attend a UN climate conference, and he foresaw Copenhagen producing a "political arrangement to be followed by a legal arrangement".

Asked about the impact of "Climategate" – the embarrassing e-mails hacked from the University of East Anglia Climate Research Unit's computer system – Dr Pershing said it would amount to "a small blip in the history of this process" and would have "virtually no effect at all".

As lead author of one of the chapters in the fourth assessment report of the UN Intergovernmental Panel on Climate Change (IPCC), he said it was "shameful" its scientists were now being "pilloried", given the "enormous multitude" of evidence they had presented in 2007.

Dr Rajendra Pachauri, chairman of the IPCC, earlier defended its work in his address to the opening plenary session of the conference. He said some sceptics who found it "inconvenient to accept the inevitability" of climate change were now "resorting to illegal acts".

Wearing a green tie and matching pocket handkerchief, he said the IPCC was proud of its record of independent research by tens of thousands of scientists throughout the world, all of which had been "peer-reviewed" repeatedly by 2,500 scientists in the process.

Yvo de Boer, executive secretary of the UN Framework Convention on Climate Change, said there was "unprecedented political momentum" for a deal in Copenhagen.

But he said it would only be a success “if it delivers immediate action that begins the day the conference ends”.

The “Christmas cake” he envisaged Danish prime minister Lars Lokke Rasmussen lighting the candles on would have three layers: fast funding for developing countries, ambitious commitments to cut emissions, and a long-term shared vision on a low-carbon future.

Opening the conference, Mr Rasmussen told delegates that 110 heads of state or government would be arriving in Copenhagen for the final “high-level segment” at the end of next week, and this reflected “an unprecedented determination to deal with climate change”.

Copenhagen: the AGW druids at Copenhagen know they are on a losing wicket and it shows

Last updated: December 8th, 2009
By Gerald Warner
http://blogs.telegraph.co.uk/news/geraldwa...t-and-it-shows/

Wonderful, wonderful Copenhagen – or is it? For AGW fanatics this was supposed to be the climactic moment, the Machtergreifung that would initiate global government and penal taxes through which the hard-earned money of Western citizens would become a burnt holocaust to the religion of Global Warming, the few remaining heretics would be anathematised and the New World Order would commence.

But it is not working out like that. True, the thousands of parasites – politicians, safely bought scientists, civil servants, myth-compliant journalists and other free loaders have duly converged on the Danish capital. But, for the Climate Moonies, it has turned into a Barmecide feast. Even they know that something is wrong. They are frothing and foaming at the mouth more hysterically than ever – but the world is not listening.

Climategate is the elephant in the room, the skeleton at the feast. Scepticism was supposed to have been eliminated by now; instead, it has captured majority opinion. It is untrue to say that Britain is split 50-50 – though that, in itself, would be a defeat for warmists – close study of all the surveys shows that scepticism was running at closer to 60 per cent – before Climategate even broke. The script said that man-made global warming was to be regarded as an established fact, that sceptics should not even be given the courtesy of an argument.

Now the warmists are on the back foot, thoroughly on the defensive. Even six months

ago, who ever thought that Energy Secretary Ed Milliband would be conceding, on the opening day of Copenhagen, that convincing people of global warming remains a “huge challenge”? Yet it goes beyond even that. I would be the last person on earth to minimise the importance of Climategate or to deny credit, in any way, to those scientists and journalists who have so tirelessly exposed it. And, of course, it has had an important effect.

But there is more than that to the irreducible scepticism of the public. Even before dodgy e-mails emerged, the public was realising that this was a scheme, not to save the planet, but to make Al Gore a billionaire. Gore was trying to charge $1,200 a time for people to shake hands and be photographed with him at Copenhagen. Is that the conduct of a man who urgently believes the planet is about to be scorched to a cinder? Is the United Nations a trusted institution?

The evidence is all around us. Take last weekend’s global warming demonstration in London. It was attended by 20,000 people. In today’s climate of internet communication to organise protests, is that a credible figure reflecting public concern over a global crisis? The Countryside March attracted 407,000 people, the Anti-War in Iraq march 750,000. Subtract from the climate change marchers the smellies who will turn out to bang tin cans to protest against globalisation or global warming indifferently, how much of the British public was galvanised by planetary concern?

“They have science and momentum on their side,” lied a supposedly neutral, but blatantly biased, BBC commentator. In reality, they have neither. Copenhagen is the high watermark of the AGW scam: after this it has nowhere to go but down. The fall of Malcolm Turnbull in Australia and the voting down there of the kind of laws being demanded at Copenhagen shows that electorates are beginning to have their say. Politicians’ rodent whiskers are twitching with fear.
We (I mean by “we” the sane, the scientifically informed, the defenders of freedom, the opponents of socialism and world government) must fight on to victory. We must attack, discredit, harass and, if necessary, disobey climate laws and refuse to pay AGW taxes, until this evil pseudo-religion is thrown into the dustbin of history. Even the mere passage of time disproves global warming. There is an unexpected defensiveness and lack of confidence detectable behind the blowhard utterances at Copenhagen. There is a change of pulse. They are on a slippery slope. We are going to win this one.

Copenhagen climate conference opens to dire warnings

By Richard Ingham and Marlowe Hood (AFP) – 1 day ago
http://www.google.com/hostednews/afp/artic...3jRCWg5OwWxvJAA

COPENHAGEN — A landmark conference on tackling climate change opened here on Monday, with negotiators from 192 countries aiming toward a deal to ward off global warming's potentially catastrophic effects.

The meeting will climax on December 18 with more than 100 heads of state or government in attendance.

Opening ceremonies began with a short film featuring children of the future facing an apocalypse of tempests and desert landscapes if world leaders failed to act today.

"There will be hundreds of millions of refugees," Rajendra Pachauri, head of the UN's panel of climate scientists, said in the film.

"Please help save the world," said a little girl, plaintively.

Danish Prime Minister Lars Loekke Rasmussen told opening ceremonies that the world is looking to the conference to safeguard humanity.

"The world is depositing hope with you for a short while in the history of humanity," Rasmussen said. Poll: Public want action

"For the next two weeks, Copenhagen will be Hopenhagen. By the end, we must be able to deliver back to the world what was granted us here today: hope for a better future."

After opening statements, negotiators from 192 countries were to embark on a gruelling round of talks under the UN Framework Convention on Climate Change (UNFCCC) before around 100 leaders attend a summit on December 18.

Delegates must craft a blueprint for tackling man-made "greenhouse" gases blamed for trapping solar heat and disrupting Earth's fragile climate system. Reducing carbon emissions: the options

They must also put together a funding mechanism for helping poor nations most exposed to the potentially catastrophic effects of climate change.

If all goes well, world leaders will agree a political deal that sets down the course of action, including a roster of national pledges.

Further negotiations are expected to take place in 2010 to fill in the details. A legally-binding treaty would take effect from the end of 2012.

Analysts, though, stress the deep gap between the demands of developing countries and the willingness of rich countries to dig both into their pockets and into their carbon emissions.

US President Barack Obama is hoping to push through a new deal after the United States -- the world's biggest economy -- rejected Kyoto under his predecessor, George W. Bush.

But the US Congress is still hammering out legislation to cut emissions, and Obama's opponents have been emboldened by a scandal over leaked emails from academics that they say raises questions on the science behind climate change.

The chief US negotiator in Copenhagen, Jonathan Pershing, blasted so-called Climategate as a non-affair and "opportunistic".

"It just happens to be the topic of the moment. It is a misrepresentation of the robustness of science," he said.

"... There are many data sets and they all show the same true type of change, (of) significant damages. I look at this and I think to myself, it's opportunistic."

Across the globe, 56 newspapers published the same editorial telling their leaders to agree on action to limit temperature rises to 2.0 degrees Celsius (3.6 degrees Fahrenheit) or risk seeing climate change "ravage our planet".

"We call on the representatives of the 192 countries gathered in Copenhagen not to hesitate, not to fall into dispute, not to blame each other but to seize opportunity from the greatest failure of modern politics," the editorial said.

The Copenhagen conference venue has been declared UN territory, with about 15,000 delegates, journalists and observers from grass-roots organisations attending.

Another 19,000 who registered will not be admitted, as the venue has reached capacity.

More than half of all of Denmark's police force has been deployed to the capital and police warned they would act swiftly to quell any violent protests. Scene: Copenhagen braces for climate protests, sideshows

The ABCs Of The Copenhagen Climate Change Treaty – A World Government, Brutal New World Taxes And The Creation Of 700 New Bureaucracies

Posted on 09-12-2009
http://thetruthwins.com/archives/the-abcs-...w-bureaucracies

Most Americans seem to think that the world leaders gathered at the U.N. Copenhagen

climate change summit are simply discussing ways to help improve the environment. Unfortunately that is not anywhere close to the truth. The draft of the Copenhagen climate change treaty now circulating would represent a giant step towards a "world government", it would establish brutal new world taxes which would transfer massive amounts of wealth from the United States to other nations, and it would create 700 new bureaucracies to enforce this new treaty. Not only that, but according to the provisions of the treaty, the United States would never be able to get out of it. The wording of the treaty makes it crystal clear that no future president, no future Congress and no future U.S. court would be able to extricate the United States from this horrific agreement.

An earlier version of the Copenhagen climate change treaty can be found here. However, the version of the treaty now being circulated in Copenhagen is not available to the public at this point.

Fortunately, there are some officials who have seen the latest version and who are willing to speak out. One of them is Lord Christopher Monckton - a former official in the Thatcher administration.

We already knew that the Copenhagen Treaty was going to be incredibly bad, but according to Lord Monckton it is going to be even worse than we anticipated.

So just what is this horrific treaty going to do?

#1) A World Government

The Copenhagen Treaty is going to be a gigantic step towards world government. Lord Monckton recently said the following about what the drafters of this treaty are trying to do.....

"Once again they are desperately trying to conceal from everybody here the magnitude of what they're attempting to do – they really are attempting to set up a world government."

The wording of the treaty creates governmental bodies with a vast array of power over environmental affairs. The treaty gives these new governmental bodies tremendous power over the lives of every man, woman and child on earth. It even grants these new governmental authorities authority over the U.S. government and the U.S. Constitution.

When you have world governmental authorities that can micromanage the smallest details of our lives and that can trump the U.S. Congress and the U.S. Constitution, what do you have?

World government.

#2) Brutal New World Taxes

The Copenhagen Treaty will also establish crushing new taxes which will further devastate the economy of the United States and which will transfer massive amounts of wealth to developing nations.

This is what Lord Monckton had to say about the taxes in the Copenhagen Treaty.....

"Tax the American economy to the extent of 2 percent GDP, to impose a further tax of 2 percent on every financial transaction….and to close down effectively the economies of the west, transfer your jobs to third world countries – all of that is still in the treaty draft."

To illustrate just how massive these new taxes would be, he pointed out that they would amount to at least half of the entire U.S. defense budget.

That is huge.

So where would all of this money go?

It would be transferred to third world nations to help them build "green" economies and it would go towards running the new socialist world governmental bodies.

This would be a blow that the U.S. economy may never recover from. Already the U.S. economy is coming apart like a house of cards.

What would these new taxes do to it?

#3) Creation Of 700 New Bureaucracies To Enforce The Treaty

According to Lord Monckton, the Copenhagen Treaty will create 700 new bureaucracies to enforce the provisions of the agreement.....

"We’re looking at a grab for absolute power and absolute financial control worldwide by the UN and its associated bureaucracies and 700 new bureaucratic bodies."

This would not mean 700 new officials.

This would mean 700 new bureaucracies.

700 new organizations that would be crawling all over the world micromanaging the lives of every man, woman and child - making sure that they are adhering to the edicts of the new environmental world laws.

Lastly, perhaps the most ominous provision of this treaty is that it states that once a nation has signed on to it, it may not ever cancel its membership without the approval of all the other member nations.

Do you understand what that means?

It means that unless every single other nation agrees, the United States can never, ever get out of it.

Ever.

No future president would be able to do anything.

No future Congress would be able to do anything.

The United States of America would be under the thumb of this treaty forever.

We would be obligated to pay their world taxes forever.

We would be obligated to transfer our wealth to other nations forever.

We would be obligated to submit to the extremist regulations of world environmental bodies forever.

Are you starting to get the picture?

tommetass - December 16, 2009 08:21 PM (GMT)

Question:

Why are they continuing the COP15 conference after the "Global Warming" scam was brought to the public with this Climate-gate hack?

If it's a (now proven) scam, then why is there any need for it to continue?

kalongi - December 17, 2009 06:40 PM (GMT)

U.N. chief weighs in on climate talk expectations

Secretary-General Ban Ki-moon says he expects a final treaty to be signed by mid-2010. He also defends the U.N.'s role as the overseer of funding from developed to developing nations.

By Bruce Wallace
December 16, 2009
http://www.latimes.com/news/nation-and-wor...0,1781040.story

Reporting from The United Nations - As negotiations for a global climate change convention entered their final stages in Copenhagen, U.N. Secretary-General Ban Ki-moon sat down with Times Foreign Editor Bruce Wallace to discuss the prospects for a deal, and whether rich nations are looking to curb the United Nations' role in overseeing the billions of dollars that may be transferred from the developed to the developing world.

Ban said he expected to see a final, legally binding agreement signed by the middle of next year.

Is a political deal in Copenhagen still possible?

We need to have a very strong, robust, binding political deal that will have an immediate operational effect. This is not going to be a political declaration, just for the sake of declaration. It is going to be a binding political deal, which will lead to a legally binding treaty next year.

I'm a perfectionist -- sort of. Everybody wants to have a perfect deal.

But if we insist on agreeing to everything upfront, all the nitty-gritty in Copenhagen, then it may lead us nowhere, to no agreement at all.

There has been talk of reducing the U.N.'s role in future climate change policy and allowing Western-led institutions to oversee how the developing world spends any money it receives from developed countries. Can there be a deal that excludes the U.N.?

How can you scrap the role of the United Nations? The United Nations has global reach.

The United Nations will be there and should be involved in this implementation process.

One of the principles agreed upon is that all commitments should be reportable, measurable and verifiable. This is what has been agreed by both developed and developing countries.

We will establish a global governance structure to monitor and manage the implementation of this. Experts from both worlds should participate.

Do developed countries owe a carbon debt to developing countries?

Developed countries have political and moral responsibilities, therefore they have to do more, first of all by coming out with ambitious targets to reduce greenhouse gas emissions, and they should be prepared to provide financial support.

We have pretty good agreement on short-term, fast-track financial support in the order

of $10 billion for the coming three years. When we agree on a politically binding agreement, this will have immediate operational effect, including financial support from next year.

Does President Obama's decision to attend this week mean a deal is likely?

The U.S. has had very serious, in-depth bilateral engagement with China and India.

And I believe that the fact that President Obama has agreed to participate himself may suggest that the U.S. has some better understandings on what China and India will do. He has been instrumental in changing the political dynamics of this debate.

kalongi - December 21, 2009 11:15 PM (GMT)

Gordon Brown calls for new group to police global environment issues

December 21, 2009
Ben Webster, Francis Elliott
http://www.timesonline.co.uk/tol/news/uk/a...SS&attr=3392178

A new global body dedicated to environmental stewardship is needed to prevent a repeat of the deadlock which undermined the Copenhagen climate change summit, Gordon Brown will say tomorrow.

The UN's consensual method of negotiation, which requires all 192 countries to reach agreement, needs to be reformed to ensure that the will of the majority prevails, he feels.

The Prime Minister will say: "Never again should we face the deadlock that threatened to pull down those talks. Never again should we let a global deal to move towards a greener future be held to ransom by only a handful of countries. One of the frustrations for me was the lack of a global body with the sole responsibility for environmental stewardship.

"I believe that in 2010 we will need to look at reforming our international institutions to meet the common challenges we face as a global community." The summit failed to produce a political agreement among all the countries. Delegates instead passed a motion on Saturday "taking note" of an accord drawn up the night before by five countries: the US, China, India, Brazil and South Africa.

Despite being the first world leader to join the summit, Mr Brown was excluded from the key meeting where the compromise was decided.

Ed Miliband, the Climate Change Secretary, admitted today that the results of the

Copenhagen conference were “disappointing” because of the absence of agreement on emissions targets or a deadline for turning the accord into a legally binding treaty.

Mr Miliband pointed the finger of blame at China for resisting a legal agreement and its rejection of a proposal for 50 per cent cut in global greenhouse gas emissions by 2050.

Efforts to give legal force to the commitments in the Copenhagen accord came up against “impossible resistance from a small number of developing countries, including China, who didn’t want a legal agreement”, he said.

Challenged over accusations that the agreement reached in Copenhagen failed to protect poor people in developing countries, Mr Miliband said: “The eventual outcome was disappointing. But the idea that walking away from agreement would have been better for people facing climate change is frankly ridiculous.

“I think we can protect and help those people’s lives and indeed protect them from climate change through this agreement.

“The fact is that we have got fast-start finance of $10 billion a year flowing as a result of this agreement.” He said it was important that countries had agreed for the need to make emissions cuts, even though they had failed to commit to specific targets.

“We won’t know the precise shape of [the national emission targets] until the beginning of February, and we are going to have to push for them to be higher.

“Even though there were things we didn’t achieve, the fact is we have got for the first time developing countries coming together and saying that they are going to reduce emissions, and the finance is flowing.”

Mr Miliband rejected claims that Britain and the European Union were “sidelined” by their absence from a meeting at which President Obama and the leaders of China, India, Brazil and South Africa thrashed out the basic shape of the accord.

“I don’t think that was the meeting that in the end decided the agreement,” he said. “The big decisions took place in a group of about 30 countries in which President Sarkozy, Chancellor Merkel and Gordon Brown were represented.”

In the accord

• Agreement that “deep cuts in global emissions are required according to science”

• “Long co-operative action” needed to keep the global temperature increase below 2C

• Rich countries should submit proposals for economy-wide emission reduction targets for 2020 to the UN by January 31

• By the same date, developing countries should produce plans to cut the rate of growth of their emissions

• There should be international monitoring of any emission cuts in developing countries that are funded by rich countries

• A reassessment of the accord by 2015 to check whether emission reductions are on track to keep the temperature increase below 2C

• Consideration in 2015 of strengthening the goal to 1.5C

Not in the accord

• Emission targets, either for 2020 or 2050

• A date by which global emissions should peak

• Any deadline for turning the accord into a binding treaty

• A commitment on how much of the climate protection funding would be additional to existing overseas aid pledges

• Agreement on an international body to verify the emissions reported by each country

kalongi - February 2, 2010 10:30 PM (GMT)

Copenhagen - the Munich of our times?

Page last updated at 16:36 GMT, Tuesday, 2 February 2010
http://news.bbc.co.uk/2/hi/science/nature/8490935.stm

The Copenhagen Climate Accord was a failure of historic proportions that is hardly worth the paper it is printed on, says Malini Mehra. In this week's Green Room, she says climate negotiations need to adopt a new approach that can overcome barriers like national self-interest.

Climate negotiations will never be the same after the Copenhagen climate summit, and the accord reached in the Danish capital may very well prove to be the Munich Agreement of modern times.

The document was an appeasement to major polluters that condemns the world to runaway climate change and declares war on our children.

The conference in December ended with an "accord", with no legal status and dubious

value, as one of its key outcomes.

The political agreement was simply "noted" by governments, not adopted by them. Its very existence, however, could now undermine the architecture established by the UN Framework Convention on Climate Change (UNFCCC) to combat global climate change.

There is much that is wrong with the agreement.

It is not legally-binding, contains no mid-term or long-term targets for emissions reductions, and - critically - does not refer to a "peaking" year for global emissions in order to keep within the "safe" limit of 2C (3.6F) warming since pre-industrial times.

It has also failed to follow the guidance of the UN Intergovernmental Panel on Climate Change (IPCC), which indicates three benchmarks for avoiding dangerous climate change:

• Developed countries must reduce emissions by 25-40% by 2020 from 1990 levels

• Global emissions must peak and then begin to decline by 2020

• Global emissions must decline by 50% by 2050 from 1990 levels.

The Copenhagen Accord contains a reference to the 2C limit, but does not endorse it.

Given that there are no targets, no peaking years, no trajectories for emissions reductions, only vague rhetoric, this is effectively an agreement for business-as-usual.

The Potsdam Institute on Climate Research estimates that a business-as-usual accord will actually set the world on course for a 3-4C (5.4-7.2F) temperature rise.

As this is a global average, the actual warming in many parts of the world - especially in the higher latitudes - will be much larger.

Small island states have feared this for some time, hence their plea that warming must not exceed 1.5C in order to ensure "island survival".

An accord too far

The Copenhagen Accord is a cruel blow for millions around the world who had put their faith in their leaders to deliver on climate protection.

Never before had such a constellation of groups and institutions come together: civil society, faith groups, business and industry, the investment community, scientists, engineers and professional organisations.

Even the UN itself, which ran an unprecedented "seal the deal" campaign, called for urgent action.

Leaders responded to the call and came to Copenhagen, but they did not deliver.

This is a failure of historic proportions because an "encore" will be very difficult.

We now have the modern equivalent of the Munich Agreement.

In 1938, European powers sacrificed Czechoslovakia to Hitler's aggression, thinking this would appease his territorial hunger.

The consequences of this gigantic miscalculation became evident with the unfolding horrors of World War II.

Now we are making a huge miscalculation by allowing the major emitters knowingly to sacrifice the poor and vulnerable parts of the world in exchange for their "right to pollute".

They will put a positive spin on the document, saying it is just a first step; but the reality is that countries as disparate as the US, Canada, Saudi Arabia, China and India have no intention of committing to a legally-binding global climate regime, now or in the future.

Instead, we now have an anaemic "pledge and review" system, which provides little guarantee that emissions will decline as rapidly as they must.

New order

What Copenhagen made blindingly clear is that the world has changed.

We are in a new geopolitical era.

Gone are the days of outdated divisions of the world as "developed" and "developing".

Nations like China and India showed that they were the new power players and would act as nakedly in their self-interest as western powers.

It was their double act, with the US, that delivered this agreement - backed up by a pliant, if somewhat discomfited, Brazil and South Africa, and bounced it on to the rest of the world.

A key lesson from Copenhagen is that the new world order simply does fit comfortably with the archaic systems and processes of the United Nations.

The problem is not with the UN itself, but with its antiquated processes.

Bloc politics at the UN are now at least a decade out of date, and have not permitted the creative emergence of hybrid coalitions from North and South.

Copenhagen made depressingly clear that "political realism" has trumped "climate realism" and that the "G2" powers are incapable of providing global leadership.

We will have to look elsewhere for solutions.

The US and China, aided by others, have acted in their short-term political interest thinking they will be able to "manage" their way out of climate change.

But the climate system is oblivious to the vaunted ambitions of temporal nations, and a kicking is around the corner.

Those who have acted in their national short-term self-interest will find that their actions do not serve their long-term interests in a climate- and resource-constrained world.

The collateral damage of their decisions, however, will be tragic for those less able to cope.

The good news is that nothing is stopping the emergence of new players.

What we need is leadership.

Instead of dysfunctional and anachronistic groupings such as the G77/China, we need new groupings of nations that recognise the perils of climate change and increasingly see their interests as interdependent and intertwined.

Many of the nations that are putting their faith in strong de-carbonisation and green growth national plans - such as the Maldives, Costa Rica, Mexico, South Korea, Brazil, the EU and others - now need to make a common cause.

They need to cross failed "North/South" lines and devise a new politics of climate common security and collective economic prosperity.

With the next climate conference slated to take place in Mexico in November, there is everything to play for.

It may well be that Cancun can, what Copenhagen could not.

kalongi - February 12, 2010 07:38 PM (GMT)

China's fears of rich nation 'climate conspiracy' at Copenhagen revealed

'Conspiracy to divide developing world' will make future talks harder, says leaked government report

Jonathan Watts, Damian Carrington and Suzanne Goldenberg guardian.co.uk, Thursday 11 February 2010 15.30 GMT
http://www.guardian.co.uk/environment/2010...nhagen-document

Rich nations furthered their "conspiracy to divide the developing world" at December's UN climate summit in Copenhagen, while Canada "connived" and the EU acted "to please the United States", according to an internal document from a Chinese government thinktank obtained by the Guardian.

The document, which was written in the immediate aftermath of Copenhagen but has only now come to light, provides the most candid insight yet into Chinese thinking on the fraught summit.

"It was unprecedented for a conference negotiating process to be so complicated, for the arguments to be so intense, for the disputes to be so wide and for progress to be so slow," notes the special report. "There was criticism and praise from all sides, but future negotiations will be more difficult."

The authors - all members of a government environmental research institute - were not part of the Chinese negotiating team, but their paper was commissioned by the environment ministry and circulated internally to the minister, vice-ministers and department chiefs in the days after the conference. The ministry currently plays only a marginal role in climate policy making but many of the paper's observations were echoed by China's chief climate negotiator, Xie Zhenhua, in a recent speech given at Beijing University.

The authors were downbeat about the prospects for international talks and China's position within them. "China, which was in the conference spotlight, played an active and constructive role, but was also under huge international pressure. It is predictable that our country will face a tougher challenge in future climate talks," it says.

Analysing international reaction to Copenhagen, the paper lists a selection of responses from the UN secretary-general, the Chinese foreign minister, the European commissioner, prominent NGOs and major media organisations, including the Guardian. It was written before the publication of the most strident criticisms of China's tactics by Mark Lynas, climate change adviser to the Maldives, and the UK climate and energy secretary, Ed Miliband.

Contrary to those views, the paper argues that the primary goal of China's negotiators was not to spoil the summit, but to resist a deal from rich nations that would put an

unacceptable burden on China and other developing countries.

In their evaluation of the outcome, the officials' top point is that "the overall interests of developing countries have been defended" by resisting a rich nation "conspiracy" to abandon the Kyoto protocol, and with it the legal distinction between rich nations that must cut carbon emissions and developing nations for whom action is not compulsory.

The internal report acknowledges that unity among China's traditional allies in the developing world became harder to maintain in Copenhagen. "A conspiracy by developed nations to divide the camp of developing nations [was] a success," it said, citing the Small Island States' demand that the Basic group of nations - Brazil, South Africa, India, China - impose mandatory emission reductions.

The paper is scathing about the US-led "umbrella group", which it says adopted a position of inaction. Canada, it says, "was devoted to conniving" to convince the world that its pledge of a 3% emissions reduction between 1990 and 2020 is significant, while having no intention of meeting its Kyoto protocol target of 6%.

There are no comforting words for the European Union, which used to pride itself on playing a leadership role in climate talks. "Copenhagen was a setback for the EU", the authors say, in part because Europe "suggested the abandonment of the Kyoto protocol in order to please the US." The ministry has not responded to the Guardian's request for a comment on the leaked paper.

The authors note that the Copenhagen accord which emerged from the summit was not legally binding and lacked a global target for emissions. But it says that overall the accord was a "step forward", noting progress on a consensus to limit global warming within 2C, progress on the funding by rich nations of climate change adaptation measures in poorer nations and a "last minute" compromise by developing nations on the verification of their carbon pledges.

Lynas, who was present at many of the key negotiating sessions, said: "It's astonishing that this document suggests the Chinese really believes the absurd conspiracy theory that small island states were being played like puppets by rich countries. The truth is that the small island states and most vulnerable countries want China and its allies to cut their emissions because without these cuts they will not survive. Bluntly put, China is the world's No1 emitter, and if China does not reduce its emissions by at least half by mid-century, then countries like the Maldives will go under."

He added: "I think these claims of conspiracy are just a bullying tactic, to force more progressive developing countries back into line in case they too start demanding more serious action by China."

Speaking last month, China's chief climate negotiator, Xie - who also serves as vice-

minister of the National Development and Reform commission which controls China's climate policy - also referred to the pressure from small island nations. "The rich nations were completely trying to make conflict among developing countries," he said.

He also described the "international fight on climate change" as a contest for economic development space and stressed that the way forward for China was to put more effort into building a low-carbon economy. "Countries with low-carbon industries will have a developmental advantage," said Xie. "Some people believe this is a global competition as significant as the space race in the cold war. "

The concluding section of the leaked document proposes a series of constructive initiatives. In what appears to be a bid by the environment ministry to play a greater role in carrying out climate-related policy, the report suggests amending air pollution control laws to include greenhouse gas emissions.

The official US version about what happened at Copenhagen is also harsh. Todd Stern, the state department climate change envoy, said this week that the summit "a snarling, aggravated, chaotic event." But America attributes the difficulties to a central divide between those countries - led by China - insisting rich countries bear the entire burden of reducing greenhouse gas emissions and the position held by the US that rapidly emerging countries must also take action. Stern suggested the divide had not been bridged. China, along with India, South Africa and Brazil, had been "ambiguous" in its follow-up commitments to the accord.

Tom Burke, the influential environmentalist and a founder of E3G consultants, said: "There was indeed a lot of work done to get developing nations to put pressure on China. [But] it was not a conspiracy of any kind unfortunately as Britain was acting entirely alone on this front. Neither our EU allies nor the US mounted any kind of diplomatic effort. Pretty well everyone in Copenhagen, not just the developed countries, complained about China's blocking tactics."

Bonn or bust – The UN's last, desperate bid for unelected world government

This entry was posted on Friday, April 9th, 2010 at 1:21 pm
http://sppiblog.org/news/bonn-or-bust-the-...nment#more-1481

Source : From The Viscount Monckton of Brenchley in Bonn

There are not many empty seats in the dismal, echoing conference chamber in the ghastly concrete box that is the Hotel Maritim here in Bonn, where the UN's latest attempt to maneuver the 194 States Parties to the Framework Convention on Climate

Change gets underway today.

The “international community”, as it is now called, is here in full force, in the shape of expensively-suited, shiny-shod bureaucrats with an urbane manner and absolutely no knowledge of climate science whatsoever.

However, one empty chair is a pointer of things to come. The Holy See – a tiny nation in its own right, with a billion citizens around the world – has left its chair empty. And that is significant. If “global warming” still mattered, the Vatican would make sure that its representatives were present throughout this gloomy gathering of world-government wannabes.

This emergency conference, called by the UN’s bureaucrats because they were terrified that Cancun this December might fail as spectacularly as Copenhagen did last year, is a much quieter affair than Copenhagen. Not only has the air of triumphalism gone, after the scandals of Climategate, Himalayagate, Amazongate and so forth, but the belief that “global warming” is a global crisis has largely gone too.

There are a few true-believers left among the national delegates, but more of them than before are open to discussion of the previously-forbidden question – what if the climate extremists have made the whole thing up?

The Chinese Xinhua News Agency, for instance, came up to the table manned by the environmental campaigners of the Committee for a Constructive Tomorrow, which takes a hard-boiled, cynical view of the notion that a tiny increase in the atmospheric concentration of a trace gas is likely to cause a thousand international disasters.

The reporters were genuinely interested to hear that there is another side to the story. Huan Gongdi, the Agency’s senior correspondent in Germany, asked me what I thought of the Copenhagen accord (a waste of time), what was happening in Bonn (a desperate attempt to ram through a binding Treaty that can be put in front of the US Senate before the mid-term elections make Senate acceptance of any such treaty unthinkable), and whether or not there was a climate crisis anyway (there isn’t).

I explained to Mr. Huan that even if the UN had not exaggerated the warming effect of CO2 many times over there was still nothing we could do about the supposed “crisis”, because we were emitting so little of the stuff in the first place.

For the record, I did the sum in front of him. The atmospheric concentration of CO2 today is about 388 parts per million by volume. However, we are adding just 2 ppmv a year to the air. So the warming we cause each year, even if one believes the UN’s wild exaggerations of CO2’s warming effect, is just 4.7 times the natural logarithm of the proportionate increase in CO2 concentration from 388 to 390 ppmv.

Thus, 4.7 ln(390/388) = 0.043 Fahrenheit degrees – less than a twentieth of a

Fahrenheit degree of “global warming” every year. That is all. Putting it another way, it would take almost a quarter of a century with no carbon-emitting activity at all – not a single train, plane, automobile, or fossil-fueled power station – to forestall just 1 Fahrenheit degree of “global warming”.

That is why no Treaty based on controlling the amount of carbon dioxide the world emits can possibly work. And that is why there is no hurry anyway. The only reason for the UN’s sense of urgency – a panic no longer felt by the majority of the delegates here – is that the bureaucrats know the game is up. Opinion polls throughout the free world show that no one now believes a word of the climate extremists’ nonsense any more. If they can’t get a binding treaty this year, they won’t get one at all, and they know it.

I shall be reporting frequently from the conference as events unfold. Check back often at www.sppiblog.org.

Title: problem with global warming... it stopped in 1998

craig-oxley - September 13, 2008 04:46 PM (GMT)

But the Elite need the Global Warming scam to put into action plans from The Iron Mountain Report to help usher in Global Governance -2tuff

There IS a problem with global warming... it stopped in 1998

Bob Carter / London Telegraph | April 10 2006
http://www.telegraph.co.uk/opinion/main.jh...09/ixworld.html

For many years now, human-caused climate change has been viewed as a large and urgent problem. In truth, however, the biggest part of the problem is neither environmental nor scientific, but a self-created political fiasco. Consider the simple fact, drawn from the official temperature records of the Climate Research Unit at the University of East Anglia, that for the years 1998-2005 global average temperature did not increase (there was actually a slight decrease, though not at a rate that differs significantly from zero).

Yes, you did read that right. And also, yes, this eight-year period of temperature stasis did coincide with society's continued power station and SUV-inspired pumping of yet more carbon dioxide into the atmosphere.
In response to these facts, a global warming devotee will chuckle and say "how silly to judge climate change over such a short period". Yet in the next breath, the same person will assure you that the 28-year-long period of warming which occurred between 1970 and 1998 constitutes a dangerous (and man-made) warming. Tosh. Our devotee will also pass by the curious additional facts that a period of similar warming occurred between 1918 and 1940, well prior to the greatest phase of world industrialisation, and that cooling occurred between 1940 and 1965, at precisely the time that human emissions were increasing at their greatest rate.

Does something not strike you as odd here? That industrial carbon dioxide is not the

primary cause of earth's recent decadal-scale temperature changes doesn't seem at all odd to many thousands of independent scientists. They have long appreciated - ever since the early 1990s, when the global warming bandwagon first started to roll behind the gravy train of the UN Inter-governmental Panel on Climate Change (IPCC) - that such short-term climate fluctuations are chiefly of natural origin. Yet the public appears to be largely convinced otherwise. How is this possible?

Since the early 1990s, the columns of many leading newspapers and magazines, worldwide, have carried an increasing stream of alarmist letters and articles on hypothetical, human-caused climate change. Each such alarmist article is larded with words such as "if", "might", "could", "probably", "perhaps", "expected", "projected" or "modelled" - and many involve such deep dreaming, or ignorance of scientific facts and principles, that they are akin to nonsense.

The problem here is not that of climate change per se, but rather that of the sophisticated scientific brainwashing that has been inflicted on the public, bureaucrats and politicians alike. Governments generally choose not to receive policy advice on climate from independent scientists. Rather, they seek guidance from their own self-interested science bureaucracies and senior advisers, or from the IPCC itself. No matter how accurate it may be, cautious and politically non-correct science advice is not welcomed in Westminster, and nor is it widely reported.

Marketed under the imprimatur of the IPCC, the bladder-trembling and now infamous hockey-stick diagram that shows accelerating warming during the 20th century - a statistical construct by scientist Michael Mann and co-workers from mostly tree ring records - has been a seminal image of the climate scaremongering campaign. Thanks to the work of a Canadian statistician, Stephen McIntyre, and others, this graph is now known to be deeply flawed.

There are other reasons, too, why the public hears so little in detail from those scientists who approach climate change issues rationally, the so-called climate sceptics. Most are to do with intimidation against speaking out, which operates intensely on several parallel fronts.

First, most government scientists are gagged from making public comment on contentious issues, their employing organisations instead making use of public relations experts to craft carefully tailored, frisbee-science press releases. Second, scientists are under intense pressure to conform with the prevailing paradigm of climate alarmism if they wish to receive funding for their research. Third, members of the Establishment have spoken declamatory words on the issue, and the kingdom's subjects are expected to listen.

On the alarmist campaign trail, the UK's Chief Scientific Adviser, Sir David King, is thus reported as saying that global warming is so bad that Antarctica is likely to be the

world's only habitable continent by the end of this century. Warming devotee and former Chairman of Shell, Lord [Ron] Oxburgh, reportedly agrees with another rash statement of King's, that climate change is a bigger threat than terrorism. And goodly Archbishop Rowan Williams, who self-evidently understands little about the science, has warned of "millions, billions" of deaths as a result of global warming and threatened Mr Blair with the wrath of the climate God unless he acts. By betraying the public's trust in their positions of influence, so do the great and good become the small and silly.

Two simple graphs provide needed context, and exemplify the dynamic, fluctuating nature of climate change. The first is a temperature curve for the last six million years, which shows a three-million year period when it was several degrees warmer than today, followed by a three-million year cooling trend which was accompanied by an increase in the magnitude of the pervasive, higher frequency, cold and warm climate cycles. During the last three such warm (interglacial) periods, temperatures at high latitudes were as much as 5 degrees warmer than today's. The second graph shows the average global temperature over the last eight years, which has proved to be a period of stasis.

The essence of the issue is this. Climate changes naturally all the time, partly in predictable cycles, and partly in unpredictable shorter rhythms and rapid episodic shifts, some of the causes of which remain unknown. We are fortunate that our modern societies have developed during the last 10,000 years of benignly warm, interglacial climate. But for more than 90 per cent of the last two million years, the climate has been colder, and generally much colder, than today. The reality of the climate record is that a sudden natural cooling is far more to be feared, and will do infinitely more social and economic damage, than the late 20th century phase of gentle warming.

The British Government urgently needs to recast the sources from which it draws its climate advice. The shrill alarmism of its public advisers, and the often eco-fundamentalist policy initiatives that bubble up from the depths of the Civil Service, have all long since been detached from science reality. Intern-ationally, the IPCC is a deeply flawed organisation, as acknowledged in a recent House of Lords report, and the Kyoto Protocol has proved a costly flop. Clearly, the wrong horses have been backed.

As mooted recently by Tony Blair, perhaps the time has come for Britain to join instead the new Asia-Pacific Partnership on Clean Development and Climate (AP6), whose six member countries are committed to the development of new technologies to improve environmental outcomes. There, at least, some real solutions are likely to emerge for improving energy efficiency and reducing pollution.

Informal discussions have already begun about a new AP6 audit body, designed to vet rigorously the science advice that the Partnership receives, including from the IPCC. Can Britain afford not to be there?

THE NONSENSE OF GLOBAL WARMING

by William Hunt
January 22, 2007
http://www.newswithviews.com/NWVexclusive/exclusive113.htm

Global Warming; Science Trumped by Politics and Activism

The term “Junk Science” has become popular since the turn of the millennium. Much of what is published by the media and even many mainstream scientists can be thought of as junk science. But, what is junk science? As a scientist and engineer, my definition of junk science is this: the publishing or expounding of “science” theories or “science facts” that directly or indirectly contradict established other scientific facts or principles. Global warming, geologic dating techniques, and uniformitarianism all can be considered junk science as much of the physical evidence argues against them.

It’s always entertaining to watch scientists go off on tangents. One of the great problems of modern science is that researchers of different disciplines rarely talk with one another. When a paper is published in a field that a scientist is not an expert in, cannot know when the results are biased or false and generally assume that the paper’s author was correct in his/her assumptions and methods. Science is too wide a body of knowledge for one to be expert in more than a few fields. The days when a university professor like Newton could be expert in all of the science of his day are long past.

Global warming is an excellent example of this. Scientists and activists alike have jumped on the bandwagon. It’s become a fad, a trend, a wave of enthusiasm and the scientists are going along with the fad to get research grants and the media limelight. The various activist groups are going along with it because it supports their socialist

agenda of wiping out industry and personal freedoms. Global warming has even hit the big screen with “An Inconvenient Truth,” a documentary on Al Gore's campaign to make the issue of global warming a recognized problem worldwide.

So, what is global warming? It is the belief that man has caused the average atmospheric temperatures to increase by his adding of carbon dioxide to the atmosphere by the burning of carbon-based fuels like petroleum, coal and wood. Sounds awful, right? The facts, such as we can observe and calculate them, do not support the idea of man-made global warming. Natural processes completely eclipse anything that man can accomplish- a minor rainstorm expends energy than a large nuclear explosive releases and the lowest category of hurricane expends more energy than all of the nuclear weapons ever produced in a short time. The 1991 eruption of Mount Pinatubo alone put more pollution into the atmosphere than the entire history of man. Consider that a moment. Most geologists and indeed, most scientists in the U.S. do not accept the idea that global warming resulting from human activities is a viable theory -because most have an appreciation for the kind of power inherent in natural systems. Conversely, most biologists do accept the idea of man-caused global warming and quote scientists in other fields, without understanding those other fields sufficiently to make a logical judgement as to whether the studies were reasonable in their methods and claims. They simply take it on faith that the scientists propounding global warming are correct in their methods and assumptions. Geologists point to a period of much warmer weather prior to the Little Ice Age of 1350-1850 A.D., in which it was possible to farm in most of Scandinavia, Canada and even in Greenland (the name was not a joke). It is too cold to farm in Greenland, northern Canada and all but the southern tip of Scandinavia. Historians speak of times in the distant past when the earth was much warmer than now, such as prior to the fifth century A.D. or the 11th century B.C., when northern Europe was similar to the Mediterranean in overall climate. Imagine shirtsleeve weather in the Baltic in winter.

The activists and the scientists proponing global warming point to increased levels of carbon dioxide in the atmosphere over time. Unfortunately, there are no records of long term monitoring available except at one station in the Hawaiian Islands. While those trying to prove global warming point to the station as proof of increasing carbon dioxide, a crucial error was made in location. In the 1950s, the Scripps Institute thought it would be a good idea to have a carbon dioxide monitor in a place far from other land and possible interference from industry, such as the “Big Island” of Hawaii. A reasonable idea, but their choice of location was very poor. What the Scripps Institute didn’t take into account was that volcanoes produce enormous amounts of steam, carbon dioxide, sulfur dioxide and other gases. Compounding that, the Big Island’s volcanic eruptions have increased in recent years to the point where they are causing air pollution on Oahu, some 200 miles away.

The placement of the station next to major carbon dioxide sources like this and then claiming that the entire world’s carbon dioxide levels are increasing is similar in principle

to putting a sensor next to a steel mill's smokestacks and then saying that the air in the entire U.S. is filled with soot. It's dishonest and misleading. I digress, but Oregon's DEQ did the same thing in the 1980s to prove that the Rogue Valley (southern Oregon) had high levels of carbon monoxide. They placed a carbon monoxide sensor half a city block from an old factory whose inefficient boilers were producing large amounts of carbon monoxide. When the factory closed, the levels of carbon monoxide dropped by half and the DEQ claimed that the levels had dropped for the entire Rogue Valley when most of what the sensor had been measuring was the gas from the factory's boilers. A true measure would have been to have sensors all over the Rogue Valley. Carbon dioxide is the same. To get a true measure of world levels of carbon dioxide, one needs sensors in many places and over a long period of time. We simply don't have the data to indicate that carbon dioxide has decreased or increased over time.

When Science Contradicts Science

When established facts and scientific principles argue against a theory, then that theory must be untrue or partially untrue. A rock can't fall down and fly up at the same time. Part of the scientific method is to test hypotheses again and again and then revise an overall theory on the basis of what the tests indicate. Not so with global warming. For example, the claim has been made that ice cores from Greenland and other areas of "permanent" ice caps indicate increasing carbon dioxide. One must consider the nature of glaciers and carbon dioxide before making such a claim. Glaciers flow because the ice softens and flows at about 150 feet from the surface. Carbon dioxide is inert and since carbon dioxide it's less dense than ice, the carbon dioxide in the ice near the bottom of the ice is going to be squeezed upward in the ice, i.e., the upper ice layers will have more carbon dioxide than lower ice because it moves upward over time. One can see the same effect in the basalt flows of Oregon, such as that of the Cascades or the Table Rocks. When the lava flows across the surface, gas bubbles move upward as the basalt flows and cools. In light of the movement of carbon dioxide in glacier ice, it is not reasonable to claim that carbon dioxide levels are higher in the newer material near the top of the ice as the result of increasing carbon dioxide levels in the atmosphere. In addition, since the Greenland ice caps that they are drilling cores from didn't exist before the Little Ice Age, how can they believe that they are taking the measure of thousands of years? The oldest ice can be no more than ~600 years old!

Unfortunately, most activists and many scientists will simply discount information like that as it directly contradicts their idea. In effect, they are saying, "It must be true, so these contradicting facts must themselves be in error." Thus, we have global warming, geologic dating, evolution, string theory and several other scientific dogmas that must somehow be true, but do not fit the evidence or physical laws as observed. I don't have that kind of faith. I can't believe in "science" that is contradicted by other science. Something either fits the evidence consistently or it doesn't. Simply wanting something to be true doesn't make it true, today's postmodern culture notwithstanding. If I hit my hand with a hammer while driving a nail, it's going to hurt and it is a fact that my hand

was hit. Convincing myself that I didn't hit my hand might make be feel better, but it doesn't change the objective reality that my hand was struck and a bruise is now forming.

So, what does temperature data indicate? Temperature data that indicates cooling, such as the winters of 2003-2004 and 2004-2005, in which the U.S. east of the Rockies had unseasonably cold weather for several months, are completely ignored in order to make the case that the earth is warming. One hears the media scream about the warmest years in history, but is this accurate? Temperatures in rural areas of the U.S. have dropped slightly in the last few decades. More than a hundred years of temperature records in the U.S. confirm this. Urban temperatures have increased, but this is a phenomenon local only to urban areas- brought about by asphalt and concrete absorbing more heat than the prior ground cover. For example Bend, Oregon is now warmer on average than Redmond, Oregon and ten years ago this was not the case. The population doubled in Bend during this period and with that population increase came a dramatic increase in the amount of asphalt and concrete replacing the native ground cover. The larger area surrounding Bend, however, is still colder than Redmond. In the same way, urban temperatures are not an indicator for the world's temperatures in general.

A 2002 NOAA study claimed the "certainty" of global warming by comparing seawater temperatures from 50 years ago with the present, yielding an "increase" of 0.5 degrees. This is not a sound analysis of the information that they had to work with. The movements of ocean water are very complex. Current locations and temperatures vary from year to year. Temperature measurements are far more consistent in method, more accurate and much more widespread than 50 years ago. The current system of fixed and moving buoys in multiple locations around the globe providing constant temperature data didn't exist 50 years ago and instruments are now much more precise. One half of a degree falls within the error of the instruments available 50 years ago and thus cannot be used to prove a warming trend.

Astrophysicists state that Mars and the other planets have warmed up considerably in the last decade. All of the planets share the same heat source- and the sun is not constant in its output, varying from year to year. For example, carbon 14 studies of bristlecone pine tree rings in California and Nevada indicate that there is considerable variability in solar irradiation. Venus used to be used as an example of the "greenhouse effect", until other scientists pointed out that Venus receives twice as much energy from the sun as the Earth does, has little water, no life, no plate tectonics and it's atmosphere is very different.

Every climate model from the 1980s on that indicated warming was proven wrong in its predictions. Most models indicated 3 to 6 degree temperature rise in the upper latitudes. This has not happened. The problem with computer modeling is that only a tiny percentage of the literally millions of variables involved can be written into a

program. It's currently impossible for us to accurately model Earth's climate and we are not aware of all of the variables yet. For example, only recently has it been discovered that the solar wind, sunspots and coronal mass ejections from the sun affect weather patterns.

If global warming were to occur, there would be several indicators. The first would be the increase in seawater temperature. This has not happened that we know of. The second would be a dramatic increase in precipitation in essentially all parts of the world, not just a few. With warmer sea temps, there would be greater evaporation and thus more rain and snow, everywhere. Deserts would become steppes. Steppes would become forest. Boreal forests would become rainforest. This hasn't happened in the centuries since the industrial revolution began.

These examples illustrate the basic problem of modern science: there is no field of science in which this same type of error does not take place. This is compounded by activists who want their ideas to be true, regardless of the actual facts, by scientists craving media attention and a media that thrives on sensationalism.

For over a decade, we have had the UN and the Democrats trying to restrict carbon dioxide emissions in the U.S. on the basis of global warming, despite that it would severely damage the economy and restrict personal freedoms. Wishful thinking by some scientists and environmental activism are no basis for making public policy.

Tsunami hits Japan after massive quake

11 March 2011 Last updated at 13:10
http://www.bbc.co.uk/news/world-asia-pacific-12709598

The most powerful earthquake to hit Japan since records began has hit the country's north-east and triggered a devastating tsunami.

Japanese TV showed cars, ships and buildings swept away by a vast wall of water after the 8.9-magnitude quake.

A state of emergency has been declared at a nuclear power plant but officials said there were no radiation leaks.

At least 40 people have been killed by the quake, which struck about 400km (250 miles) north-east of Tokyo.

The region has been rocked by a number of powerful aftershocks.

The tremor, measured at 8.9 by the US Geological Survey, hit at 1446 local time (0546 GMT) at a depth of about 24km.

A tsunami warning was extended across the Pacific to North and South America.

The Red Cross in Geneva warned that the tsunami waves could be higher than some Pacific islands, Reuters news agency said.

Coastal areas in the Philippines, Hawaii and other Pacific islands were evacuated ahead of the tsunami's expected arrival.

New Zealand later downgraded its alert to a marine threat, meaning strong and unusual currents were expected.

Wall of water

Strong waves hit Japan's Miyagi and Fukushima prefectures, officials said, damaging dozens of coastal communities.

Kyodo news agency said a 10-metre wave (33ft) struck the port of Sendai in Miyagi.

Japan's NHK television showed a massive surge of debris-filled water sweeping away buildings, cars and ships and reaching far inland.

Motorists could be seen trying to speed away from the wall of water.

Farmland around Sendai was submerged and the waves pushed cars across the runway of the city's airport. Fires broke out in the city's centre.

A state of emergency was declared at the Fukushima power plant after the cooling system failed in one of its reactors when it shut down automatically because of the earthquake.

The local government urged 2,000 nearby residents to evacuate the area as a precaution. Prime Minister Naoto Kan said no radiation leaks at that power plant or any of the other reactors in the quake-hit zone had been detected.

The UN's nuclear agency said four nuclear power plants had shut down safely.

Police and local officials said at least 40 people had been killed in the earthquake and tsunami. It is believed the death toll could rise significantly.

A ship carrying 100 people was swept away, Japanese media reported, quoting police in Miyagi. It is not clear what happened to the ship and its passengers.

In Iwate prefecture, also near the epicentre, an official said it was difficult to gauge the extent of the destruction.

"Roads were badly damaged and cut off as the tsunami washed away debris, cars and many other things," said Hiroshi Sato, a disaster management official in Iwate.

The earthquake also triggered a massive blaze at an oil refinery in Ichihara city in Chiba prefecture near Tokyo, engulfing storage tanks.

There were reports of about 20 people injured in Tokyo after the roof of a hall collapsed on to a graduation ceremony.

Residents and workers in Tokyo rushed out of apartment buildings and office blocks and gathered in parks and open spaces as aftershocks continued to hit.

Areas affected by the quake

Many people in Tokyo said they had never felt such a powerful earthquake.

In central Tokyo, Jeffrey Balanag said he was stuck in his office in the Shiodome Sumitomo building because the elevators had stopped working.

"There's no panic but we're almost seasick from the constant rolling of the building," he told the BBC.

Bullet train services to northern Japan were halted and rapid transit in Tokyo was suspended, stranding many workers in the city centre.

Narita airport outside Tokyo was initially closed but later opened for departing flights.

About four million homes in and around Tokyo suffered power outages.

In a televised address, Mr Kan extended his sympathy to the victims of the disaster and said an emergency response headquarters had been set up.

Japanese earthquake: Eyewitness accounts

11 March 2011 Last updated at 09:49
http://www.bbc.co.uk/news/world-asia-pacific-12711152

A massive earthquake has hit the north-east of Japan, triggering a tsunami that has caused extensive damage.

Japanese television showed cars, ships and even buildings being swept away by a vast wall of water after the 8.9-magnitude earthquake.

The quake has sparked fires in several areas including Tokyo, and numerous casualties are feared.

Here BBC News website users in Japan recount their experience of the moment the quake struck.
Mike Hall, Hokkaido

I live in Hakodate, which is on the southern most peninsular of Hokkaido.

We have been really lucky, my apartment was shook up for several minutes, a few things fell over etc but there was no major damage.

It is very much like a swaying rolling motion, with jolts that really put the fear of God in you.

Initially, I didn't pay any attention as we've had earthquakes before. But this time, it went on for longer and there were several big aftershocks. The last one was about an hour ago (1000 GMT).

Power and water supplies are fine at the moment and cell phones and the internet seem unaffected. But we have a major tsunami warning in effect.

The bay area of the city has been flooded, though I'm not sure how badly.

We haven't had any visits from local emergency wardens or city officials. Most of the information has come through the various news broadcasts
Yukiko, Tokyo

I have never felt such strong quake in my life.

My flat is on the fifth floor (British fourth floor) and the building shook slowly at first, then more and more violently. It was really scary.

TV is showing a fire in a tall building in the Odaiba area in Tokyo, and also tsunami waves carrying lorries and cars. It looks like there are more fires breaking out in Sendai, a major city in northern Japan.

Until a few minutes ago I was with neighbours who jumped out of the building and shared what little information we had and consoled each other.

Lifts have stopped in our building, and I guess have in most buildings. There are still aftershocks every few minutes.
Ryosuke, Tokyo

Although we're far from northern Japan, the quake here was very big.

The first quake was very long - everyone in the office was screaming. Then we had another long one about 30 minutes after that. Paper and items were falling off the desks. We can hear the walls. We can hear the walls going back and forth.

Things have started to calm down now and some people have started to get back to work.

Transportation has all stopped. The company has asked us to stay in the office.
Robert Koch, Tokyo

Everything that is meant to be inside is now outside. My beloved audio system is trashed as is the CD collection.

Thank goodness it did not happen at midnight with my four-year-old son at home.

None of the trains here are running, buses seem to be fine and no-one here has been hurt. It was just really scary being in a high-rise building during an earthquake. My flat looks like a bomb has hit it.

There is almost a buzz of excitement around. I live about 20 minutes away from central Tokyo. Being a South African, one is not very used to ground that ripples and wobbles under your feet.
Jeffrey Balanag, Higashi-Shimbashi, Tokyo

The quake shook and rolled our building in Shiodome Sumitomo Building.

We are stuck in our offices because elevators are stopped. We are watching the TV which is showing the tsunami rushing landward.

The trains have been stopped. We can see Yurikamome Line and JR Yamanote Line stopped.

We can also see fires. You can see the fires across the bay in the Odaiba area.

There is no panic but I am almost seasick from constant rolling of the building.

Queen offers condolences after Japan quake

11 Mar 2011
http://www.google.com/hostednews/afp/artic...2b649a29d9f.751

LONDON — The Queen has sent of message of sympathy to the people of Japan expressing her sadness at the "tragic loss of life" caused by the earthquake, Buckingham Palace announced on Friday.

More than 90 people were killed in the massive 8.9-magnitude earthquake that hit Japan on Friday, unleashing huge tsunamis along its Pacific coast, public broadcaster NHK reported.

In message conveyed to the emperor of Japan Queen Elizabeth II said: "I was saddened to hear of the tragic loss of life caused by the earthquake which has struck north east Japan today.

"Prince Philip joins me in extending our heartfelt sympathy to your Majesty and the people of Japan

"Our prayers and thoughts are with everyone who has been affected by the dreadful disaster."

Earlier Prime Minister David Cameron offered his condolences and said Britain would do what it could to help.

"The first thing is to offer sympathy and condolences to the Japanese people," he said as he went into an emergency talks on Libya.

"We have had a terrible reminder of the destructive power of nature."

The devastating quake left many people injured in coastal areas of the main Honshu island and Tokyo, while TV footage showed widespread flooding in the area.

The Foreign Office has set up a helpline on 020 7008 0000 for anyone in the UK concerned about the safety of friends and relatives in Japan.

Foreign Secretary William Hague earlier chaired a meeting of the government's emergency Cobra committee in Whitehall to discuss the earthquake.

Speaking after the meeting he said: "We are in touch with the government of Japan to offer our assistance and we have just been reviewing what assistance we could provide.

"That may take the form of humanitarian assistance, search and rescue teams or victim identification -- whatever assistance is required and whatever the Japanese government would like us to send in the coming days."

TheUnhivedMind - March 11, 2011 02:45 PM (GMT)

Residents near nuclear plant told to evacuate

11 Mar 2011
http://www.abc.net.au/news/stories/2011/03...?section=justin

Authorities have urged 2,000 residents living near a nuclear power plant in Fukushima to evacuate after the biggest earthquake in Japan's history hit the region.

Kyodo News reported earlier that an emergency core-cooling unit had been activated at the plant.

The prefectural government issued the evacuation advice for residents in a two-kilometre radius of the No. 2 reactor of the Fukushima No. 1 plant operated by Tokyo Electric Power Co.

The International Atomic Energy Agency (IAEA) says they have received information from Japan that there is a "heightened state of alert at Fukushima Daiichi nuclear plant".

"The IAEA is seeking further details on the situation at Fukushima Daiichi and other nuclear power plants and research reactors, including information on off-site and on-site electrical power supplies, cooling systems and the condition of the reactor buildings," it said.

Japan's prime minister Naoto Kan has already declared a state of atomic power emergency.

But Mr Kan says no radiation leaks have been detected at or near nuclear power plants, and the declaration is so authorities can easily implement emergency relief measures.

Chief cabinet secretary Yukio Edano told a news conference that "we have declared a nuclear emergency state to take every possible precaution".

"Let me repeat that there is no radiation leak, nor will there be a leak," Mr Edano said.

"We ask residents in the areas near power plants to act calmly."

A fire was also burning in the turbine building of the Onagawa nuclear plant in Miyagi prefecture, but Japanese authorities now report it has been extinguished.

Plant operator Tohoku Electric Power said there were no indications of a radioactive leak.

Miyagi prefecture was one of the areas worst hit by the tsunami.

Four Japanese nuclear power plants closest to the epicentre of the quake have been safely shut down, the UN atomic watchdog said.

The quake struck just under 400 kilometres north-east of Tokyo, the US Geological Survey said.

It was followed by more than a dozen aftershocks, one as strong as 7.1.

- Kyodo

TheUnhivedMind - March 11, 2011 02:51 PM (GMT)

Notice theres been a COBRA emergency response committee meeting today. Is this about the Nuclear Reactor in the region of the Earthquake or is it about the Middle East or is it even about the Economy? Are more events to come in order to bring in Force Majeure on financial contracts?

QUOTE

Japan earthquake: UK will offer assistance

A UK Foreign Office team is investigating the situation on the ground

11 March 2011 Last updated at 14:34
http://www.bbc.co.uk/news/uk-12709694

Britain will offer Japan the assistance it needs after it was hit by a massive earthquake which triggered a tsunami, the foreign secretary has said.

This could be humanitarian assistance or search and rescue teams, **William Hague said, after chairing a meeting of the Cobra emergency response committee.**

There were no known British casualties but UK embassy staff were investigating the situation in Japan, Mr Hague said.

The Queen has sent a message of sympathy to the people of Japan.

Buckingham Palace said she had expressed to Emperor Akihito her sadness at the "tragic loss of life". Prince Charles also wrote to the emperor to say the news had come as a great shock.

The earthquake hit the north-east of Japan at 1446 local time (0546 GMT) on Friday, triggering a tsunami and killing at least 60 people.

It has emerged that the BBC Philharmonic Orchestra is safe after it was caught up in the 8.9-magnitude earthquake as it travelled from Tokyo to Yokohama.

Orchestra manager Fiona McIntosh said it had been a "terrifying experience".

Another Briton, Mike Hall, who lives in Hokkaido and is originally from Newport, South Wales, told the BBC: "Initially, I didn't pay any attention as we've had earthquakes before - but this time, it went on for longer and there were several big aftershocks."

Matthew Holmes, a 27-year-old from Nottingham, was at work in Shimokitazawa, west central Tokyo, when the earthquake hit.

Houses went up in flames as rivers flooded

He described the sensation as "like many shocks, joined up by a feeling of being on a wave".

Search and rescue teams from the UK - International Rescue Corps and Rapid UK - say they are on standby having both formally offered their services.

International Development Secretary Andrew Mitchell said they were on four hours' notice to fly to the disaster zone.

"It is clear Japan has some of the most sophisticated search and rescue people in the world, but if we are asked for any technical or additional support, then of course we will give it," he told BBC Radio 4's World at One.
Guidance

The Foreign Office says it is updating its travel advice for Britons in Japan and the Pacific region.

There are more than 17,000 British nationals resident in Japan, while a further 300,000 UK nationals visit the country each year.

The Foreign Office has given the following guidance:
British nationals should make contact with the British Embassy in Tokyo on +(81) 3 5211 1100 or the Consulate-General in Osaka +(81) 6 6120 5600 and monitor local TV and radio for evacuation information
Friends and relatives of those in Japan can contact the Foreign Office in the UK on 020 7008 0000
Radio stations in the Tokyo area that have emergency information in English include the US Armed Forces station at 810AM and InterFM at 76.1FM
British nationals at evacuation sites should co-operate with the Japanese authorities and clearly identify themselves as British
Those connected with larger organisations such as companies, schools or church groups should also try to let these organisations know of their situation if possible

In a statement Mr Hague said his "thoughts were with the people of Japan at this time".

"We are in contact with the Japanese government and I have asked our ambassador in Tokyo to offer all assistance we can as Japan responds to this terrible disaster.

"We are also working urgently to provide consular assistance to British nationals. Our embassy and consulates-general across Japan are in touch with local authorities and are making contact with British nationals to provide consular assistance.

"We have set up a crisis centre in the Foreign Office to co-ordinate our response and offer advice to anyone concerned about relatives or friends in Japan. We are not aware of any British casualties at this time."
'Power of nature'

Earlier, David Cameron offered the Japanese people "condolences" and said the government would look at how it could help.

The prime minister said: "We've had a terrible reminder of the destructive power of nature, and everyone should be thinking of that country and their people, and I've asked immediately that our government should look at what we can do to help."

British Airways has cancelled its daily Heathrow service to Tokyo's Narita airport and Saturday's services to the UK from both Narita and Haneda.

Virgin Atlantic, which operates daily services to Tokyo from Heathrow, has cancelled Friday's flight to Narita and Saturday's service to the UK.

Japanese Quake Forces Evacuation Near Nuclear Reactor; Oil Refinery Burns

[dohtml]<img src="http://www.bloomberg.com/apps/data?pid=avimage&iid=iNbS66Tmaddg" width=200 height=300>[/dohtml]

By Tsuyoshi Inajima and Yuji Okada - Mar 11, 2011
http://www.bloomberg.com/news/2011-03-11/c...earthquake.html

Residents near a Tokyo Electric Power Co. nuclear reactor were ordered to evacuate because of a possible radiation leak as Japan's strongest earthquake in a century shut power plants and oil refineries.

About 1,800 residents living within 2 kilometers (1.2 miles) of the Fukushima Dai-Ichi No. 1 reactor were ordered to evacuate, said Ryohei Shiomi, spokesman at the Emergency Information Center of the Nuclear and Industrial Safety Agency. Residents within 10 kilometers were told to stay indoors.

Firefighters continued to battle a blaze at Cosmo Oil Co.'s refinery, 40 kilometers east of Tokyo, said Seiichi Aso, a spokesman at the local fire department. The blaze started at the 220,000 barrel-a-day plant's storage tanks, Cosmo Oil spokesman Yusuke Kaneda said. JX Nippon Oil & Energy Corp. said it shut its refineries in Sendai, Kashima, and Negishi.

Millions of homes were without electricity as utilities shut 11 nuclear power reactors. The shutdowns amount to about 20 percent of Japan's 4.6 million barrels a day refining capacity and about 20 percent, or 12 gigawatts, of Japan's total installed nuclear capacity, Sanford C. Bernstein analysts including Neil Beveridge said in a note today.

Reactors operated by Tokyo Electric Power Co., Asia's biggest utility, Tohoku Electric Power Co. and Japan Atomic Power Co. were shut, the trade ministry said in an e-mailed statement. A fire broke out at a turbine building at Tohoku Electric's Onagawa reactor, company spokesman Kazuya Sugawara said, adding that there's no risk of a radiation leak.
Tsunami Kills 26

The 8.9-magnitude quake struck at 2:46 p.m. local time and unleashed a tsunami as high as 10 meters, engulfing towns along the northern coast and killing at least 26 people. The temblor hit 130 kilometers off the coast of Sendai, north of Tokyo, at a depth of 24 kilometers, the U.S. Geological Survey said. A 7.1- magnitude aftershock followed at 4:25 p.m., it said.

The Philippines, Indonesia and Papua New Guinea were among more than 20 countries bracing for a possible tsunami, the Pacific Tsunami Warning Center said.

Tokyo Electric shut seven reactors at its Fukushima Daiichi and Daini atomic plants while three reactors at Tohoku Electric's Onagawa station were halted, the trade ministry's Nuclear and Industrial Safety Agency said in the e-mailed statement. Japan Atomic Power shut the No. 2 reactor at its Tokai plant, the agency said.
Tokyo Electric

More than 3.4 million homes serviced by Tokyo Electric were without power following the quake, Daisuke Hirose, a spokesman for the utility, said today by phone.

Electric Power Development Co. shut its 600-megawatt No. 2 unit of Isogo coal-fired plant in Yokohama, spokesman Hiroshi Nakatani said by telephone.

Tokyo Electric's Kashiwazaki Kariwa, Chubu Electric Power Co.'s Hamaoka and Hokkaido Electric Power Co.'s Tomari nuclear plants are operating, the agency said.

Showa Shell Sekiyu KK said it halted shipments at refineries in Keihin and Yokkaichi. Liquefied natural gas import facilities at Sodegaura, Ohgishima and Negishi weren't affected by the earthquake, Atsuhiko Ashikawa, a spokesman for Tokyo Gas Co. said today.

Officials at ports and energy companies in China, Taiwan, South Korea and Russia said the quake and tsunami aren't expected to affect operations.
Reach China

The tsunami due to reach China's southern Guangdong and Fujian provinces today isn't expected to have a significant impact, the official Xinhua News Agency reported, citing the National Marine Environmental Forecasting Center. There's no need to shut the country's ports, Chen Jianmin, director of the China Earthquake Administration, said in Beijing.

Gao Ting, a media official at China National Offshore Oil Corp.'s liquefied natural gas terminal in Fujian, said she isn't aware of any emergency measures being drawn up because of the tsunami. Spokesmen at PetroChina Co. and China Petroleum & Chemical Corp. said they haven't received reports that their companies' offshore operations have been affected.

Taiwan shut schools and business in its eastern and northeastern counties after the Central Weather Bureau issued a tsunami alert. Taiwan Power Co., the island's biggest electricity producer, expects its two operating nuclear plants on the northern coast to remain safe. They were designed to withstand waves as high as 12 meters (39 feet), said Huang Huei- yu, a company public relations officer.
Sakhalin Island

Operations at the Exxon Mobil-led Sakhalin-1 oil production project on the island off the Pacific coast of Russia are unaffected, Olga Shishkina, a spokeswoman for Exxon said today. She declined to comment on whether the events caused any tanker cargos to be diverted to different destinations.

Russia's Sakhalin-2 venture, which includes an LNG plant with an annual capacity of 9.6 million tons, hasn't been affected because the tsunami warning hasn't been issued for Sakhalin Island, a spokesman said.

Russia has issued a tsunami warning for the Kuril Islands, also known as the Northern Territories in Japan.

Tsunami warning extended to much of Pacific region, but not to U.S. West Coast

March 11, 2011
http://latimesblogs.latimes.com/lanow/2011...west-coast.html

user posted image

Officials widened an alert for possible tsunamis resulting from the 8.8 magnitude earthquake in Japan, covering large swaths of the Pacific Ocean but not California and the West Coast of the U.S. and Canada.

[Update 2 a.m. Friday: Authorities have since issued a warning for central and northern California and Oregon, as well as parts of Alaska. Southern California was under a lower-level tsunami advisory. Check the most up-to-date status on the West Coast and Alaska Tsunami Warning Center's website.]

The latest alerts cover Japan, Russia, many Asia countries and Pacific islands including Hawaii as well as many South and Central American countries such as Chile, Honduras, El Salvador, Nicaragua, Panama, Peru and Colombia.

The Pacific Tsunami Warning Center said that a new warning would be issued as more information becomes available.

In Hawaii, officials expect a wave could hit at 2:59 a.m. Hawaii time (4:59 a.m. PST).

California, Alaska, Washington, Oregon and British Columbia are not included in the warnings.

something to bear in mind re: japanese disclosure during nuclear incidents

historically the japanese have been incredibly bad at disclosing just how serious incidents are at their nuclear facilities.

case in point a couple of years ago there was news broadcast which had footage of a fire at a nuke plant playing in the corner of the screen whilst a japanese nuclear spokesman was telling the press no fire had occurred

Partially this is japanese cultural pride (inability to admit they fucked up) partially its the nuke industries tortoise shell approach to the reaction of the public to incidents and partially its covering up criminal negligence

the point is unless they've had a "sea change" (pun intended) in their approach to full disclosure of problems on nuke stations you can pretty much assume they are presently under stating just how serious this is.

Nuclear reactors do not 'explode' they meltdown:

QUOTE

Fears nuclear reactor will explode as 'out of control' cooling system fails at plant

By Daily Mail Reporter
Last updated at 2:58 PM on 11th March 2011
http://www.dailymail.co.uk/news/article-13...t-crippled.html

Japan has declared a state of emergency at a nuclear power plant after its cooling system failed following today's massive earthquake.

So far officials have said there is no leak of deadly radiation from the crippled facility in Onahama city, about 170 miles north-east of Tokyo in the Fukushima prefecture. But around 2,800 residents within a two-mile radius of the plant have been ordered to evacuate the area.

Chief Cabinet Secretary Yukio Edano said the nuclear power plant developed a mechanical failure in the system which cools the reactor after it was shut down in the earthquake.

Ablaze: An oil refinery is on fire in Chiba city - just one of many fires sparked by the 8.9 Richter scale earthquake - the sixth biggest ever recorded

Disaster scene: The Fukushima No. 1 power plant run by the Tokyo Electric Power Co. at Okuma in northern Japan, pictured in 2008

He said the measure was a precaution, there was no radiation leak and the facility was not in immediate danger.

Plant workers are now scrambling to restore cooling water supplies, but warned there was no prospect for an immediate success.

It is understood that water levels at the facility have not reached critical levels.

But while workers at the nuclear facility battled to restore normal function, a huge fire engulfed a natural gas facility in Chiba Prefecture near Tokyo.

Flames soared hundreds of feet into the air from the terminal which is based in the sea and felt the full force of the earthquake.

The nuclear plant's owners confirmed that water levels inside the reactors at its Fukushima-Daiichi nuclear plant were falling but it was working to maintain water levels to avert the exposure of nuclear fuel rods.

Tomoko Murakami, leader of the nuclear energy group at Japan's Institute of Energy Economics, said there did not appear to be an imminent danger of a radiation leak.

'Even if fuel rods are exposed, it does not mean they would start melting right away,' she said.

'Even if fuel rods melt and the pressure inside the reactor builds up, radiation would not leak as long as the reactor container functions well.'

Fire: Flames lick the sky at a natural gas facility in Chiba, near Tokyo, after the structure felt the full forces of the quake

But Mark Hibbs, a nuclear expert at the Carnegie Endowment for International Peace, warned that the situation could turn grave.

'This is no laughing matter,'he said, referring to unconfirmed reports that one or more of the emergency diesel generators for the cooling system were not working.

He said there was serious concern in Japan whether the cooling of the core and removal of residual heat could be assured.

'If that does not happen, if heat is not removed, there is a definite danger of a core melt ... fuel will overheat, become damaged and melt down.'

A spokesman for Tokyo Electric Power, which operates the facility, confirmed that water levels inside the reactors were on a falling trend, but added it was working to maintain water levels to avert the exposure of nuclear fuel rods.

The company has been trying to restore power to its emergency power system so that it can add water to the inside of the reactors, the spokesman added.

The Onahama plant is one of ten nuclear power plants in the Fukushima district.

The quake also started a fire in a turbine building at another nuclear power plant in Onagawa in the neighbouring Miyagi prefecture, but the reactor building was reported to be secure.

Tohoku Electric Power said smoke was observed coming out of the building, which is separate from the reactor, and the cause was under investigation.

The company also said there have been no reports of radioactive leaks or injuries.

The International Atomic Energy Agency, the world's nuclear watchdog, said today that it was seeking further details about the situation at a Japan's Fukushima Daiichi nuclear power plant.

'The IAEA is seeking further details on the situation at Fukushima Daiichi and other nuclear power plants and research reactors, including information on off-site and on-site electrical power supplies, cooling systems and the condition of the reactor buildings,' the IAEA said in a statement.

Professor Tim Abram, a nuclear fuel technology expert at Manchester University, said that as long as a reactor is shut down, it is considered 'benign' until bosses decide it is safe to be turned back on.

He said: 'All nuclear facilities are designed to withstand seismic events.
'The magnitude of the seismic event that they are designed to withstand varies from country to country.

'It's not done on a case of a particular point on the Richter scale, but instead on the basis of probability of earthquakes in particular countries. In somewhere like Japan, the probability will be much, much higher.'

The professor said although a failure in the cooling system of a nuclear power plant was 'unexpected', once a reactor is shut down, the heat levels plummet anyway.

He said: 'Reactors shut themselves down automatically when something called "ground acceleration" is registered at a certain point, which is usually quite small. It will instantly drop control rods into the core.'

At that stage, he said, the heat of a nuclear station drops dramatically in a matter of seconds, and within a couple of minutes, it is down to under five per cent of its normal temperature.

He added: 'That's a tiny, tiny percentage of the usual power output of the core.
'You still need to get rid of the decay heat, but the system is very capable of doing that.

'It's a bit like a braking system on a car failing when it is travelling at 3mph, when it is designed to slow it down from 120.'

Indonesian volcano erupts hours after Japan earthquake

The Associated Press, Updated: March 11, 2011
http://www.ndtv.com/article/world/indonesi...arthquake-91063

Manado, Indonesia: One of Indonesia's most active volcanos has erupted, sending lava and searing gas clouds tumbling down its slopes.

Volcanology official Agus Budianto said Friday that authorities were still trying to evacuate residents living along the slopes of Mount Karangetang.

There were no immediate reports of injuries or serious damage.

The 5,853-foot (1,784-meter) mountain is located on Siau, part of the Sulawesi island chain. It last erupted in August, killing four people.

Indonesia, the world's largest archipelago, is located on the so-called Pacific "Ring of Fire," an arc of volcanos and fault lines encircling the Pacific Basin.

The eruption happened hours after a massive earthquake in Japan that triggered a Pacific-wide tsunami.

Meanwhile, thousands of people are fleeing their homes in northeastern Indonesia after officials warned that a tsunami up to six feet (two meters) high could hit coastal areas following a massive earthquake near Japan.

Some jumped in cars and motorcycles and headed to high ground as sirens blared. Others huddled in mosques or were brought to police stations or army barracks.

In Indonesia, alerts were issued along a 1,100-mile (1,770-kilometer) stretch of coastline, from North Sulawesi province to Papua. Indonesia was hardest hit by the 2004 Indian Ocean tsunami that claimed more than 230,000 lives.

Bering sea water temperature, headed down

Posted on July 19, 2011 by Anthony Watts
http://wattsupwiththat.com/2011/07/19/beri...re-headed-down/

Apparently, not all the Arctic is warming to script. This is an interesting graph from PICES, titled The Bering Sea: Current Status and Recent Events.

Fig. 1 Time series of water temperatures at the Bering Sea mooring M2 (56.87°N, 164.03°W). Top panel: Daily depth-averaged water column temperatures. Bottom panel: Daily temperature anomalies at M2 (blue = negative and red = positive, left

ordinate) and the percent of ice cover over the mooring (ellipses, right ordinate). Figure courtesy of Phyllis Stabeno and Nancy Kachel, NOAA.

It is accompanied by this text:

Normally, a moderate El Niño (as in winter 2010) would have resulted in a warmer Bering Sea and La Niña in winter 2011, and weakening in spring would have supported cooler conditions. However, in recent years it appears that the location of the Aleutian Low had more influence on the Bering Sea in 2010 and 2011 than did the intensity of the low or the ENSO connection.

Additionally, the report suggests the ecosystem of the Bering sea is not so bad after all, with plankton and fish volume on the rise.

There's too much to reproduce here, read the entire article at PICES here:

Sulawesi Volcano Eruption Interrupts Education of Thousands

Dessy Sagita | July 19, 2011
http://www.thejakartaglobe.com/news/sulawe...housands/453799

Thousands of children in Tomohon, North Sulawesi have been unable to attend classes this week due to eruptions, earthquakes and elevated danger levels stemming from nearby Mount Lokon.

National Disaster Mitigation Agency (BNPB) spokesman Sutopo Purwo Nugroho said more than 2,727 students in elementary and junior high school have been encouraged to enroll in emergency classrooms set up at various evacuation shelters.

“Another alternative is to send the students to the schools nearest to the shelters,” Sutopo told the Jakarta Globe.

The BNPB and the local Education Office are coordinating efforts to ensure that students can still receive lessons regardless of the situation.

“We will create study groups according to the students' age and level. Tomorrow [Wednesday], the Education Office will do a final count of the number of students who can go to nearby schools as guest students,” Sutopo said.

Psychologists will also be involved to help students overcome post-disaster trauma.

The 1,580-meter-tall Mount Lokon experienced its biggest eruption on Sunday with huge clouds of ash propelled 3,500 meters into the sky.

More than 5,200 people have been evacuated to temporary shelters since the volcano first erupted on July 10 and its alert status was placed at the highest level.

It last erupted in 1991, killing a Swiss tourist.

The Indonesian archipelago has dozens of active volcanoes and straddles major tectonic fault lines known as the “Ring of Fire” between the Pacific and Indian Oceans.

The country’s most active volcano, Mount Merapi in Central Java, killed more than 350 people in a series of violent eruptions last year.

Deep sinkhole opens under woman's bed

20 Jul 2011
http://news.blogs.cnn.com/2011/07/20/deep-...der-womans-bed/

The first step out of bed could have been a big one.

A woman in Guatemala City reports that a sinkhole, 40 feet deep and almost 3 feet across, opened under her bed Monday.

"When we heard the loud boom we thought a gas canister from a neighboring home had exploded, or there had been a crash on the street," Inocenta Hernandez, 65, said in an Agence France-Presse report.

"We rushed out to look and saw nothing. A gentleman told me that the noise came from my house, and we searched until we found it under my bed," AFP quotes Hernandez as saying.

The area is prone to sinkholes.

In May 2010, a sinkhole about 60 feet across and 100 feet deep opened in the area, swallowing buildings and an intersection.

In 2007, another sinkhole claimed three lives in Barrio San Antonio in Guatemala City.

Hernandez told AFP that she is thankful the surprise under her bed wasn't any bigger.

"Thank God there are only material damages, because my grandchildren were running around the house, into that room and out to the patio," AFP quoted her as saying.

A visible image taken from the GOES-13 satellite on July 20 at 14:45 UTC (10:45 a.m. EDT) and shows a consolidating low pressure area called System 99L in the eastern North Atlantic Ocean, Tropical Storm Bret several hundred miles east of South Carolina, and a large Hurricane Dora off the west coast of Mexico. The image was created by the NASA/NOAA GOES Project at NASA's Goddard Space Flight Center in Greenbelt, Md.

System 99L is a low pressure area that may to reach tropical depression status in the next day or two. It is located about 550 miles east-northeast of Bermuda and is moving to the northeast at 20 mph.

At 2 p.m. EDT on July 20, satellite imagery showed that showers and thunderstorms have become better organized within System 99L. The low-level circulation is also becoming better defined and the storm appears primed to become a tropical depression. If that happens, it would be Tropical Depression 3 (TD3) in the Atlantic Ocean basin. The National Hurricane Center gives it a 90 percent chance of coming together as TD3 in the next 48 hours.

View Full Version: Earthquake hits Uzbekistan, kills 13

Title: Earthquake hits Uzbekistan, kills 13

TheUnhivedMind - July 21, 2011 01:22 AM (GMT)

Earthquake hits Uzbekistan, kills 13

A powerful earthquake struck a densely populated region of Uzbekistan on Wednesday killing at least 13 people and injuring dozens more.

11:11PM BST 20 Jul 2011
http://www.telegraph.co.uk/news/worldnews/...n-kills-13.html

Eyewitnesses described how the 6.1 Richter earthquake hit the Ferghana Valley shortly after midnight.

"Everybody was afraid. Everything was shaking," Dilaffrus Muminova, a Ferghana resident, said.

"It lasted two or three minutes, if not more."

As well as being home to some of Uzbekistan's largest factories, the Uzbek government considers the Ferghana Valley a breeding ground for militant Islamists and a tinderbox of ethnic rivalries and fighting.

The Uzbek Emergencies Ministry said at least 86 people were injured and 35 people taken to hospital in the earthquake which the US Geological Survey measured at a relatively shallow 11 miles below the surface.

Central Asia is vulnerable to earthquakes. In July 2008, an earthquake measuring 6.6 on the Richter scale flattened a village in the Ferghana Valley and killed 74 people. In the Uzbek capital Tashkent, one of the most prominent monuments marks an earthquake in April 1966 which destroyed the city.

View Full Version: Mini twister spotted over UK town

Title: Mini twister spotted over UK town

TheUnhivedMind - July 21, 2011 01:08 AM (GMT)

What a delightful summer! Mini twister spotted over UK town as torrential rain sweeps Britain

Last updated at 1:12 AM on 21st July 2011
http://www.dailymail.co.uk/news/article-20...ps-Britain.html

Britain's weather took a strange turn today when this mini twister appeared over a UK town.

The tornado-like cloud was seen racing through the sky above Leamington Spa, Warkwickshire, just after 2pm.

It came as torrential downpours hit the country, with severe weather warnings issued by the Met Office.

The twister - or wind funnel - in the sky above Southam, near Leamington Spa, Warwickshire at 2.30pm today

This tornado-like cloud was seen racing through the sky on a day of torrential rain

Forecasters this morning warned of slow-moving showers throughout the day in northern and eastern England leading to surface water flooding.

They predicted some of the showers could produce 10 to 20mm of rain within an hour with a few places receiving 30 to 40mm in total, especially across Yorkshire and the Pennines.

Crowds of onlookers watched as the vortex hovered over Leamington Spa, breaking away from dense storm clouds.

© Carl Spencer / SWNS.com

Crowds of onlookers watched as the vortex hovered over the town, breaking away from dense storm clouds

Web designer Carl Spencer, 25, snapped the twister on his iPhone from his office in the town.

He said: 'It was amazing, I have never seen anything like it in Leamington Spa.
'I was caught in a twister in Namibia three years ago, which was unreal but I never expected to see one in my own home town.

'I was sitting at my desk just after lunch when my colleague shouted across the office that there was a tornado.

Forecasters predicted some of the showers could produce 10 to 20mm of rain within an hour

'I didn't believe him at first, however, when I looked out the window I could see this black twister spinning in the sky.

'It seemed to be shooting out of large grey cloud - it really dominated the skyline.

'It must have been at least 100ft from top to bottom. It was getting bigger and bigger.'

After drifting over the town the twister was spotted over fields near the M42.

The twister was likely to be a funnel cloud - condensed water droplets extending from the base of a cumulus or cumulonimbus cloud.

A Met Office spokeswoman said: 'The weather conditions required for the formation of a funnel cloud usually have to be showery, so a day when heavy showers or thunderstorms occur.

'Funnel clouds are caused by the up and down draughts that can occur within deep shower clouds called cumulonimbus clouds.

'Certain conditions can lead to the rotation of the cloud at its base sometimes a funnel cloud appears.

'Funnel clouds can occur if the right conditions are in place and although are not a sight you see very often, they do happen from time to time.'

Elsewhere today, a 'low risk' of flooding remained in Lincolnshire, northern England and Nottinghamshire, according to the Environment Agency.

Aisling Creevey, a forecaster at MeteoGroup, the weather division of the Press Association, said: 'It looks like the showers will dry out by the late afternoon and by this evening it will be mostly dry.'

Flood warnings were issued for yesterday for the North East, parts of Cumbria, the East of England and the East Midlands.

But the risk of rivers bursting their banks has remained low.

An Environment Agency spokesman said this morning: 'Met Office and Environment Agency staff are on 24-hour alert as slow-moving heavy and thundery showers develop over eastern and northern parts of the country.

'The public are encouraged to tune in to local media for weather forecasts for their area and to keep an eye out for signs of flash flooding.'

Drivers were also warned today to expect traffic build-ups on major routes as the school summer holidays begin this weekend.

The AA said jams were likely from Friday lunchtime, with around 14 million cars expected on the roads.

The AA said routes to south west England were likely to be the busiest, with congestion also expected on main routes to the coast, at cross-Channel ports and at major airports.

And road safety minister Mike Penning urged drivers to check traffic conditions before setting off.

AA patrolman of the year, Keith Miller, said: 'Allow extra time for your journey and, if you can, avoid travelling at peak times.

'Carry plenty of drinking water, food and things to keep the children entertained.'

The Highways Agency urged families to plan their journey and to check traffic and weather before

setting off.

Mr Penning said: 'For many people this will be the longest car journey of the year, often on an unfamiliar route and we want to help them to avoid spoiling the start of their holiday.

'A few moments checking traffic conditions before you set off could take a lot of stress out of the journey.

'There are also plenty of ways to check for updates whenever you stop for a break, which you should do every two hours.'

View Full Version: Jellyfish warning for beach-goers

Title: Jellyfish warning for beach-goers
Description: *[SEAS ARE BEING DAMAGED]*

TheUnhivedMind - July 21, 2011 12:56 AM (GMT)

Jellyfish warning for beach-goers

21 Jul 2011
http://www.thisislondon.co.uk/standard/art...-beach-goers.do

Just when you thought it was safe to go back into the water at UK beaches, scientists have warned that our coastal seas could be turned into a "jellyfish soup" this summer.

The number of jellyfish inhabiting our waters is on the rise according to the Marine Conservation Society (MCS), with pollution, over-fishing and climate change among the theories being used to explain the increase.

After events such as the temporary closure of the Torness nuclear power station in Scotland at the end of June due to swarms of moon jellyfish blocking its water intake cooling systems, the MCS is asking beach-goers to take part in its crowd-sourced survey of jellyfish numbers in the seas to learn more about them.

"There is strong evidence that jellyfish numbers are increasing around the world, including UK seas, and these increases have been linked to factors such as pollution, over-fishing and possibly climate change," said MCS biodiversity programme manager Peter Richardson.

"We should consider jellyfish populations as important indicators of the state of our seas, and the MCS jellyfish survey helps provide some of the information we need to understand more about them."

Species usually seen in British waters are the barrel, moon, compass, blue and lion's mane jellyfish. Those brave enough to get close to the jellyfish are being urged to "look

but not touch", as although most of the species have only a mild sting, some, like the lion's mane, which usually comes as far south as the Irish Sea and Norfolk, have a strong - but none-fatal - sting.

Torness, near Dunbar in Lothian, was shut down for two days after jellyfish inundated the seas near the site.

Local fishermen on three trawlers helped to clear the moon jellyfish from the seas around the station.

EDF Energy, which operates the plant, said the reactors were shut down as a precautionary measure and there was no danger to the public at any time.

Jellyfish are the staple diet of the critically-endangered leatherback turtles, seasonal visitors to British waters who migrate from their tropical nesting beaches to feed on the jellyfish blooms. Examinations of dead leatherbacks stranded on UK shores have revealed that they feed on several species.

View Full Version: Ecolab buys water management firm Nalco for $5.4bn

Title: Ecolab buys water management firm Nalco for $5.4bn

TheUnhivedMind - July 21, 2011 12:35 AM (GMT)

Ecolab buys water management firm Nalco for $5.4bn

Nalco cleans polluted water from floods and oil extraction

20 July 2011 Last updated at 15:47
http://www.bbc.co.uk/news/business-14221645

US disinfectant manufacturer Ecolab has agreed to buy water management firm Nalco for $5.4bn (£3.4bn).

It represents a bet that the US water management business will grow strongly due to global pressures on fresh water supplies and new environmental rules.

The offer values Nalco at 34% more than its closing stock price of $28.87 on Tuesday.

In addition to the purchase Ecolab will also assume $2.7bn of Nalco debt valuing the deal at around $8.1bn.

Demand for clean water

Nalco is involved in treating water from unconventional oil and gas extraction.

Removing gas from rocks, or oil from sands often involves using significant amounts of water which regulators then want cleaned by energy companies.

"We really like the customer base that Nalco serves. Oil and gas extraction process increasingly are going to be very water dependent, as you've got to go deeper to find it," says Ecolab's chief executive Douglas Baker.

Disasters such as the Gulf of Mexico oil spill and flooding in Mississippi have also

increased demand for water treatment, whilst water resources around the world have become increasingly scarce.

Nalco had sales of about $4.25bn in 2010 and operates in more than 150 countries.

Ecolab expects the combined company will have around $11bn in sales.

View Full Version: UPROAR AS BBC MUZZLES CLIMATE CHANGE SCEPTICS

Title: UPROAR AS BBC MUZZLES CLIMATE CHANGE SCEPTICS

TheUnhivedMind - July 21, 2011 12:24 AM (GMT)

UPROAR AS BBC MUZZLES CLIMATE CHANGE SCEPTICS

The BBC has been criticised by climate change sceptics

Thursday July 21,2011
By Nathan Rao
http://www.express.co.uk/posts/view/260164...change-sceptics

THE BBC was criticised by climate change sceptics yesterday after it emerged that their views will get less coverage because they differ from mainline scientific opinion.

In a report by its governing body, the BBC Trust, the corporation was urged to focus less on opponents of the “majority consensus” in its programmes.

It said coverage should not be tailored to represent a “false balance” of opinion if one side came from a minority group.

The report was partly based on an independent review of coverage by Steve Jones, Professor of Genetics at University College, London.

Although he found no evidence of bias in BBC output, he suggested where there is a “scientific consensus” it should not hunt out opponents purely to balance the story.

He highlighted climate change as an example along with the controversy over the Measles, Mumps and Rubella vaccine potentially leading to autism.

On climate change, Professor Jones said there had been a “drizzle of criticism of BBC coverage” arising from “a handful of journalists who have taken it upon themselves to

keep disbelief alive".

A sceptic is not a denier, all good scientists should be sceptics

The report says: "In its early days, two decades ago, there was a genuine scientific debate about the reality of climate change. Now, there is general agreement that warming is a fact even if there remain uncertainties about how fast, and how much, the temperature might rise."

But critics accused Professor Jones of using the report as a cover to "push the BBC's green agenda".

Among them are former Tory Chancellor Lord Lawson, who was accused by the Government's chief scientific adviser, Sir John Beddington, of making "incorrect" claims in An Appeal To Reason, the peer's book on climate change.

Lord Lawson, chairman of the sceptical Global Warming Policy Foundation, said the fact that carbon dioxide levels were rising leading to global warming was not under dispute. However, he added, its extent and effect could not be explained by majority scientific opinion alone.

He said: "The BBC is already extremely one-sided on this issue. They have a settled view which is politically correct.

"The idea that because scientific opinion falls largely on one side you can't have a debate is outrageous. Because there's a strong majority in basic science doesn't mean the issue is off the table, yet the BBC says it should be."

The foundation's director, Dr Benny Peiser, said the report would lead to biased coverage of climate change and stifle any real debate.

He said: "This is nothing the BBC has not been doing for the past 10 years, however. They are completely biased on the issue of climate change and this is nothing more than an effort to push their green agenda."

Dr David Whitehouse, the foundation's editor and a former BBC science correspondent, said the corporation had "lost the plot" when it came to science journalism.

He said the corporation was "grouping sceptics with deniers" which would result in a lack of valid scientific input to its reports.

He said: "A sceptic is not a denier, all good scientists should be sceptics. The BBC has got itself into a complete muddle.

"In seeking to get the science right it has missed the journalism which is about asking

awkward questions and shaking the tree."

But the BBC Trust defended the report. A spokesman said: "The report is not suggesting that climate change sceptics will not have a place on the BBC in future.

"The point Professor Jones makes is that the scientific consensus is that it is caused by human activity. Therefore the BBC's coverage needs to give less weight to those who oppose this view, and reflect the fact that the debate has moved on to how to deal with climate change."

Latest BP Spill in Alaska Was Foreshadowed in Risk Assessment Last Year

by Abrahm Lustgarten
ProPublica, July 18, 2011, 4:55 p.m.
http://www.propublica.org/article/latest-b...utm_campaign=BP

BP's pipes and equipment on Alaska's North Slope – despite nearly $200 million a year in maintenance expenditures – were degrading more quickly than they could be repaired, mechanics said. (Photo by Abrahm Lustgarten/ProPublica)

This post has been withdrawn.

A section of the BP pipeline that leaked thousands of gallons of methanol and oily wastewater into the Alaskan tundra on Saturday was flagged by the company more than a year ago as so corroded it presented an imminent threat of rupture.

Documents obtained by ProPublica last fall listed 148 sections of pipelines that BP said failed its basic inspection criteria. These sections had worn so thin – in some cases to a few thousandths of an inch – that internal BP records said they needed to be replaced, or operated only under reduced pressure. Among the pipelines listed was the one that leaked Saturday: the "Drill Site L1" line at the company's Lisburne Production Center, a large oil gathering facility near the shoreline of the Beaufort Sea.

The spill is the latest in a string of accidents at the Lisburne center and BP's other Alaska facilities that, combined with last year's accident in the Gulf of Mexico, have weighed on the company's reputation. The latest spill is a setback for BP's new CEO, Robert Dudley, who promised to make BP's global operations safer and more reliable after the Deepwater Horizon disaster last spring.

ProPublica wrote then that while attention was focused on the Gulf, BP's Alaska oilfields were deteriorating and presented grave safety and environmental risks. For more than a decade, BP's maintenance of key facilities there had lagged. As the company cut costs, it reduced its use of chemicals and monitoring meant to control pipeline corrosion. It allowed aging pipe valves, large turbines and fire detection systems to age without regular maintenance, according to a series of internal BP documents and reports obtained by ProPublica.

BP's pipes and equipment on Alaska's North Slope – despite nearly $200 million a year in maintenance expenditures – were degrading more quickly than they could be repaired, mechanics said.

"We found that 50 percent of everything that was originally brought up was not fixed, it was ignored," Marc Kovac, a BP mechanic and PACE union representative on the North Slope, told ProPublica in an interview last year. "BP plays the time game. People forget and they know that. So as long as they file reports and do investigations and produce paperwork, they know that people will eventually go on with their business."

Then, last year, BP started cutting back again. From our earlier report:
… even before the enormous costs of the Gulf spill created an estimated $30 billion in BP liabilities, the company was eking out more "efficiencies" in its Alaska budget. It said it would maintain record high funding for new projects and major repairs while reducing its budget for regular maintenance, according to a letter that BP Alaska President John Minge sent to Congress in February 2010. The letter said holding-tank inspections will be deferred and replacement of one pipeline will be postponed; flows through that line will be reduced "to mitigate erosion."

The Lisburne facility, which a ProPublica investigation showed has experienced repeated accidents and spills, processes some 30,000 barrels of oil a day but has been shut down since June for maintenance. The leak was discovered as the pipeline was being tested, according to news reports.

Neither BP nor the Alaska Department of Environmental Conservation immediately responded to requests for comment. We'll update when they respond.

Staff reporter Nick Kusnetz contributed to this report.

View Full Version: Extreme heat wave to spread across Chicago, U.S.;

Title: Extreme heat wave to spread across Chicago, U.S.;
Description: *drough conditions to worsen*

TheUnhivedMind - July 20, 2011 12:39 AM (GMT)

Extreme heat wave to spread across Chicago, U.S.; drought conditions to worsen

Andrei Evbuoma, Chicago Weather Examiner
July 16, 2011
http://www.examiner.com/weather-in-chicago...tions-to-worsen

You know it's bad when you see magenta shadings that represent Excessive Heat Warnings in northern North Dakota and Minnesota.

The expanding dome of intense heat has expanded and will continue to expand over the Lower 48 over the next several days. Currently, as many as 13 states that stretches nearly 1,400 miles from as far north as International Falls, MN south to Temple, TX are under some type of heat advisory.

High pressure systems with intense heat usually migrate further east than normal across the country during this time of year, but not as expansive especially towards the north like this.

Temperatures in the 90s and 100s will occur on a daily basis across the northern Plains and Upper Midwest, regions not used to that type of heat.

These are also regions there is plenty of vegetation, specifically corn, also known as the Corn Belt Region. Humidity levels in these areas will be sent through the roof thanks to a process called evapotranspiration. Water within plants/vegetation changes to water vapor that is released into the atmosphere increasing humidity levels. According to the USGS, 10% of moisture in the atmosphere comes from plants through transpiration. Humidity levels could reach in to the 80s across this region. Combine that with the intense heat and heat indices will soar to near 115 degrees.

Record-breaking to near record breaking temperatures will occur with heat indices that will range from 105 to 115 degrees across many locations this weekend. With the month of July at the midway point, there have already been 882 record high temperatures tied or set across the Lower 48.

The anticipated heat will bring 90+ degree weather to the Chicago region Sunday and Monday. A break in the heat will come Tuesday as winds will turn off the lake. Thunderstorms could also erupt with the lake breeze creating a convergence boundary. The heat and humidity will return by midweek through the end of the week.
Advertisement

Models indicate that this is only the beginning as the heat and humidity will continue until at least the end of July.

The air quality will also become an issue with the anticipated heat and poses a threat especially to sensitive groups. According to the Illinois EPA, an Ozone Action day may be declared as early as today or Sunday.

Drought conditions expected to worsen across the U.S

Not only will the heat be an issue over the next couple of weeks, but the worsening drought conditions. The latest release from the U.S. Drought Monitor showed 29 percent of the country in a drought, mainly across the southern tier states, with 12 percent of the country in exceptional drought, the largest extent on record (though records only go back to 2000).

Of all states, drought conditions continued to be most extensive and intense in Texas, with 72 percent of the state in exceptional drought. But drought conditions have rapidly expanded in Oklahoma, where exceptional drought now covers 40 percent of the state, a marked 10 percent increase from last week.

The New York Times provided an excellent illustration of extreme and exceptional drought conditions over times. According to the graphic, the maximum drought coverage across the nation was at 13%. Currently, the extreme drought conditions cover 20% of the nation.

Rain is possible in the coming days over these drought-stricken areas as the powerful heat ridge complex shifts into the Upper Midwest this weekend into early next week.

TheUnhivedMind - July 19, 2011 03:35 AM (GMT)

Scientists Gagged From Interpreting Study That Links Climate Change To Cosmic Rays

Posted by Alexander Higgins - July 18, 2011 at 12:12 pm - Permalink - Source via Alexander
http://blog.alexanderhiggins.com/2011/07/1...mic-rays-35691/

Head of the world's leading physics lab has issued a gag order preventing scientists from stating their interpretation of a study that links historical climate changes to cosmic rays

For years now scientists and physicists have presented study after study showing data, along with their personal interpretations, supporting the hypothesis that the alleged Global Warming phenomenon is due to man-made environmental factors affecting climate change.

Now, a major scientific experiment to conducted study the interaction between cosmic rays and cloud formation reveals that historical climate patterns coincide with the penetration of cosmic rays into the earth's atmosphere.

However, the Chief of world's leading physics lab at CERN in Geneva who conducted the study has prohibit scientists from presenting their own interpretations of the CLOUD experiment.

Scientists Gagged After Study Links Climate Change To Cosmic Rays

Scientists "Gagged" After Study Links Climate Change To Cosmic Rays

Chief of world's leading physics lab at CERN in Geneva prohibit scientists from presenting their own interpretations of the CLOUD expirement which found a nearly perfect correlation between climate change and the penetration of cosmic rays into earth's atmosphere throughout history.

Some speculate that the "gag order" was issued because the experiment invites a politically unacceptable hypothesis on climate changed, or to say it another way, that Global Warming may not be a human caused phenomenom.

The UK's Register suggests one reason that the "gag order" may have been issued is because the experiment invites a politically unacceptable hypothesis on climate change, or to say it another way, the study shows that Global Warming may not be a

human caused phenomenon.

Under any interpretation the data can simply not be ignored since the study reveals that at the least cosmic rays play some part in climate change and Global warming.

Assuming that Global warming is is occurring, the question of whether cosmic rays are the sole cause or just a contributing factor along with man-made and other issues is really just a red herring.

The real issue here is why are scientist being ordered not to give interpretations of data that would suggest a theory that is contradicts the politically popular view? Is science not allowed to suggest an alternate hypothesis to the man-made Global warming theory even when the data shows otherwise?

Science needs to be factually unbiased and provide information that is independent of a politics.

Many critics of Global warming, and the theory it is man-made, already believe the studies supporting have been fabricated for politicians who paid for skewed data so they can push through their own political agendas.

Clearly this gag order will do little to quiet those skeptics.

The study will also raises another interesting question about the effect that the man-made cloud seeding operations conducted by the government will have on the climate over time.

View Full Version: Los Alamos lab prepares for flooding after fire

Title: Los Alamos lab prepares for flooding after fire

TheUnhivedMind - July 16, 2011 12:31 AM (GMT)

Los Alamos lab prepares for flooding after fire

13 Jul 2011
http://www.businessweek.com/ap/financialnews/D9OEOUI01.htm

LOS ALAMOS, N.M.

Crews at Los Alamos National Laboratory installed barriers to divert water and removed sediment as they work to prevent any trace of nuclear and other contamination from being washed downstream by flooding triggered by a massive wildfire.

Workers also sealed wells and installed sampling stations that will test runoff, lab spokesman Fred deSousa said.

The work is designed to help stabilize canyons and prevent runoff from stirring up trace amounts of Cold War-era contamination.

The Las Conchas fire burned only one acre of lab property but did burn off vegetation in two canyons upstream. Heavy runoff from monsoon storms is expected to cause flash-flooding over the summer.

"There is little doubt that we will see ash in the water reaching the Rio Grande," said Dave McInroy, program director for the lab's flood and erosion control efforts. "This is what you'd expect after any fire in New Mexico. We're working to minimize the transport of any contaminants that have attached to sediments in the canyon bottoms."

Containment of the Las Conchas fire, the largest in New Mexico history, remained at 50 percent Tuesday, but crews were banking on more cloud cover and rain to help them slow the massive blaze.

The fire has charred more than 232 square miles of the Jemez Mountains around Los Alamos and continued to put up columns of smoke that could be seen as far away as Albuquerque on Tuesday afternoon. More than five dozen homes have been destroyed, and firefighters were protecting structures on the southern end of the fire.

Fire information officer Claudia Brookshire said rains helped on the northern end Monday evening and more rain was expected to hit the burned area through the rest of the week.

As of Tuesday morning, Brookshire said fire officials weren't aware of any flooding in the area. There had been no flooding at the lab, deSousa said.

Workers have removed 65 containers of waste soils and debris from environmental investigation sites that are located in the canyon bottoms.

Tanks containing more than 5,000 gallons of water from drilling operations associated with environmental monitoring wells also were removed. All the materials were taken to an area of higher ground on lab property known as Sigma Mesa.

"This is our highest priority right now," said Kevin Smith, manager of the National Nuclear Security Administration's Los Alamos Site Office. "We had employees work through the weekend and the lab has finished this first phase three days sooner than expected."

Los Alamos lab has been the site of nuclear weapons research and production, chemistry and physics studies and work with hazardous and radioactive materials since its beginnings in the 1943 Manhattan Project to develop the world's first atomic bomb.

The lab has been investigating and cleaning up Cold War-era waste sites around its sprawling campus since reaching an agreement with the New Mexico Environment Department in 2005. The consent order set a 2015 cleanup deadline.

Of more than 2,100 sites in existence when the order was signed, about 800 remain. The sites range in size from a small, suspected fuel spill to multi-acre landfills. None of the large sites are in canyon bottoms.

Lab officials said the recent flood preparations come in addition to hundreds of projects since the 2000 Cerro Grande fire, which had also threatened the lab. Previous work included construction of the massive Pajarito flood control structure, earth berms, rock dams and a wetland stabilized by thousands of willow trees.

TheUnhivedMind - July 19, 2011 02:23 AM (GMT)

Indonesian volcano erupts twice in half an hour

Monday, 18 July 2011
http://www.independent.co.uk/news/world/as...ur-2315609.html

A volatile volcano in central Indonesia has erupted again, spewing ash almost 2,000ft (600m) into the air.

Monitoring official Farid Ruskanda said Mount Lokon on Sulawesi island erupted twice within half an hour today.

Mount Lokon has been dormant for years but rumbled back to life late last week.

Yesterday, it unleashed its most powerful eruption yet, spitting hot ash as high as 11,400ft (3,474m).

Some 5,000 people near the mountain have been relocated to safer areas.

Indonesia is prone to earthquakes and volcanoes because it sits along the Pacific "Ring of Fire", a horseshoe-shaped string of faults which lines the Pacific Ocean.

Tropical Storm Bret Is Moving Northeast Off Florida Coast to Open Atlantic

By Charlotte Porter and Lananh Nguyen - Jul 18, 2011 4:04 PM GMT+0100
http://www.bloomberg.com/news/2011-07-18/b...011-season.html

Tropical Storm Bret, the second cyclone of the Atlantic hurricane season, is moving northeast away from the coast of Florida on a track that will take it out to sea, the U.S. National Hurricane Center said.

The storm was about 90 miles (149 kilometers) north of Great Abaco Island in the Bahamas and 183 miles east of West Palm Beach, Florida, with sustained winds of 50 miles per hour, the Miami-based center said today in an advisory at 11 a.m. East Coast time. Storm-force winds extend outward as far as 50 miles from the core, the center said.

Bret was moving north-northeast at about 5 mph. It's expected to turn more to the northeast on a course that will take it into the Atlantic between North Carolina and Bermuda.

The government of the Bahamas issued a storm warning for Grand Bahama Island and the Abaco islands. High surf and 2 to 4 inches (5 to 10 centimeters) of rain may occur in the northwest Bahamas, the center said.

In the Eastern Pacific, a tropical depression formed today off the eastern coast of Guatemala. It may become a tropical storm later today and reach hurricane strength by the day after tomorrow, the U.S. center said.

Title: NY, East May See 100 as Heat Wave Moves In

TheUnhivedMind - July 18, 2011 05:26 PM (GMT)

NY, East May See 100 as Heat Wave Moves In

By Christine Buurma - Jul 18, 2011
http://www.bloomberg.com/news/2011-07-18/n...moves-east.html

Temperatures may rise above 100 degrees in New York this week as a heat wave spreads from the central U.S., boosting energy use in the densely populated Northeast and threatening crop damage.

The National Weather Service today issued an excessive heat watch, meaning temperatures will feel hotter than 105 Fahrenheit (41 Celsius), for parts of Indiana, Illinois, Missouri and Kentucky. The above-normal temperatures will reach the mid-Atlantic by Thursday, said Matt Rogers, the president of Commodity Weather Group LLC in Bethesda, Maryland.

“It’s going to be a pretty intense temperature story for the East Coast by Thursday,” Rogers said. “That hot ridge out in the Midwest is going to flatten and extend to the Eastern Seaboard.”

Forecasts of above-normal temperatures drove natural gas futures to their biggest weekly gain since November last week. Gas for August delivery on the New York Mercantile Exchange rose 3.8 percent as Commodity Weather Group predicted hotter-than- normal weather in the eastern and central U.S. through the end of July.

Power plants use about 30 percent of the nation’s gas supplies, according to the Energy Department.

Temperatures may reach 101 degrees, 16 above normal, on Friday at New York’s LaGuardia Airport, Rogers said. Thunderstorms next week will probably bring cooler

weather to the region, he said.

Southern Heat

The southern central states, including Texas and Oklahoma, probably won't cool off this week, according to Stephen Strum, the president of Frontier Weather Inc. in Tulsa, Oklahoma. High temperatures in Tulsa have been above 90 since May 31 and higher than 100 for 13 of the past 17 days, according to the National Weather Service.

"It's going to stay pretty much as it has been, with temperatures 100 degrees or higher throughout the remainder of the week," Strum said.

More than 40 states will record temperatures in the 90s or higher this week, according to AccuWeather Inc. in State College, Pennsylvania. Temperatures in the Great Plains states will reach 100 degrees or higher from Sunday through Wednesday, said Kristina Pydynowski, a senior meteorologist at AccuWeather, in a blog post today.

Crop Yields

Corn crop yields may be reduced in Iowa, Illinois, Missouri and Kansas amid high temperatures and low rainfall, according to Commodity Weather Group. Corn is the biggest U.S. crop, valued at $66.7 billion in 2010, followed by soybeans at $38.9 billion, government figures show.

Corn may gain for the third straight week and soybeans may rise for a fourth week on speculation that temperatures topping 100 degrees will damage reproducing crops in the U.S. Midwest, according to a Bloomberg News survey.

Twenty-two of 31 traders and analysts surveyed from Tokyo to Chicago on July 15 forecast that corn will rise, and 21 respondents said soybeans will gain.

On the Chicago Board of Trade last week, corn futures for December delivery rose 7.5 percent to $6.85 a bushel, the most in eight weeks, and soybean futures for November delivery climbed 3 percent to $13.87 a bushel.

View Full Version: ANOTHER BP oil spill as 4,200 gallons of the black

Title: ANOTHER BP oil spill as 4,200 gallons of the black
Description: *stuff spill onto the Alaskan tundra*

TheUnhivedMind - July 18, 2011 05:11 PM (GMT)

ANOTHER BP oil spill as 4,200 gallons of the black stuff spill onto the Alaskan tundra

Last updated at 5:45 PM on 18th July 2011
http://www.dailymail.co.uk/news/article-20...lls-tundra.html

BP has reported yet another pipeline leak at its Alaskan oilfields, just over a year after the Gulf of Mexico disaster.

The oil giant said a pipeline at its 30,000-barrel-per-day Lisburne field, which is currently closed for maintenance, ruptured during testing and spilled a mixture of methanol and oily water onto the tundra.

The London-based company has a long history of oil spills at its Alaskan pipelines - accidents which have hurt its public image in the U.S., where around 40 per cent of its assets are based.

The Alaska Department of Environmental Conservation said the spill occurred on Saturday and amounted to 2,100 to 4,200 gallons.

A BP spokesman said the clean-up was under way and the company would determine the cause 'in due course.'

Lisburne, which is managed as part of the Greater Prudhoe Bay Unit, has produced no oil since June 18, according to Alaska Oil and Gas Conservation Commission records, suggesting maintenance work requiring a prolonged shutdown.

The spokesman said the field had been undergoing 'its annual maintenance.'

BP's blown out Macondo well caused the worst offshore oil spill in U.S. history, spewing almost five million barrels of oil into the Gulf and putting BP's future in the U.S. at risk. Enlarge

Previous problems including leaks from corroded pipelines in Alaska and the fatal Texas City refinery blast in 2005 had already earned the company a poor reputation for safety, something analysts say it needs to address if it is to continue to grow in North America.

BP shares were down 1.089 per cent at 454 pence today.

Production from the entire Lisburne field remains shut off while the spill is addressed, Alaska officials said.

Immediate efforts are focused on containment and clean-up, said Tom DeRuyter, state on-scene coordinator for the Department of Environmental Conservation.

The methanol-produced water mix has spread into wet tundra as well as onto a gravel pad, bringing risks to slow-growing vegetation, DeRuyter said.

'You have actively growing plants and they're very susceptible to the contaminants,' he said.

The pipeline will also have to be dug up to allow for an investigation into why it failed, he said.

Resumption of normal operations at that part of the field may require a relatively long wait, DeRuyter said.

'I think they're looking at trying to get that pad back up before freeze-up,' he said.

Maritime countries agree first ever shipping emissions regulation

But campaigners warn rules only apply to new ships replacing older ones – and developing countries have six-year waiver

John Vidal, environment editor
guardian.co.uk, Monday 18 July 2011 17.09 BST
http://www.guardian.co.uk/environment/2011...ions-regulation

Countries have taken a first step towards reducing climate emissions from shipping with a global agreement to reduce energy use in new vessels from 2013 onwards.

The belated action on Friday by 55 of the world's biggest sea-faring nations meeting at UN's international maritime organisation in London will force all ships over 400 tonnes built after 2013 to improve their efficiency by 10%, rising to 20% between 2020 and 2024 and 30% for ships delivered after 2024. The first ever regulation of emissions in shipping is expected to lead to greenhouse gas emission reductions of 45-50m tonnes a year by 2020.

But China, Brazil, Saudi Arabia and South Africa have secured a six and a half year delay for new ships registered in developing countries, which could mean the first guaranteed effective date of the reform will be in 2019. Shipping accounts for 3-4% percent of man-made CO2 emissions worldwide and this figure is expected to rise to 6% by 2020, with emissions doubling by 2050 if no action is taken. Shipowners, who traditionally do not pay for the fuel that their ships use, have long resisted any regulation despite increasing pressure from environmental groups and reformers within the industry.

Environmental NGOs welcomed the tightening of the energy efficiency design index (EEDI) standard but cautioned that because it only applies to new ships replacing older ones at the end of their long lives, the full effects of today's decision will take a long time to have any major impact. There is a significant danger, said some, that many shipowners will elect to have their new ships flagged in developing countries that provide a waiver.

"Today's decision should result in fuel savings of $5bn a year by 2020 and CO2 reductions of 22m tons. This is an unprecedented economic and environmental opportunity and the IMO has taken an important step forward", said Peter Boyd, COO of Carbon War Room.

If the same standards were applied to the existing fleet of more than 30,000 ocean-going ships it could save $50bn a year in fuel and 220m tons of CO2, he said.

"There will be no change to existing ships which are currently pumping out a billion tones of CO2 each year, and for new ships it will take another dozen years until the EEDI is really delivering benefits. Operational changes could be delivering major benefits today," said Jacqueline Savitz, the senior campaign director for the marine conservation NGO Oceana.

The efficiency improvements are expected to be met through better engine design, more efficient hull shapes, improved waste heat recovery systems and the use of hull coatings to make ships more "slippery".

The deal is not likely to satisfy the European Commission that the maritime organisation is successfully regulating greenhouse gas emissions. The EC is therefore expected to proceed with its threat to bring shipping into the Emissions Trading Scheme, as it is doing in aviation, where there have been recent legal challenges from non-European countries.
